On May 13th, 1998, while working at the movie theater, the same opportunity observed in the dream synchronized with a strong déjà vu aura. Going through the motions of the dream at this point, the triangle did form as observed in the dream on the forehead of a co-worker. He was not privileged to this personal research and exploration that I was conducting. However, he felt something and was also able to observe the triangle mark. It was visible enough to be recorded with photographs and I will present the two pictures of the mark.

-- Theory of Precognitive Dreams, Ian A Wilson

Q2: I used to think something similar. I wouldn't really chalk it up to quantum physics or anything, but how much do we really know about how our consciousness is expressed? Probably not a whole lot. If something like multiple universe hypothesis is true-- would there be a real way in which similar consciousnesses (that evolve the same consciousness) can communicate or share. I am no expert-- and this may be a bad analogy-- but what if our conscious "selves" were somehow entangled with each other. It would certainly save a lot of computing power. Maybe sleeping is a way to "sync up." I dunno. I am getting a little too creative here. I think I will leave it at that. If what I am describing is truly a "glitch in the matrix," I have absolutely no way to know how to trigger it, so it is all pure speculation. I should say that my theories and analogies are somewhat weak as I am no expert in how the human brain expresses consciousness. I am keeping this short so that I don't put my foot in my mouth too far haha.

Marcus Arvan's P2P Hypothesis covers similar ground - as does the QBism interpretation of quantum mechanics - in terms of having "private views" of the world, which may (or may not) be synced up at some point. If we continue to think of the world as a "spatially-extended place unfolding in time" which we wander about it, then we are stuck with some form of synchronisation or direct sharing. But if we instead view the world more like a "shared resource" of possible patterns, then it's possible to see it as a toy box of potential experiences, and sharing and synchronisation don't really matter. Then, time and space arise as part of the experience, and make no sense outside of it. We are each having an independent experience with no larger context in time or space. Like sending and receiving pre-written messages via an eternal inbox.

(This and the "strands of thought" concept can be linked up quite nicely.)

Q2: Yeah, I have no idea. I think that if I am in a new reality, not much has changed. There are minor things every now and again that I notice, but my brain is wired to either fix memories to fit reality or to ignore things that don't follow the general narrative of this reality. That is why I called sleep "syncing." If I have woken up in a different reality, I think my brain is wired to keep my conscious self from noticing. And eventually conforming to any new rules or paradigms needed to survive wherever I am. That may sound heavy, but it is an alternate explanation as to why I eventually lost the ability to sense any difference between now and any other reality I have been in. This is, again, pure speculation. But it is how I rationalize it.

Another option is to forget about brains for a minute (I always find the idea that our brains are thinking separately from us and choosing to do things a bit philosophically strange, because what is "us" and what is "it"). We might simply say that the ongoing experience you are having tends to self-reinforce, and so the current state is going to become dominant and the previous state is going to recede as time goes on. As with a Necker Cube, it is very hard to hold two contrary perspectives in the mind at once. the more prominent one configuration of the "world-pattern" becomes, the harder it becomes to perceive, recall, or even think in terms of the other configuration. It's increasingly difficult to hold onto an alternative view when all inbound sensory evidence is to the contrary. I like the idea of "sleep syncing". And what is sleep, if not a release upon your hold of the world for a while? When you wake up the next day, the fading patterns of the now-incongruous perspective have slipped from your grasp completely, and you are fully aligned to your "new reality".

POST: Asked a question. The universe delivered

[POST]

It was a grand summers eve, around 2003. Me, a friend, his wife and kid were sitting in a beer garden discussing different species of fish. He mentioned a fish I was, at present, unaware of, the bullhead. He described it meticulously, but the fish escaped my knowledge. Myself and my friend, while still discussing said fish, went indoors to refresh our glasses. On our return my friends wife looked quite shocked and pointed to this oily looking dark mass on the floor, not two feet from our table. Initially wondering what it was, she went on to explain that it had just fallen from the sky. On closer inspection my friend looked equally shocked. I looked at the thing and quickly realised it was a fish. He looked right at me and said; "Oh my good god, that is a bullhead!". There was a pond nearby, and we surmised a bird had caught the fish and happened to drop it on its flyby. I was stunned, and quite frankly still am. Even when telling this experience now, I still wonder if people believe me. Coincidence, Synchronicity, Glitch? Either way, it was weird.

[END OF POST]

Q1: Some say thoughts can attract real life events to you. I've experienced it on a small scale many times. Who knows.

...That's not really confirmation bias though for most people, is it? I imagine very few people are really living from the hypothesis that thoughts attract real life events.

"In psychology and cognitive science, confirmation bias (or confirmatory bias) is a tendency to search for or interpret information in a way that confirms one's preconceptions, leading to statistical errors."

For most reports, it's probably better described as the general tendency to notice details which are meaningful within your current context. Basically: experiencing synchronicity. Not that you can really test for that (or confirmation bias or the frequency illusion) in everyday life, so the topic will always stay open. Not suggesting that thoughts do attract real life events (mental causation), or even that thoughts tend to arise "near" to similarly-shaped events in some way (event clustering), but scientifically speaking it's not a question that can be investigated one way or the other.

Q2: It's not confirmation bias it's apophenia comorbid wishful thinking.

Well, if you are just noticing that things seem to cluster for you, then that isn't wishful thinking. That's just observation. It's how you interpret that observation that matters. (e.g. "Therefore I Am God Of All Things And You Should Beware My Fiery Power", for instance, is probably not the appropriate conclusion.)

Unless of course you meant that literally: "Wishful thinking" as in, the sort of thinking that makes wishes come true, and you are speaking from personal experience. In which case I will immediately bow down in worship of your great wisdom, in order to avert a sudden charcoal outcome.

EDIT: Responding to your update to include "apophenia", I'm not sure how you're going to separate out actual meaningful data from "seeing patterns in meaningless date". Surely all "life data" is meaningless, other than in the context of the experiencer and their history. (And in fact, the whole idea of applying this concept to everyday life assumes some sort of objective level that has inherent value prior to, and independent of, an experiencer. Personally, I've never encountered anything that I haven't been an observer of.)

Q2: If I could think wishes true, it wouldn't make me wise, it would make me god.

Indeed. Although you could always wish to be wise...

Q2: Which is circular reasoning.

...which is allowed for a god: he is after all pretty much the definition of a bootstrap paradox.

POST: I saw the whole world. I think

[POST]

Hey there reader. I'm tired. Bored. Have been meaning to share this story. Hopefully I'm in the right place. Hopefully my story is worthy. I'll keep it short but descriptive. This happened when I was 15. I was walking through the apartment complex I lived close to with my boyfriend at the time. He turned the corner to walk into the open laundry room to buy a soda from the machine and right as I was about to turn the corner I shot out of my body so fast I didn't even have a chance to really even notice. I was suddenly floating in space. I can't tell you if I felt my body or if I was just looking but I was there, floating, looking at earth and the stars and our universe. It was all so vivid and huge and in front of me. Then before I knew it I was back in my body walking. I nearly fell over and just had to hold the wall and ground myself for a moment. I had no words for what happened. And after my so got his soda and came out I just leaned back up and continued walking with him. I didn't tell anyone, and still haven't. I always felt like it just didn't make sense and people would brush it off as my imagination being super vivid or something if the sorts. I'd like to add that I never experienced anything like that again. And also about a year later I was in and out of the hospital having neurological things checked out (optical neuritis if you must know) and there was nothing wrong (but the neuritis heh). So I have no explanation. I've thought about it so much. Every which way. Was I out of breath? No. Was I on drugs? Haha no. Thanks for reading a little sliver of my life.

[END OF POST]

I don't suppose you maybe stepped on something like this?

Heh, did you like Tomorrowland?

I was anticipating really not liking it but, despite a few missteps such as the handling of the robot agents and a bit of overexplaining, I really enjoyed it for what it was. They could have done more with that concept though.

...

Q1: You do realize why it's hard to believe right?

Why is it hard to believe? He's not saying he was literally, physically in space. It sounds like he had a temporary "blip", like a mini-lucid dream or OBE-type experience. The interpretation is up for grabs, but the actual experience seems pretty plausible.

I think he's a she. Unless...

...unless this glitch was more dramatic than we thought?

POST: Duplicated objects

Yeah, I wasn't suggesting there would be some big adventure involved, but for instance:

- What were the circumstances of discovering the duplicate? Was there just suddenly two pairs in the drawer, or was it a case of opening the drawer, there are some shorts, but - wait - aren't my shorts in my bag?
- Was there any anything noteworthy about the discovery? Like, you were in a rush and needed your shorts for gym, can't find them, suddenly you find a pair, only later you notice the duplication... etc.
- Is the duplicate an exact copy of the original?

Even if it's just "there are two of those now", there's a way in which there are two now. Otherwise there's nothing much to discuss, and you might get a whole lot of one-line replies saying: "I recently had one pair of sunglasses, now I have two", "I recently had one watch, now I have two", with no further info. The idea is that you're kicking off a discussion, right?

Tried to add some more details. It's happened a couple of times with different things, pens, lighters, shirts, shorts.

Great, that's exactly what I meant. Someone finding two identical pens in a drawer they haven't looked in for five years, it's curious, but nothing special. Lots of explanations possible. An item of clothing duplicating itself in a matter of moments while you were actually sorting through them, that's something else!

Yeah, the lighters and pens you kind of expect to vanish and reappear, or even double sometimes but this happened with shorts, and two shirts so that's a little much.

Here's something to ponder: During that activity, leading up to the moment of discovery, were you a bit spaced at all, distracted and dreamy, and was the moment of noticing the duplicate the thing that brought you out of it?

No, not at all it was a very boring moment, other than the duplicated shorts. Maybe it was just so bad that God Himself got bored and decided to create entertainment with my laundry. I guess it was nothing otherwise out of the ordinary.

Yeah, well they do call him The Creator I suppose. Everyone thinks that's because he was responsible for the world and all that's in it, Biblical-style. Actually, though, it's a nickname his deity pals gave him, because he's always (literally) making stuff up.

Including shorts apparently.

You should take it as a compliment. He duplicated your shorts and shirt just as they were, rather than choosing some other style to create. Basically, your fashion choices have been officially approved by The Lord Himself. And being all-knowing and all-seeing, you'd imagine he knows his stuff.

It happened with a shirt once before too, is there a "holy shirt" joke in there somewhere?

I think there definitely is, yes. And if you start getting food duplicates, there might be the possibility of a "god offal" joke too - especially if you start getting tripe-licates.

...might be in bad taste.

Haha, very good! Nice one to finish on. Cheers :-)

...

Uh-huh, and I love how you really brought the story to life; it's almost as if we are there with you.

Sarcastic mod is sarcastic.

The genetic burden of being British. I'd get it treated, but there's a danger my ability to do funny walks will be affected. (You have to admit it's slightly taking the piss, though. I still re-approved the post anyway.)

POST: Dimension shift? Timeline jump?

I think I would be wary of interpreting every small unexplained event as a "dimensional shift" or "timeline jump". Technology is always glitching, in the more literal sense. Now, if when she checked her phone she noticed it and changed from an iPhone into an old Ericsson and that's why there was no long SMS in it, then that would have been a "glitch in the matrix".

Collateral shifts.

A couple of points perhaps to bear in mind: a) the world maybe just isn't that stable anyway, facts are "blurry"; b) technology definitely isn't very stable, it's full of bugs. What it really comes down to is: it's not possible to work out the cause unless you are having experiences that you can tie back to an intentional act. A minor blip could be anything. It's about levels of plausibility, really. If there were lots of odd shifts happening and a dramatic change, perhaps it would be a worthwhile interpretation to explore, but one-off computer file disappearances (which is basically what this is), isn't something to get too hung up on. A failed send message function, and there might be no trace of a message - never made it to "outbox", doesn't get broadcast, doesn't get saved in "sent" either.

Not saying you can't have fun thinking about it; it's just that I wouldn't get overly fixated on this as evidence of anything to do with a "shifting reality".

POST: [THEORY] What if our reality were a computer simulation?

Nick Bostrom is really your go-to-guy for the simulation argument. But really, this is all just a new coat of paint on an old philosophical idea...

The idea that the universe doesn't exist in the same 'format' as our sensory experience - that 3D-space and the passage of time are part of our experiences rather than fundamental - goes back a long way. Following this, we end up with the notion that behind the scenes it's more like an "infinite gloop" which has been patterned in some way, and so our ongoing experiences amount to a series of selected 3D-slices of that patterned gloop. The simulation view, and similar angles, are just the application of the computer metaphor to this idea. One major problem with the simulation metaphor is that it implies that the world in some way is "run" like a software program, which implies a processor of some sort, or some framework operating in time. But this runs counter to the core idea of that philosophical point, which is: the world doesn't actually "happen" at all when it is not being observed, only observations "happen" - because happening (the apparent unfolding of events) is part of experiencing. The world doesn't unfold, only experiences do.

But so long as it's just taken as a "thinking framework" rather than literally true, then it's quite a fun worldview to adopt. (No metaphor can capture the nature of the world beyond experiencing, of course. Experiencing has no "outside". If there was an outside, we could never experience it, and so in effect it doesn't exist. All we can ever do is make up "connective fictions" to link our observations together into a useful narrative.)

Q1: Can it be summarized by stating that it doesn't really matter whether there is a computer running the universe algorithm? That's how I see it: The reality as a computer simulation, with no need for a tangible computer to "run" it. It's like a mathematical series. You don't need to compute infinitely everything to know and state that it does exist.

Right. It's a mathematical landscape, you might say - which is really just a way of saying it has a structure or shape but it has no substrate. It's not "made from" anything (except, in some readings, "consciousness itself" or awareness or whatever you want to call that raw property of being). Nothing runs it, it's a dumb pattern. If anything happens at all, it is us as observers. Experiences happen, the world does not. The intelligence of the universe is our intelligence, as the selectors of experiences from the landscape of all possible moments. And nothing ever happens except for selection ("bringing a moment into sensory awareness").

Q2: It most likely is, my question is, if we can't tell the difference, what does it matter?

If you "can't tell the difference", my question is, how do you conclude that "it most likely is"? ;~)

Q3: The idea works like this. If it's possible to create a simulation that perfectly mimics a real world one of two things will happen when we are able to. Either we'll decide never to do it or we will create at least one, probably more. In the simulations at least some people will likely figure out how to create their own simulation and decide to do it. And so on down the line. That would mean that there is one 'real' universe and who knows how many simulations in that one. There are also simulations within simulations the same way. Leading to untold numbers of simulations and one universe that isn't. So if there are simulations then it's staggeringly unlikely that we are the 'real' universe. It's just a matter of numbers.

Yeah, that's the simulation argument for sure. I don't find it very persuasive though, apart from as a bit of fun; it stinks of "whatiffery". So...

- We can never know if a simulation we create is actually having an experience like we are.
- If we create a world in Sims 4 and the characters within that apparently create a Sims 42 and so on, to the Sims 4n, would that mean it was likely that we are living in a Sims one level above? Surely not.
- Actually, no matter how many simulations we create, it does not necessarily follow that we are in a simulation, because of the issues of 'type' - quite apart from external access. There is really no way of calculating that "likelihood".

Q3: The whole idea is predicated on the ability to create a perfect simulation. One that exactly replicates reality. If that is possible then any people in the simulation would necessarily experience their world exactly how we do. As would anyone in any simulations they create. And so on. From there it's just a numbers game. Odds are we are somewhere in the middle of that chain of simulations, rather than at the top. I don't know if it's true or not, but logically it works.

The problem (which I could have said more clearly!) is that you can't tell whether you've created the perfect simulation, because - putting aside the issue of checking for correspondence - confirming this would involve having an experience from inside of it, as a creation of it. The way out of that is to propose that there is a base level where all the "conscious beings" are, all with goggles on, experiencing different simulations. But then you don't really have simulations within simulations; you have one real level with one actual simulation with multiple simulated-environments.

EDIT: Hmm, actually that is pretty close to a philosophical idealist view I quite like, although in that case the possible experiential patterns are "dissolved into" the conscious beings themselves. (See related exercise here [POST: Why did the devs implement dreams?].)

Q2: That's not my conclusion... that's my opening statement. My conclusion is it does not matter.

As an opening statement, it isn't really a statement of fact. However, I agree with your conclusion.

TriumphantGeorge Compendium - Part 22

POST: My friend's dead brother

Q1: To get to the bottom of it, you'd have to ask him. It will probably be awkward, but just tell him what you thought he said about a year ago to you. Maybe he just thought his brother succeeded in suicide when in reality it was just attempted suicide. If they have to contact over the phone or email it's possible he mentally shut down when he heard the term suicide. It can be a stressful situation. But I will say that's pretty damn weird. Is it possible that instead of being direct with you, he is indirectly implying that he was wrong about his brothers death? Some people don't like admitting they're wrong. I'd kind of be embarrassed if I were incorrect about something that serious. That or I wouldn't really want to talk about it directly, you know?

Q2: I see your point. Also when he said he had to leave because he "had to bury his brother" (his actual words) he was more or less addressing several group members. It was almost an announcement. Maybe I did misinterpret the situation or didn't know everything. I find that it would be quite difficult and awkward to ask him about this. But to get to the bottom of it, I suppose I'll have to ask him.

Could it have been meant metaphorically and with in-the-moment emotional exaggeration?

As in, he gets called up and there's trouble at home with mom not treating the brother well and the brother sounding suicidal, and it's almost just a way of phrasing the desperation of the situation - i.e. "I need to go home, my brother is basically in ruins and as good as dead because of what my mom is doing".

Q3: A. This should be in the Mandela Effect B. Does he have more than one brother?

The lines can blur but... It's not a Mandela Effect unless it's a global fact. If it's only him that remembers it and it's a personal event, it's here.

Q2: I am 98% certain he has only ever had one brother. Also I thought Mandela Effect referred only to things that were relevant to an entire culture, so i posted this in glitch. Sorry if I was wrong about that.

To confirm: this is indeed the correct subreddit for your post.

POST: Requested: My Experience of Dreaming of another Realm. Nearly 4 dream years in 3 nights of time.

Q1: Once at a place I worked, I found myself staring at a cupboard door in the cafeteria wondering why it was a different colour. It had always been white. I could see it was still white, but yet it was also a bluish colour at the same time. I was experiencing an involuntary sort of cognitive dissonance. It was two contradictory things at once. Then my perception shifted. The walls of the room were a different colour - they had been painted pink since I was last there. I had been implicitly assuming that the walls were still their original off-white colour, leading to my other assumption that it must have been the cupboard doors. The doors were now their non-confusing original shade of white, and the walls were pink. This occurred when I was 19 or so. TL;DR Now imagine you're a little kid who's always seen this patch of grass as green. Your eyes telling you one thing (brown), your brain telling you that this grass is green. You feel weird. Your perspective shifts to what your eyes see. The grass seems to change colour in your perception. Whoa. "Daddy!..."

Perhaps we really don't "see" much at all; actually, we are constantly using our "darkroom vision" with only minor updates from the senses (whatever they are). Who knows what is actually "out there"? Maybe it's just a bunch of slightly self-contradictory ideas or patterns, and our minds just try and make a world out of them as best they can.

POST: Requested: My Experience of Dreaming of another Realm. Nearly 4 dream years in 3 nights of time.

[POST]

I originally wasn't going to post this, because of the personal nature of the story, but I received so much encouragement from this community that I decided to post. Because it is so personal, there are a few details I'll be keeping to myself, but feel free to ask questions.

--==- Dream 1 -==--

About a year ago, I fell asleep one unremarkable night and dreamt roughly three and a half years of time. At the beginning of the dream, I was in 10th grade, apparently at a boarding school, or something similar. At the beginning of the dream, I was at school, and another student (who we'll call Dan), and who was only in my chemistry class, asked if I wanted to hang out that weekend. I said that that would be great, and that we'd meet up that Friday after classes. It was to be the first time that we were going to hang out, and I was looking forward to it. We went to his dorm and talked about a few things that he asked me to keep in confidence (and I'll honor that), but it had to do with his relationship with his parents.

I felt bad for him, but I didn't let him see that (as far as I know). We had a great night playing board games, and chatting. (Video games didn't seem to exist, now that I'm thinking about it).

Time went by like it usually would in reality - it didn't feel like a dream at all. It felt like waking up, showering, going to classes, studying for exams, writing essays, eating food, using the facilities, hanging out with friends, celebrating holidays. Everything normal.

As time went by, Dan and I would hang out basically every day. By the time the summer rolled around, we were inseparable. I spent almost every day with him at his house. (He lived with his parents who were extremely wealthy. The house was so large, I'm not even sure they noticed I was around half the time. Or him, for that matter. I helped him cope with the issues with his parents, and he helped me cope with the other students that, for some reason, were very angry at our friendship, and took it out on me. I grew to love him as a brother. (I was an only child, in the dream).

Two more years go by this way. he lived at my place (with my folks), the summer between 11th and 12th grade. By 12th grade, things were basically as great as they could be. The anger at us seemed to have died down, and we were participating in all kinds of school events. We had great marks in all of our classes, (I'd've called them grades, but that's not what they were called in the dream) and Dan and I were both in the top 10 of our graduating class. A few months before we were to graduate, on a wholly unremarkable Wednesday I woke up.

--==-

It really felt that the previous day was years and years ago. I've since had two other dreams that took place in that setting.

--==- Dream 2 -==--

A few months after the previous dream, I had another. This second dream only lasted a few days (Short, in comparison to the other). I was closer to the age I am now (about 25ish), and Danny and I were planning to go for a weekend trip to another city. It was Tuesday, when the dream started, and we were getting everything ready for the trip. Dan came over to my apartment that day and greeted me with a big hug, which was our norm. He told me he was really excited for Thursday, because he was going to go out on a second date with a girl he really liked (I can't remember her name, but I do remember that she was blonde). We spent a few hours chatting, and Dan went home, and I went to bed. Wednesday was an ordinary Wednesday, but I spent a little time getting things packed for the trip. Thursday came, and I wished Danny well on the date, and expected to hear good things tomorrow (Friday). I remember hoping things went well also because I didn't want to have to cancel our trip if I had to pick up the pieces of things going south. Friday afternoon comes, and we're about to leave for the trip. Dan arrives at my place, and as he begins to tell me how things went the night before ... I

wake up.

--==--

It was less jarring than the previous time (I imagine because it only lasted a few days), but it still felt real. Not like one of my usual dreams. The most recent dream in this setting (A few months ago) lasted several months, and, interestingly, took place out of sequence.

--==-- Dream 3 --==--

I wake up at my parents' house, and am a little nervous, because it's move-in day for 9th graders. Everything's already packed, and it's time to go. I find my dorm, meet my roommate, and get everything settled in. Orientation classes, class schedules, maps of the building, rules, and everything that happens the first few days, as expected. None of this is skipped in the dream, but neither you nor I would get much benefit out of that description, lol. My first few weeks of classes go as would be expected. I made a few friends, who I shared almost all of my classes with, and who were decently smart. We'd help each other study, and remind each other of homework, and stuff like that. We weren't super close, but we talked to each other, and made fun of the other people who weren't in our clique. It was typical high-school stuff.

A few months later (still dreaming every waking moment. I even had dreams while I slept, in the dream), I was walking between classes on a Monday, and as I'm passing a side hallway, I saw a student on the ground with a bloody nose, and another kid about to punch him in the face. I run over and push the other kid off of him and stand between him and the student on the floor. I yell "What the hell is your problem!?" And he's about to respond by bloodying my nose, but a door opens and a teacher pops out. He starts running, but doesn't get far. We all go to the disciplinarian and tell the story. I'm sure you're expecting this, but I find out that his name is(n't) Dan (but that's what we're calling him here).

There's an absolutely no-violence policy at this school. I'm totally expecting him to get expelled. It turns out that his parents donate stupid amounts of money to the school every year, and somehow his discipline issues melted away.

The dream continues as usual. Wake up, get ready for class, eat breakfast, go to classes, eat lunch, more classes, study for exams, eat dinner, write essays, spend time with friends, go to bed. Weeks and weeks. In those weeks, Dan made it a particular point to make my life as miserable as he could. He would spread rumors about things I'd done - one of which almost got ME expelled, and nearly threw me into a nervous breakdown. On a totally normal Tuesday, about a month before the end of the school year I wake up. I haven't been back since.

--==-- Final Thoughts --==--

I'm not sure what happened between 9th and 10th grade that caused things to change so much. After the third dream, I realized that it was my 9th grade friends that turned on me for befriending Dan. It was they who Dan eventually had to defend me against, when they considered me a traitor.

Dan was an asshat, but something changed in him, somewhere along the line. After the third dream, I did a lot of thinking. I've determined that if Dream-Me could forgive him for being a completely unbearable person in whatever intervening time there was between dreams 3 and 1, then I could, too. Since then, Non-Dream-Me has a greater respect for Dream-Dan - knowing what he had to deal with, and how far he's come.

I still love him like a brother. Every month or so, my Fiancee will ask me how he's doing, and I'll respond "No more dreams, but I'm sure he's just fine". When he does come to mind, I wish him well. I miss him like I miss any other of my friends I've lost to one reason or another.

People might say that none of it was real, and I don't mind. Believe whatever you like. If even for just a moment (years and years), it was real for me. And for me, that's good enough.

Thanks for reading. :)

Edit: Minor edits for clarification.

[END OF POST]

*Q1: You said it didn't feel like a dream at all... do you feel like you had really been transported into another realm/reality? Were there current events? Like stuff happening in the news? Were they the same events as ours (gulf war, 911, etc)? What about celebrities and movies? Were they the same? Who was president? What about malls and brands? Commercials? Cars? iPhones (which version)?? (Sorry, just trying to pinpoint if it was a full * true * other-life, or if things were glossed over/excluded as they are in dreams.)*

Q2: I'm not sure what you mean about being "transported to another realm/reality."
As to the real-ness of it, in terms of life-feel, it was exactly as robust as this life experience. Sleeping, waking, eating food, showering, pooping: everything that a typical human life includes. There were real events that happened, but it was different. I'm not sure I had ever actually heard of 9/11 in the dream. Or even New York. There were radio celebrities. Technology was just different. There were no personal cell phones, or phones of any kind, and within the dream, I didn't expect that there should be. If we're comparing it to present consensus reality, I'm not sure the dreams I had fall along this timeline at all. Some things were more advanced, like the ability to convert matter to energy in a more reliable way than even fission, but there didn't seem to be the same push for the same kind of technology we have here. Radio and newspapers were the good stuff.
I'd be happy to answer a more specific question. :)

Q1: Okay, I'm kind of getting it now... that's very interesting :)
*What I meant by being transported to another reality is... well, when you woke you said it didn't feel like a dream, correct? So then was it like you had been * whisked * away? Planted into another you's body? Placed in another REAL life, existing dimension/reality somewhere? Like did you feel as if you had traveled or been transported to another life or place?? Or like, given the opportunity to live in another one of your timeline's and experience the other-you's life for a short period of time? As opposed to just sleeping and having a long complicated dream and waking up.. Hope that makes sense.. I'm trying to differentiate whether they were dreams or if you had really gone somewhere/been in another real life, somewhere.*

Q2: It felt real enough for me to miss my friend from that place, if that answers your question. I count it no less real than anything else I've experienced. As to whether that existence persists? I believe it does. From Dan's perspective, and Dream-Me's perspective (who have no knowledge of this-me), I'm sure everything's continuing as it had before, with no change. I don't think of the experience in terms of "Travel" or "Movement." It doesn't make sense for me to say that I "Went" anywhere, but you can think about it that way, if it helps. From my perspective, I had a lengthy experience in the intervening time of sleeping and waking, three times over the course of a year. We typically call sleep-time-experiences dreams, so that's what they are. It felt just as real as this reality, so I have no cause to believe it wasn't. Of course they were dreams: But why should that mean that I didn't also experience another real life? These are good questions. :)

Although there might be a sense in which everything is "continuing as it had before", it seems more like everything had already happened - because you dreamed them out of time order? (i.e. you dream-lived the 10th grade and then later dream-lived the 9th grade.)

It's as if you were exploring a pre-existing and already-complete memory block containing the experiences of another life. Which would mean that, in a way, the events don't really "happen" other than when they are being experienced by you.

Q2: I agree! And I feel that the same is actually the case with our own present lives. Happening-ness, it seems, requires a perspective. In a sense, we're all just pre-existing, already-complete memory-blocks which, from our individual perspectives, unfold one moment at a time. :)
I really enjoy this thought. Thank you for this!

It's a thought-provoking view and I think you're right about our "present" lives being interpreted this way. (It kind of changes the meaning of that word "present" though, doesn't it?)

So perhaps in this view, rather than the world being a "spatially-extended place unfolding in time", it becomes more like a "resource" - a toy box of all possible sensory experiences from which we can select the content of our lives. This means our lives are like a strand of thought, albeit a very bright, stable, and 3D-immersive one.

Copy-pasting a metaphor from elsewhere, in case you find it interesting:

The Hall of Records

Imagine that you are a conscious being exploring a Hall of Records for this world. You are connecting to a vast memory bank containing all the possible events, from all the possible perspectives, that might have happened in a world like this. Like navigating through an experiential library. Each "experience" is a 3D sensory moment, from the perspective of being-a-person, in a particular situation. And there may be any number of customers perusing the records. So this is not solipsism: Time being meaningless in

such a structure, we might say that "eventually" all records will be looked-through, and so there is always consciousness experiencing the other perspectives in a scene.

At the same time, this allows for a complex world-sharing model where influence is permitted, because "influencing events" simply means navigating from one 3D sensory record to another, in alignment with one's intention. This process of navigation could be called remembering. Practically, this would involve summoning part of a record in consciousness and having it auto-complete by association. This would be called recall. You can observe something like this "patterned unfolding" occurring in your direct conscious experience right now. You are not even the person you are experiencing, you are simply looking at this particular series of event-memories, from this particular perspective. "Dreaming" means to recall a memory that is not directly connected to this one.

Q2: Indeed! I have believed this way for quite some time. I find it rather freeing, actually. It kind of takes off some of the pressure, to know that this is just one segment of the entire reality, rather than the fullness of reality itself. :)

Nicely put!

POST: [THEORY] Two-fold glitch?

Rather than all these different copies of "you" swapping physical places with each other, why don't we just go with "everyone lives in/as their own copy of the world", and therefore glitches are simply shifts in the current "list of facts" of that copy. In this view, the world isn't a "place" so much as "world-pattern" or landscape, and your sensory experience of being "in" the world is an illusion, due to all your senses being implicitly formatted as "3D-spaces". Roaming around the world is actually you shifting your attention across this landscape, experiencing different "3D-sensory-slices" of what amounts to a heavily patterned "infinite gloop", rather than actually being a person walking around in an environment.

Summary - The world isn't a "spatially-extended place unfolding in time", it is more like a "resource" or toy box of possible experiential patterns, and we each have our own world assembled up from the same potential facts, just at different levels of contribution. We never truly go anywhere, and sometimes our "world-pattern" shifts from under us.

POST: I randomly skipped forward a year but I remember things from the "skipped" year.

Q1: Man, I'm 19 and my memories from 1st grade are VERY few and far between. And because memories are rewritten whenever we recall them, maybe that impression of "Wow, didn't this happen a week ago?" wasn't organic, didn't actually occur at the time. You seem to remember it strongly though so it could easily not be the case.

It does seem, though, as though he is recalling his reaction at the time, with follow-up questioning of his Dad, also at the time - like it was a stand out event then, rather than something reasoned out subsequently and completely "story-fied" due to repetition. It sounds a little bit like a fugue state - that he 'zoned out' or dissociated shortly after the first Super Bowl viewing, then was triggered out of it by the second Super Bowl. So he still has the memories of that year, because physically he did live it - but not as that particular personality.

POST: 11:11

This guy went pretty far down the 11:11 rabbit hole [POST: 11:11 -the numbers in my life for over 25 years]. The more you focus on it, the more it'll seem to show up in your life.

This applies to any pattern though, there's nothing particularly special or meaningful about "11:11", except that these things seem to be self-reinforcing. This also works for more complex ideas than just number patterns - including associations between numbers and types of events, or even larger ideas about how the world works. Whatever your theory of the day is, if you stick with it, you'll start finding evidence for it. You can experiment with this deliberately and get 'interesting' results. A clinical psychologist called Kirby Surprise (appropriate name!) wrote a book called Synchronicity which tried to provide a way of thinking about these sorts of occurrences, and included specific examples of people getting lost in the patterns, only to realise they were indirectly doing it to themselves. Worth checking out. This radio interview pretty much covers it all, to save your reading the book.

Q1: This is really interesting, i guess since i associate 11:11 to big things maybe thats why it happens. The thing that freaked me out the most though was that last night it happened AT Discovery channel, i mean, i was not looking at the clock, it was at the TV, like, a show was going on and then it went black screen with 11:11 big on it. I thought (still think) that is some kind of show they are about to do but i havent heard anything about it.

That's a pretty good one!

Definitely check out that Kirby Surprise interview if you haven't already. Although it sounds like an esoteric topic, he's actually a straightforward guy who had noticed his patients getting obsessed with synchronicity (interpreting them as "messages", which is the worst thing you can do), and had them experiment with it to help them get out of the feedback loops that can arise. If you start paying attention, you really start to notice this sort of patterning in your everyday life. And you also begin to recognise the outlandishness of some of your everyday encounters (I find). It's like you are living as an imagination room within which you can create some owls (if you want to be playful about it).

POST: [THEORY] Theory of Convergence

Why do the universes need to be "running"?

Could you not instead have a static set of patterns, and it is you experiencing them that "runs" the content, which "happens" the happening, so to speak? Universes then become different states rather than different places - different distributions or sets of contributions of potential "facts".

Q1: 'Running' as it time passing at a uniform rate in both universes. I kinda see what you're getting at, but the universe I believe is dynamic, rather than static. Any event can change everything, and can either cause a divergence, or, as I suspect, a convergence.

Given that we never actually experience a divergence or a convergence - we only experience changes within our own perceptual space - is it not simpler to envisage this as a set of possible states which we attach to or unfold within ourselves? Like the configuration space described in Julian Barbour's The End of Time combined with David Bohm's implicate and explicate orders - or an Infinite Grid of All Possible Moments. Basically, I'm questioning the assumption that the world is of the same format as our experience; suggesting that spatial extent and temporal change are artefacts of experience itself. So, experiencing is dynamic, meaning that the universe doesn't have to be; it just has to contain all possible (coherent) states.

Q1: Hmm, interesting, a little beyond where I was going, but interesting. What is your take on parallel universes and the like, in relation to what you say above? That what we might think are parallel universes and weird events are more glitches in personal perception?

Or "changes in state", perhaps.

(I'm not sure I'd call it personal perception as such, maybe subjective though. Although once you've done that, the notion of "subjective" changes, I'd say.)

I think our confusion about "glitches" and our resorting to things like "many-worlds" - nonscientific but with the feel of "scienceiness" - arises from confusing our thoughts about things, our abstractions, with their actual nature. So long as we realise they are metaphors, then that's not a problem, but we do tend to treat them as literally true. You will never see a parallel universe. You will never even see yourself, in fact. If, in glitches, we are talking about something which appears to be a fundamental shift, then it makes sense to return to the fundamentals of our experience in order to examine it, rather than stop at a sort of halfway point. (The halfway point being: to continue to view the world to be as it appears in sensory experience, and building out from there, rather than digging into the nature of that experiencing.)

Returning to experience, then what we call "a parallel universe" is really a discontinuity of experience which we explain to ourselves using the fiction or metaphor of "parallel universes". Parallel universe are the abstract description, not the reality. So, taking experience as our starting point, we might end up with the following "scale of explanation", in terms of how it seems to us based on the level of discontinuity:

- conf. bias => coincidence => synchronicity => "manifestation" => world shifting => "jumping universes"

Q2: I am saving this, you are fucking brilliant but don't let me give you a big head. I try so damn hard to get this concept out in different ways all the time. The words coming out of my mouth are not the ideas I try to convey, I am speaking metaphors about my understanding. That is what words and communications are, metaphors of comprehension s.

Glad you find it useful! As you are noticing, problem is that the true situation is literally unthinkable - because our thoughts themselves arise as 'space and time' experiences, whilst the fundamental situation is "before" division and change. Where is space and time before we "run" an experience of space and time? But if we take a step back and keep things abstract, knowing that we are using metaphors, then we can make something workable that isn't misleading.

Q1: We all gotsta understand that words are relative to the actual ideas we wish to convey folks

Well, I meant more that: it ain't even an idea. (The point wasn't intended to be the patronising, obvious one.)

Look at it two ways. There's either a collective overworked interpretation of data and experience... or the world is a magical place where weird shit happens.

Or why not look at it both those ways at once? :-)

We are not so far apart as you might imagine. It's all about where we think the "magic" is. Usually in our descriptions we are inclined to place the magic at certain levels of the content of experience. I suggest that the magic is actually the foundational level - and by recognising its place there then we get all the benefits!

All the metaphors people use are different attempts to describe the relationship between the objective and the subjective. Hence the computer or simulation metaphor's "data + processor", and all the other versions of "landscape + doer". This tends to make one aspect alive and the rest not; the generalised version is "dead + alive". But the proper approach is one which recognises there is no division, that the doer takes on the shape of the landscape. For example:

The Blanket Metaphor

Imagine that there is blanket of material. The only property of this blanket is "awareness". When flat, the experience of this blanket is "existence". Now, the blanket shape-shifts itself into a pattern of folds. The experience of the blanket is now the experience of itself "being-this-shape". The blanket may even come to identify itself with some of those folds and not others, perhaps because they change more slowly than the rest and seem consistent, calling them "me". So we have that the content of experience is the folds in the blanket (this includes the "formatting" of experience: spatial extent, sensory streams, and so on), but the nature of experience is the blanket itself. The set of folds can be described by metaphors (patterns, states and so on), however the blanket or the property of "awareness" cannot, since it is fundamental.

This is why structural metaphorical descriptions seem so "dead" even though they are the most flexible and nearer to the truth: our notion of "aliveness" is associated with complex content, movement basically. In fact, however, the "magic" is baked in at ground level, which is why even the background quiet of a peaceful moment is filled with "aliveness". It is "awareness" that breathes fire into the patterns of potential experience which are dissolved within it.

You should run this idea through some of the physics subreddits and see where they can take it.

Well, the point is that this is before scientific observation: it is philosophy and metaphysics. As indeed the many-worlds interpretation is. There's nothing scientific about it - but that's not a dismissal, it just means it's not intersubjectively verifiable as a model. You can do things to explore it subjectively, however. Which is where...

(Yeah, it's great that story, isn't it?)

...it can indeed explain that story, but you have to go to the full patterning model to do it. I'm pushed for time right now, but here's a limited description: The Patterning of Experience. The most important notion is to recognise that the world is not a "spatially-extended place unfolding in time" and is more like a toy box of potential experiential patterns "dissolved" into the background. In other words, the full picture is a little more subtle than the convenient "moment" divisions that the Infinite Grid metaphor outlines, and more like a complete set of patterns or "facts" or "formatting", with different levels of contribution.

Okay - can pick this up later if you like, I've enjoyed the discussion.

POST: The town that wasn't ever really a town turns off.

[POST]

First time poster here so I do apologize if anything is out of order. When I was about 8 years old my Mom and I moved from Colorado to North Carolina. We didn't have much money at the time so we packed up everything that we could fit into her 1990 Pontiac Sunbird convertible (even our massively overweight cat was among the tetris packed tiny car) If I remember correctly we had planned on the trip to take about 2-3 days including hotel stays because my Mom had a couple of bad experiences with crashing out at rest stops in her car but that's not a story for this sub.

Everything went fine for the first day/night. Day two began completely normal, we ate our breakfast and got back onto the road. We had been driving for about 6-7 hours (this is based on my Moms memory) and decided that we would start to look for an exit to grab a bite to eat and find another hotel/motel (no money for a holiday inn) and took the first exit that we saw. (I know that my Mom is still freaked out that the exit number was seemingly instantly deleted from her memory) We drove down this exit for what seemed like an eternity and even at my young age I thought it was weird that we hadn't seen any other cars or even any streetlights for a few minutes. And then like somebody fucking just flipped on a switch THERE WAS AN ENTIRE TOWN ABSOLUTELY COVERED WITH WHITE CHRISTMAS LIGHTS ON EVERY FUCKING INCH OF EVERY BUILDING!

This was in the middle of Summer when we were making our move 2. The lights seemed to just turn on as soon as we entered the "town", it was pitch black before and the only light was from my Moms headlights. We didn't come around a curve or over a hill, we just kind of popped up right in front of it.3. There WAS NOT a single person walking around, no cars parked on the streets, no lights on in any of the buildings (besides the millions of Christmas lights everywhere) At first my Mom thought this place looked cool and drove around the tiny(ish) town looking for a hotel. After about 10 solid minutes she said that it looked like everything was shut down for the night and we should go find another exit to take and get to sleep.

So we begin going back the way we came, we pass all of the empty but mega bright buildings and drive down the deserted road back to the highway. I was looking behind/to the left of me watching this strange place fade out of sight and then IT HAPPENED AGAIN!!! LIKE SOMEONE JUST TURNED THE SWITCH TO THIS ENTIRE TOWN OFF. It was gone, just blackness. I told my Mom that it turned off and she said it was probably just behind a hill or a mountain or whatever. But I know I saw this place instantly vanish, right in front of me. We get back on the Highway and find another exit with a hotel and what not. We go to this shabby little gas station and I got a few snacks and a drink while my Mom talked to the cashier. We went to our hotel and a day later arrived In North Carolina. (that place is hell don't go there.)

I hadn't even thought about that event in years (I'm 25 now) until I began reading this sub. Now let's rewind to about an hour ago. The memory of the creepy town of lights hit me like a ton of bricks. I messaged my Mom on FB about it and she had only this to say. "I didn't want to tell you what that cashier said to me at that store. I had asked her about the weird place with all of the Christmas lights a couple of miles down the road and she gave me a really strange look." What my mom said next was when I knew that this shit was real. She said the cashier told her that in the late 70's there was an attraction town for the Christmas holiday, it was pretty much supposed to be like santas workshop I guess. But the thing is that they tore it down and moved it completely across state (this was in Tennessee by the way) So we went back in time? But even so why weren't there people/cars? Did we see the ghost of something happy? I never had a bad feeling or felt like it was a place we sholdn't be but.....WTF was that? Hope this all made sense. And again,sorry if this was out of place or had mistakes. EDIT-Corrected the huge chunk of text to paragraphs (sorry about that) and spelling.

[END OF POST]

Q1: This sounds like that particular type of glitch that I like to call the "no_players_map". Other people have reported a similar scenario, with many variants, where the common thing seems to be that the ones who experience it temporarily stray in a location, whether previously known or unknown, where there is absolutely no one at all. If reality is a simulation, whoever runs it seems to be testing out new maps and props without "players on the server" first... except that some players do manage to stray in one of the maps accidentally from time to time.

Maps can be flexible, perhaps, in a useful way. Here's a story from the realityshifters.com story section:

A Miraculous Journey

Jo - Bournemouth, Dorset, UK

Some years ago, when I used to do onsite massage work in the corporate world, I remember that on one particular occasion, I had a very remarkable journey. That day, I had a contract to work in a large office in Docklands, London. At the time, I lived in Loughton, Essex. As I got ready to leave my flat that morning, I got out my large A to Z map so I could plan the route. I was fairly relaxed about this, since I thought to myself, “OK, this contract is in Walthamstow, and I know that well enough, so finding this place should be easy”.

Well, of course, I got the location wrong! On checking the venue’s address, I panicked as I realised it was a further distance away than I thought, and in a very unfamiliar area for me. I wondered how on earth I could arrive there on time. I was suddenly stressed and embarrassed at the thought of letting down the other massage team members as well as the event’s organiser. I also knew that if I didn’t show up, I’d never get another contract with this group again. Somehow I had to get there on time! There was no time to call a taxi or even plan the route.

So I made a decision, crazy though it sounds, to just surrender, let go and hand over to ‘Spirit’. I trusted that a higher wisdom already knew the way to this place and was perfectly capable of taking me there. I got in my car, and without even looking at the map, I prayed to be taken to the car park right by the offices I was to work in that day. I asked to be taken there safely and with enough time to spare so I could set up my massage table and get myself ready to see the full schedule of clients that had already been booked in to see me for the day. I remember driving off in the right direction and then praying with such an intensity and sense of trust. I handed over. I drove. I went down streets and found myself in areas I’d never been in before.

One road in particular had a very strange quality about it. It was narrow, very long, eerily quiet and strangely devoid of other cars! I just kept driving and praying. After a while, I had a feeling sense that my journey was coming to an end. Then I somehow ‘knew’ I had to stop very soon, since I was close to my destination. I looked around for a place to park.

The area was very busy with cars, but as I approached a roundabout, I noticed there was a petrol station just by it. I decided to stop there, just to discover where I was! I pulled over and parked. I went into the shop. I asked a man by the counter if he knew where the venue was, showing him my paper with the address written on it. He said, “it’s over there”, as he pointed to a large building just the other side of the roundabout. It was easily visible from where I was standing. He told me I could also park there, right outside the building in the large car park provided for employees there.

I was astonished, but I don’t think I let it show. I thanked him and quickly got back into the car. I knew I had to keep focused as my journey wasn’t over yet. As I pulled into the car park and parked in a slot just a few feet away from the entrance, I noticed I was 20 minutes early! I went into reception, and had my visitor pass organised. I got to the event room and set up my table. I had time to get ready and then began work.

The day went very well. When it was time to go home, I had a long journey back. I was often stuck in traffic and it all seemed like a busy, noisy and normal journey across London- very different to the 'other worldly' one that I had had that morning.

To this day, I still have questions in my mind about how it was even possible. The times didn’t fit- I should have been late. The odd street I went down- I don’t think it was in ‘this world’. And I can’t prove a thing and I’m careful who I tell this story to. But for me, it’s an example of how anything is possible with Spirit, if I can just get myself out of the way. My miraculous journey was dream like but it was a specific event with many other people involved and not a dream (as I understand it!) The most amazing thing for me is that I got there at all and without a map or sat nav. Normally, I have no sense of direction whatsoever.

Q1: Interesting story. However, there is an element of intention here, the deliberate decision to 'hand over' and the request to be 'taken there'; this element makes me think that this beautiful story has more to do with the so called 'Law of Attraction', rather than a 'reality malfunction'. The coincidence of this happening when it was requested gives it away.

For sure, this seemed like a knowing intentional shift - but I'm not sure that OP's tale is necessarily of a different type fundamentally. Intention needn't be (and seems not to be) an "effortful" thing; perhaps the monotonous rhythm of the car lulled them into a hypnotic state, making it easier for a passing thought pattern to become triggered into a full experience (for example).

Q1: Sure. I don't forget that we are dealing with theories on something the reality of which still baffles us completely, so... one theory is as good as another. So far, it is really just a matter of personal preference on this or that theory.

Of course. This is philosophy, not science, and that's how it'll stay. All "explanations" here have an implicit "isn't it fun or useful to think of it this way..." in front of them. Although some theories maybe cover more ground than others, are more coherent or whatever.

POST: [THEORY] The Christian explanation. Time anomalies. Supernatural realm stuff

I dunno - if you want to go along that path, I think other traditions do it better, compared with what most people would see as the Christian view (apart from the Gnostics perhaps). For example, the Christian view as described in that article, mocks "pseudo-explanations" (fine) but then still holds onto the notion of "demonic entities" as real (less fine). The article even brings up sleep paralysis as evidence of them, which is rather circular. Basically, it begs the question: it assumes the Christian view as fact, and from that position dismisses the other views as fantasy, despite its own view appearing as fantasy from the opposing platform.

The solution perhaps? All of it is fantasy.

The Story of Narada

Amongst Brahma’s many sons was one Narada. Narada refused to marry. He did not want anything to do with the material world. Like Suka, he preferred the realm of Narayana, when time and space do not exist, where Maya casts no spells. He went a step further; he encouraged Brahma’s other sons to stay celibate like him. He did not see the point of engaging with Prakriti. He did not understand the point of constructing Brahmanda.

Many of Brahma’s sons agreed with Narada. They also refused to marry. This happened several times, until an enraged Brahma cursed Narada, ‘you will stay trapped in the material world until you appreciate the value of Maya.’

Narada went to Vishnu and asked him the meaning of Maya. In response, Vishnu said, ‘i will explain after you quench my thirst. Go fetch me some water.’

Narada went to a river to fetch water. But as he was collecting the water, he saw a beautiful girl. He was so drawn to her that he followed her to her village and asked her father for her hand in marriage. The father agreed and the two got married. Before long, Narada was a father and then grandfather and then great grandfather. Narada felt content. Suddenly one day, it rained. And the rains refused to stop. The river swelled and broke its banks. Water rushed into Narada’s house, and to his horror, swept away his wife, his children, his grandchildren and his great grandchildren. He screamed and shouted for help as the water dragged him under. Suddenly he was pulled up and found himself in Vaikuntha (Vishnu’s abode) before Vishnu.

‘Narada,’ said Vishnu, ‘where is my water? I am still thirsty.’ Narada did not understand. Where was his family, his wife’s village, the river?

‘Where does this pain and suffering come from, Narada?’ asked Vishnu with a smile. ‘I thought you had full knowledge of Maya before you set out to fetch water for me.’

Narada bowed his head in realization. He knew Maya but had never experienced Maya. Brahma was encouraging his sons to marry so that they experience Maya. Knowledge of Maya is not experience of Maya. Unless one experiences Maya, one will not be able to empathize with those who are trapped in it.

Said Vishnu, ‘you knew all about measuring scales and subjective realities. Yet you forgot all about them as soon as you experienced the material world – home, family, children, and village. Your understanding of Maya and Brahmanda could have helped you in the tumult of pleasure and pain, but it did not. Such is the spell of Maya. Now that you have experienced Maya, i want you to go and meet people, shake up their measuring scales, challenge their subjective realities, until they realize that the only way out of Maya is seeking answers out of material reality. I want you to provoke them into following the spiritual path.’

...is to say that there is no reality?

No, not to say "no reality", it just means that the true nature of reality (of "experiencing" really) is not its specific content, but rather the awareness of which it is formed - like folds in a blanket of pure consciousness (which you might call "God", unless you are bound to the notion of an "entity god"). The demonic explanation is not okay (by which I mean unreal and non-explanatory), because "demons" are of the same form as all the other pseudo-explanations listed. The Christian explanation provided there, is a content fiction in exactly the same way as the others it's arguing against (which actually it doesn't really argue against). It's just that you are more comfortable or accepting of the "reality" of those ideas. But they're just ideas. It's all Maya.

Note: I actually think that article is a misrepresentation of the Christian interpretation of reality.

POST: My Boyfriend is Now Left Handed

Hmm...

I think you are probably misrepresenting both atheism and science here?

science has never proven that a Creator doesn't exist.

Science doesn't prove anything and is not intended to - is catalogues observations and creates conceptual frameworks with descriptive and predictive power. Science examines the content of experience, it does not examine the nature of experience. You argument that it "has never proven that a Creator doesn't exist" is meaningless in those terms, but also because one can't prove something doesn't exist, only that it is logically inconsistent with what has been observed thus far.

"... cannot hear the music of the spheres." -Albert Einstein

Many physicists in history (lots of those early 20th century guys) have studied what you might call "mystical traditions" - but the God they refer to is not the "entity god" that common non-philosophical interpretations of religion tend to, but something more like "raw existence", whose properties are the "oms" (omnipotent, omniscient, omnipresent) but not in an anthropomorphic way. As this does not refer to a deity, it can be compatible with atheism, since really it's just a recognition that "consciousness exists".

a Creator doesn't exist

If you pursue this line of reasoning, it leads to the conclusion that a creator as such does not exist, since nothing can be created - only creation exists. Consciousness would be "before" division and multiplicity and time and so could never create anything.

Both sides allegedly have no proof then why not err on the side of caution then?

That means I could raise any unfalsifiable claim where the penalty in not believing it was unpleasant - and you'd have to go along with it "just in case". It's really not a good line of reasoning to follow. You'll be spending your days with paper plates on your head in case the spaghetti monster rains down his pasta apocalypse - etc. ;-)

Meanwhile, the Mandela Effect doesn't prove multiple worlds/timelines - it can equally be used as evidence for, say, the philosophy of subjective idealism and that idea that patterns of the mind are unstable. You have to separate out the experience from the potential descriptions for that experience. Since we can't test our descriptions, basically it's a narrative fiction we're engaging in - there is no provable truth of the matter.

This is what is referred to as "scientific proof."

We have to be a little careful here. For instance, there is no such thing as a photon really as such - it's an abstraction. Scientific proof doesn't not prove the existence of anything; rather it is a confirmation of the self-consistency of a description. Beware the reification of abstractions, and all that. Science could never prove there is a creator or disprove it - it can certainly disprove a hypothesis by making an observation whose content is inconsistent with that hypothesis. If a falsifiable hypothesis is not made - i.e. a prediction is made that can be confirmed or not - then science can say nothing about it. Science doesn't deal in truth.

And about the mandela effect. Your point would only be valid on an individual basis. When thousands of people are reporting the same accounts, it is clear that it is much more than "subjective idealism."

Well, subjective idealism asserts that all experience is in mind and that there is only one mind, so there would be no "thousands of people". Actually, it would be the ideal explanation for Mandela Effects, if you're willing to give up the notion of an external objective universe and take a "private view" of reality - which even some recent interpretations of quantum physics are doing these days, actually. How exactly does the Mandela Effect suggest that timelines (which are really just diagrams we use for conceptual thinking, after all; they have never been real things) exist, or that God exists?

From what I gather you are basically making some sort of philosophical argument.

Well, physics is basically: observations + philosophy.

It's "course-corrected philosophy" and optimisation of abstractions. And it's important to remember which way round things are: observations are primary, connective fictions are secondary. The reason I bring it up, which does sound nitpicking but really is not, is that when we are talking of things like "timelines" or "many-worlds", we are talking only about the philosophical aspect because the observational aspect cannot distinguish between the interpretations. "Many-worlds", of instance, is inherently non-scientific. And neither is the (better, in my view) suggestion that world is not formatted in the same way as our spatial sensory experience, and we might put together an attentional or pattern-selection description of the unusual experiences instead.

Clearly there is not "one mind" as all the accounts would line up to reflect one mind.

You have a dream one night - it's a dream about a board meeting, where you are going to decide once and for all what the definitive map of the world should be. However, each of the dream characters at the meeting offers a different suggestion for the relative locations of continents, backing it up with stories of their experiences. But wait... surely they are all in one mind - yours? How can they report different experiences?

Anyway, let's not get too off topic!

Coming back to my questions (which are to seed discussion, they are not a challenge):

- How exactly does the Mandela Effect suggest that timelines exist?
- How exactly does the Mandela Effect suggest that God exists?

Science and Philosophy

Physics is not observations + philosophy.

I think it's a pretty snappy summary, myself! Oh well. I'm with George Ellis and N David Mermin on this stuff, mostly. As I'm sure you know, Schrodinger's thought experiment was intended to demonstrate the ridiculousness of the Copenhagen interpretation. Quantum mechanics is a mathematical theory - literally, given a defined situation it gives you a list of potential outcomes along with an "intensity" for each (which some interpret as a "probability"). When you make the measurement, one of those outcomes will be observed. Everything else (including "wave function collapse") is interpretation. Which is fine - - - but if there is no way to distinguish between the various interpretations by observation, then we are in the realm of pure philosophy, not science. That doesn't mean it's not valuable or useful - it doesn't devalue it at all - it's just being clear about the type of knowledge and investigation we are dealing with.

Dream Analogy

The dream analogy you used is not applicable. We are not talking about dreams. I've also had the capability to fly in a dream and fought off a monster with 10 heads, how is that applicable to reality?

The applicability is that you are assuming that because you have experiences of other people reporting similar or dissimilar experiences to you, that this means that they cannot all be arising in one mind, as per the view in subjective idealism. I'm not pushing the point really - just indicating that "seeing people say different things" doesn't contradict this. Flying or monsters in dreams is neither here nor there - I've had plenty of dreams which correspond to his mundane experience now. In terms of the nature of experience, waking and dreaming are indistinguishable. They differ only in their content (although often not really) and that we have experienced "waking up" and apparently have memories. I mean, it is undeniable at this moment that your entire experience is arising within your mind, right? And that you have no access to anything outside of your mind, yes?

Mandela Effect Theorising

A better question to your question would be how does the mandela effect suggest that different timelines DO NOT exist.

It's not a better question at all! I could simply retort: "how does the Mandela Effect suggest that subjective idealism is not the true nature of your experience?"

If we start with the actual observation, what do we have?

1. One day you had an experience (say, encountering a Wiki article about real animals called narwhals) which contradicted a specific memory of the world (reading a book about mythical creatures called narwhals).
2. Subsequently, searching for physical evidence to support your prior memory, you can find only thing which support narwhals as being real, and none which support the mythical status.
3. In conversation in person and online, although most people say they knew about narwhals being real, a substantial number of people also say that they thought narwhals were mythical, and are surprised to discover they are real animals.

From here, you are suggesting that what happened is you moved somehow from a "dimension" where narwhals were fictional, to a dimension where narwhals are real.

So we have some questions:

- What further evidence supports the dimension-jumping hypothesis? Did you actually experience this happening?
- Have you ever seen a timeline or a dimension? Or is all of your evidence of the form: "certain of my memories and the world do not correspond anymore"?
- What exactly would be the transfer mechanism? Are physical bodies moving between places? What form does a "dimension" take?

Note - I am actually sympathetic to idea of the "effect" and so on; I am just seeking a full exploration and justification for a particular view. I'm not convinced that timelines are the best approach.

The Blink of an Eye

So unless all of that was created with a blink of an eye...

Well, there's the thing. That is only a problem because you are viewing the world (or "dimensions") as persistent places - seeing the world as a "spatially-extended place unfolding in time". This is not necessarily the case. What you actually experience, is observation then observation then observation, always in the present moment. Even if you have an observation "about" the past, such as finding an old book about narwhal expeditions, it occurs in The Now. The only reason the world seems to be a persistent "place" is because, generally, our observations tend to arise consistently with previous observations - the implied facts of what we have seen before, seem to form the foundations of subsequent experience. However, this is not necessarily a hard rule. The world is not necessarily "happening" outside of our observations; only observations "happen". (This is one of the possible interpretations of the Delayed Choice Experiment: a reminder that our story of what happens between observations, doesn't actually happen, it is a connective fiction.)

So this leads us to the possibility of the Mandela Effect being a result of a state change, a shift from one coherent self-consistent state to another, with all subsequent observations being in alignment with the resulting state, except for personal memory. You don't go anywhere; it is actually the patterning of your own mind that shifts.

POST: [Question] A question about Quantum Immortality

Q1: Quantum immortality is what happens when you combine someone who fails their second year of undergrad physics but got through enough to completely misunderstand quantum mechanics. It's fine if people believe in something like quantum immortality, but please stop acting like it's based on science. It's as scientifically founded as religion is.

Q2: The way you wrote that, it suggests that quantum immortality is obviously impossible to anyone who passed a second year of undergrad physics. Can you explain why? I have a lot more physics background than that, and it still seems reasonable to me- it is an obvious consequence of the Many Worlds Interpretation. It hasn't been proven, but that hardly makes it unique among modern physics concepts. MWI makes a lot of physicists uncomfortable but it's hardly pseudoscience- it is seriously researched by some really good physicists- Max Tegmark, Julian Barbour, etc.

I think it's probably better to treat that stuff as philosophy. That's really what MWI is (along with all the other interpretations). Doing that avoids this whole science/pseudoscience debate, and the tendencies of pop-science magazine enthusiasts who love "scienciness" rather than science - i.e. people who conflate science itself (cataloguing repeatable observations and creating conceptual frameworks to link them), and concepts which are used in science at present. It's part of that larger thing of separating the experience from the explanation, and remembering that our explanations are really connective fictions built from useful abstractions, rather than "how it really is". That way, we are free to tackle everything (including the nature of experiencing itself), rather than being hobbled by treating some concepts as "actual" whilst others as fictional.

Q2: Calling it philosophy ignores the importance of this type of thinking as the core process that advances physics itself. Nearly every major physics discovery started as an abstract philosophical idea, and only after it was developed more did people think of experiments and applications. For example, relativity wasn't an attempt to explain repeatable observations but philosophizing about "how the universe should work." Einstein thought it was a reasonable idea even though at the time it seemed to contradict some experimental observations that later proved wrong. Eliezer Yudkowsky's essay "Science Doesn't Trust Your Rationality" talks about this- that people that don't follow the rules of "how science is supposed to work" are often the ones that are responsible for the biggest advancements:
[http://lesswrong.com/lw/qb/science_doesnt_trust_your_rationality/ and http://lesswrong.com/lw/qj/einsteins_speed/]

Calling it philosophy doesn't ignore any importance at all. It is not meant as a derogatory term - it simply differentiates between ideas which are observationally distinguishable using the "objective world" concept, versus those which are not. I'd actually say that physics is philosophy, with an integrated observational component. What varies is the number of "observational touch-points" that a given conceptual framework incorporates. We are probably seeking the same end, from different directions - i.e. the freeing of thinking from pre-judgement due to categorisation. I'd definitely concur with the idea that science does not in fact work according to "how science works"; possibly to the extent that, really, there is no such thing as "science" as commonly depicted; that's mostly PR and retconning. Broadly, I'm with Paul Feyerabend's angle on this. There's an ongoing swirl of "contrary gloop" and "coherent solidification" and how you think science works depends on which era you happen to be living through.

Q2: I had never heard of Feyerabend, but his work looks fascinating. Could you recommend something of his to read that talks about what you are getting at?

Yeah, he was fascinating guy in terms of work and as a personality, I think. You'll probably find yourself agreeing, disagreeing, re-agreeing again, and so on as you read him, which is the point I think: he targets things that, if one thinks them, one should be sure one really thinks them.

So, his book Against Method is the main thrust of it, and the final edition of that is the one to check out - every edition was like a new book really - with Farewell to Reason's collected essays and subsequent works expanding his ideas into other areas. With Against Method he was being quite deliberately provocative. You can get a feel for the style by reading this introduction to the fourth edition by Ian Hacking [<http://thehangedman.com/teaching-files/hps/hacking-feyerabend.pdf>]. Basically: Feyerabend's overall conclusion is that we should avoid there being one accepted vision of the world. Unfortunately, Feyerabend died before he could bring it all together in his final book, Conquest of Abundance, so it was released as a half-book draft plus a selection of essays. It's still got good stuff, and it can be an easier read than his previous works, so actually perhaps a good way to start. Ian Hacking did a review for London Review of Books, which is unfortunately only partly available free online.

But anyway - even if it doesn't look your kind of thing, he was a very interesting character, and his autobiography, Killing Time, is a good read while also giving a bare bones indication of his philosophy, if that's all you're after.

BTW, based on your posts I think you would really like the fiction book Anathem by Neal Stephenson. It's about a group of scientists that are more or less ostracized from society for dimensional jumping.

I've read some of Stephenson's earlier stuff, up to Cryptonomicon, but I never caught up with Anathem - thanks for the tip! EDIT: Just looked it up, interesting that it's based on Julian Barbour, configuration spaces, etc.

I was reading it and Barbour's "The End of Time" at the same time because different people had recommended them, without realizing they were related at first- It was quite strange.

Ah, nice, it's fun when these things match up. When I read The End of Time I was flipping between that and David Bohm's Wholeness and the Implicate Order, which made for a nice mix. (Recommended if you haven't read it.)

POST: Things happening out of order. Retrocausality glitch?

People with Temporal Lobe Epilepsy often experience time-distortion type effects, in terms of time speeding and slowing, and also "out of time" type experiences (see this book chapter for background). Has there been any history of epilepsy in your family, or have you had any other sort of seizure or zone-out before?

Which wouldn't necessarily explain the content (particularly, that your eventual internal history matches the facts even though it doesn't match other accounts), but it's a possible link to explore.

Do you really think it's more likely that the universe glitches out than that a few people misremembered things?

I don't know how you'd work out "likeliness" either way, really. You'd have to construct a model of "likeliness", including a definition of what a "universe glitch" is. Of course, it can not be memory thing and also not be "universe glitches". After all, we could "explain" any experience at all with "brains are prone to error" and "memory is faulty" and go no further. We can especially do this if we ignore the details of the post and don't engage with them. Isn't the interesting thing to explain how exactly an explanation applies to the story? Otherwise it's not really an explanation at all - at best, it's a categorisation. If we just say "brains" or "memory" and nothing else, we're really saying just nothing, since we don't know how either of those things work. Not even just not in detail - we really don't know what memories "are", we've just got some crap computer processing metaphors that we paste on top of some shoddy brain blood flow mapping.

Having said all that, OP didn't seem to be actually trying to convince anyone (even himself) that the universe had glitched - just that he'd had a curious experience and was interested in discussing it. Rather than, say, being dismissed in a fairly content-free manner that didn't make any effort to connect with the account.

No history of seizures or epilepsy in myself or my family. I'm a busy software engineer by day and a really busy father of an energetic toddler by night - any seizures or zoning out would be promptly noticed by those around me (and would be no excuse for shirking my responsibilities).

All the more interesting, then.

POST: debit card expiration date changed

And what about the children? ;-)

Of course it can be not poor memory and also not universes splitting or time travel (or whatever - people drop that those references for a bit of fun I think). It seems unlikely that OP's experience is best described by "poor memory". How, exactly, would that work? It's a bit of a non-explanation. It'd be interesting if someone came up with a nice model, though, which described a mechanism whereby a memory-shift updated our "world image" in a self-consistent way. OP should have a look for some old receipts though, as you suggest, maybe look at the dates of their previous card, in case there is some trail that would explain it. I'd go with the "wife put new card in wallet" description, but you usually get more than a one-year extension when you get a new card.

Yep, I'm aware!

The problem is the lack of a model with a mechanism for networked memories - and that, as with confirmation bias, false memory tends to get name-checked as an explanation for things which fall outside of its narrow applicability. Which isn't to say that many glitches aren't memory related, just that we don't have a decent description to get there. Our real issue is, we lack an understanding of memory (even what memories are, never mind where they are) beyond some fairly hand-waving metaphors invoking computing analogies, which don't really stack up. (All part of the fun, though.)

Interconnected with an underlying fact - implicit or explicit - rather than simply the memory of an event, or an abstract notion of a fact. So - and this isn't the best example but let's go with it - if you'd spent five years typing the same ID number on a weekly basis, then you have both the memory of the act, bound to the fact. Your memory isn't of the fact in the abstract, or of a single particular event. When one day the number is apparently different, it's not as if you have been reviewing the previous occasions in your mind, or contemplating the fact independently - you have performed an act and the implied fact is no longer supported. You experience a dissonance, and then recall instances of the old fact as experiential content. It doesn't fit the revision-of-memory model - or imaginative creation model - of false memories. (We could probably come up with some sort of "world schema" model that would fit, but I can't see how it could be tested in any meaningful way, so it'd be yet another bit of handwaving psychology to add to the stack.)

Of course, it truth it's kinda pointless and unscientific, this process of trying to account for apparent glitches of this sort, since there's no way to observe the situation. Although we might say something is "more likely" (we'd need have a model of "likeliness" to do that) or "more plausible" (corresponds to our everyday experience, which doesn't necessarily mean much), really it's pretty much just some philosophical fun.

POST: Found out where all of our missing objects are going

The source paper is Teleportation Physics Study by Eric W Davis, and the quotes come from page 56. The report abstract states:

ABSTRACT

This study was tasked with the purpose of collecting information describing the teleportation of material objects, providing a description of teleportation as it occurs in physics, its theoretical and experimental status, and a projection of potential applications. The study also consisted of a search for teleportation phenomena occurring naturally or under laboratory conditions that can be assembled into a model describing the conditions required to accomplish the transfer of objects. This included a review and documentation of quantum teleportation, its theoretical basis, technological development, and its potential applications. The characteristics of teleportation were defined and physical theories were evaluated in terms of their ability to completely describe the phenomena. Contemporary physics, as well as theories that presently challenge the current physics paradigm were investigated. The author identified and proposed two unique physics models for teleportation that are based on the manipulation of either the general relativistic spacetime metric or the spacetime vacuum electromagnetic (zero-point fluctuations) parameters. Naturally occurring anomalous teleportation phenomena that were previously studied by the United States and foreign governments were also documented in the study and are reviewed in the report. The author proposes an

additional model for teleportation that is based on a combination of the experimental results from the previous government studies and advanced physics concepts. Numerous recommendations outlining proposals for further theoretical and experimental studies are given in the report. The report also includes an extensive teleportation bibliography.

August 2004 Special Report
AIR FORCE RESEARCH LABORATORY
EDWARDS AIR FORCE BASE CA 93524-7048

You can find out more about Eric Davis here [http://www.icarusinterstellar.org/team/eric-davis/]:

Eric is currently employed as a Senior Research Physicist at the Institute for Advanced Studies at Austin. He is also the CEO/Chief Scientist of Warp Drive Metrics, and has provided contract services to the Air Force Research Laboratory, the Department of Defense, the Department of Energy, and the NASA Institute for Advanced Concepts. He was also a technical contributor and consultant to the NASA Breakthrough Propulsion Physics Program.

His non-theory theory is on page 60 of the report. Essentially he "explains" it as (my emphasis):

...a human consciousness phenomenon that somehow acts to move or rotate test specimens through a 4th spatial dimension, so that the specimens are able to penetrate the solid walls/barriers of their containers without physically breaching them.

It provides some nice imagery though:

Another property of higher dimensional geometry (Reichenbach, 1957; Rucker, 1977, 1984) is that one can move through solid three-dimensional obstacles without penetrating them by passing in the direction of the 4th (spatial) dimension. The 4th dimension is perpendicular to all of our normal three-dimensional space directions, and so our three-dimensional enclosures have no walls against this direction.

So the idea is that (somehow!) you take an object that's in a particular location, you diffuse it across 4D (time), before then refocussing it back into 3D in another location.

That's what I understand as well, but why does he specifically say "in the direction of the 4th (spatial) dimension"?

You mean, why does he say "spatial"? Because that's how it is conceived of in terms of unfolding experience [misleading vs the paper, see EDIT later for clarification]. How I might imagine this:

Life as 4D Environment

Our experience is like that of sitting in a 4-dimensional room, but only looking at one region or '3D slice' at a time. Our attention is gradually scanning from one end of the room to the other. To us it seems as though objects appear, change, disappear, but really we are seeing cross-sections of static objects laid out across the room. (e.g. A cone would appear as a dot which expands into wider and wider circles before disappearing completely.)

Teleportation is an experience you have when an object you've already seen is moved along the direction of scanning - so that you encounter it again in time. A bit like how Nathan Fillion appears in multiple places at once in this silly scene from Firefly.

Teleportation as Unfolding Experience

So, the experience of teleportation isn't spatial really. It's about locations in time rather than locations in space. As an unfolding of experience as moments from your 1st person perspective, looking through your own eyes:

- Moment 1: Seeing an object on the table
- Moment 2: Seeing an empty table
- Moment 3: Seeing a door getting closer
- Moment 4: Seeing the doorframe pass
- Moment 5: Seeing another room envelop me
- Moment 6: Seeing another table, with the object on it

The object was moved in time such that later on our "scanning of the 4D environment" encountered it again.

[EDIT for clarity: In other words, the teleporter is instantaneously creating a pattern across 4-dimensional space. The observers subsequently encounter that pattern as an unfolding experience in time.]

Implications?

If teleportation was possible in this way, then it would suggest something interesting. It would suggest that all our actions are 4-dimensional, and it's just our sensory experience that is constrained to 3-dimensions (scanning the 4th). Whether that constraint is a genuine limitation or simply a matter of habit, is something that could then be debated.

Time is not a spatial dimension.

Really? What makes you think that? It's a matter of perspective, surely.

There is nothing inherent to a fourth dimension that makes it a temporal dimension.

Right. I don't think you are actually disagreeing with me. It's a matter of perspective. Any dynamic pattern described by [x spatial dimensions + time] can be described from a higher perspective as a static pattern of [x+1 spatial dimensions].

In the metaphor, I stick to 4 dimensions because that's all we ever directly experience (any others are diagrammatic conveniences):

- From the perspective of the observers, the situation is experienced as [3D pattern + time]. In other words, 3D moments unfolding as time passes.
- From the perspective of the teleporter's action, the situation is experienced as an updating of [4D static pattern]. In other words, 3D moments all laid out.
- The 4th dimension is temporal from the perspective of an observer, it is spatial from the higher perspective of the teleportation act. Teleportation changes the "4D pattern" which we call an object "out of time" (or if you prefer, in time as viewed from a higher dimension, because "change" occurs at that higher level - 5th dimension.)

In other words, I am suggesting that our ongoing experience is like that of your attention scanning across a 4D static object, which a teleporter can update from the next level up.

TL;DR: One perspective's temporal dimension is another perspective's spatial dimension.

Q1: "The universe is 11 dimensional. 1 time dimensiob, 3 large spatial dimensions and 6 rolled up dimensions."; Is that new math?

Q2: No, it's string theory. And he used 'spatial' to show that he was explicitly NOT talking about time.

Actually, that's a good point to emphasise.

I included "(time)" to make it easier to understand - because 4D traversal is time for humans - but strictly speaking time is change and so isn't associated with a particular dimension independent of an observer.

It's probably more accurate still to say that the universe itself is non-dimensional - it's just a bunch of "facts". However, our perception and therefore our conceptualisation organises them into dimensions (depending a little on your philosophical preferences).

The salient element here is that space and time, rather than being real things-in-themselves or empirically mediated appearances (German: Erscheinungen), are the very forms of intuition (German: Anschauung) by which we must perceive objects.
-- Wikipedia entry on Immanuel Kant's Transcendental Idealism

No, you seem be misunderstanding. When physicists talk about dimensions, it is common to distinguish spatial and temporal dimensions, regardless of their number. This paper is speculating about rotation through a 4th spatial dimension. Time simply has nothing to do with this discussion, regardless of your conception of it.

Yeah, I do understand. But I was trying to provide an intuitive connection between the description of the action and the world as we subsequently experience it, perhaps confusingly.

[EDIT: Note, I'm talking about "p-Teleportation" here, which is performed on an object by a person unaided. I think we can't talk about that without connecting the act to the experience as it appears to unfold in time. My attempt below is probably isn't very clear, alas.]

What he's saying is that teleportation can in effect be described as a translation/diffusion across a higher-dimensional configuration space such that (x1, y1, z1) becomes (x2, y2, x2). It's not really an explanation yet though, since it doesn't connect to action or observation. In particular, I'm not sure it accounts for examples where the object disappeared for a while, and then materialised some time later, without additional action from the teleporter. This suggests that the teleport action might be better described as defining a sequence of events - in the form of a pattern, created at that moment, across 4D space - which the observers subsequently encounter. It's in this sense that I'm equating the 4D used for the action (the "direction" that the pattern was created along in configuration space) and the 4D of time (the subsequent experiences of the human observers in time).

wait, what? Chinese children have been stealing my socks and bread ties via teleportation?!?

Yes. They need the bread ties to help keep those big socks up.

...

Good summary of how it's described in the paper! I think it doesn't really work as an explanation for the effect, just as you suggest. Moving something 3D, "outside" 3D?

That's why I was thinking it makes more sense to say that an object isn't a thing, but is instead a higher-dimensional extended pattern. We can then think of an object as a pattern spread out across a spacetime 4D landscape, which you and I experience one 3D 'slice' per moment. This means the teleporter doesn't really move the object through walls at all, they modify its pattern across that 4D landscape. In this explanation the 4th dimension corresponds to a spatial dimension (for the pattern) which is also a temporal dimension (experienced by humans as "time"). It ties together the change made by the teleporter and our subsequent experience of the object being in a different place. That's what I tried to describe in my comments earlier, but I think I may have confused more than illuminated.

EDIT: The reason for this approach perhaps being appealing is that it could also be used for describing other PK effects. Even just having a "patterns across a time landscape" concept is very helpful.

I should say that I think string theory is a complete hack job in its introduction and handling of arbitrary "dimensions", so I'm sticking to the four subjectively perceivable ones. In the end, I suspect it is our minds which have dimensional formatting, not the universe. (See George Ellis's good Nature article from last year on string theory & friends.)

I think string theory is not well understood by everyone outside of it...

Agreed on string theory. My issue with it is that it brings to mind 'serial universe' theories of the early 20th century. They are really mathematical-philosophical constructs rather than scientific, testable theories. There are useful ways of thinking though, but their connection to actual observations becomes pretty remote.

What I would like to see is how the objects are moved from one place to the other.

Yes, this is an important area. It's not necessarily true that the change can't happen semi-instantly, though - if it's happening from a higher-dimensional perspective, then it's not our time that it's unfolding in. Even the word "happening" might not be a very good description. But it depends on the nature of the change, which isn't clear at all from the experiment.

All in all, I still think something's fishy in this experiment.

Yes, maybe. There may be a difference between moving an apple (like levitating it) and changing its location (teleporting it). The latter might more be like updating the co-ordinates from (x1, y1, z1) to (x2, y2, z2) by focusing on the target location. Again, it depends on the nature of the change. How were the teleporters going about this, as perceived in their own minds? Were they "moving the object" or were they "editing facts of the universe"?

Unless their explanation is that we only see the 3D projection of the object and the telekinesis happens because people are able to influence higher dimensions and not the "regular" ones. But this is really far-fetched.

It might be the most efficient explanation. Simply because we only experience a 3D sensory environment, doesn't mean our intentions don't apply 4-dimensionally, say. In fact, if we decide to raise our arm, might that be described as created a pattern across 4-dimensions which we subsequently experience in 3D 'sensory slices'?

The problem with this area is that we inevitably get into philosophy and metaphysics - where it becomes about painting a picture that joins the dots, but which can never be tested in its details. This is basically what string theory does. I think the phrase "far-fetched" has to be put aside when discussing this sort of thing! :-)

And I agree, this is more meta-physics/phylosophical than true science so I prefer to refrain from judging it because I don't think I'm qualified to do so.

I don't think anyone is. :-) All we can really do is come up with different ways of thinking about it, which might turn out to be useful, and be open to taking ideas from here and there. The way I think of it, all scientific theories are "applied metaphors". What varies is the number of "contact points" there are between the metaphor and easily-shared subjective observation.

- If there are lots of contact points and they're easily accessed, it becomes a proven scientific theory, an objective fact.
- If there are very few contact points but they're easily accessed, it might become an established philosophical position, a useful "way of thinking".
- If there are very few contact points and they're not easily accessed, it becomes a metaphysical view or it becomes a hand-waving description without details. (EDIT: 'Mystical' or religious knowledge falls in to this maybe?)
- Below that and there's no theory, just subjective experience and anecdotes. (EDIT: Glitches, mostly, so far.)

Science deals best with "easily observed regularities" which are very simply connected with sensory experience (because we think in "shadow experiences"). This stuff is difficult (assuming the reports are correct). You can't observe what someone is doing in this case and you can't observe what is happening. Any theory here is going to be a metaphor which is big on description, small on contact points!

Anyway, interesting to explore this stuff regardless.

lol i cant tell if you're serious or not

It's from a genuine paper by the US Air Force Research Laboratory. Whether you believe the Chinese accounts is another thing, but the US survey paper does exist (see my other comment). Even if it's nonsense, it's interesting/amusing that they took the time to investigate the nonsense and theorise about it, "just in case".

POST: [Proposal] Investigate How to Reprogram, Build a Wiki

Ah, you've also reminded me of this from [Realityshifters.com](#). The 'finding lost objects' approach is similar to one I've used for myself (let go of your body, "ask" for it to go and find what you've lost). I think the larger idea, of letting go and asking the world, has many applications. Relevant part of the page:

[QUOTE]

The Matrix Applied/Small Flight With Project Runway
Fighting Shadow - Everett, Washington

This is a summary describing how to do everything you've seen in the film, The Matrix, in what I call Project Runway. A few days ago, on a nice sunny Monday, I went with a friend to test a theory I've had for a while. We went to a local park for a new type of long-jump. Neither of us had been in track or sports for at least a year. We set up some sticks in front of a hill for us to jump over. Our objective was similar to what Morpheus advised Neo in the movie The Matrix, "Let it all go, Neo. Fear, doubt, disbelief [and love (explained later)]."

We started small, jumped it, then made the jump larger. This went on for 20 minutes before I looked at how far our last successful jump was. I couldn't comprehend it (and had to quit for the day because I started thinking about it). From only jogging (if we ran, we only got half-way), we both successfully jumped 16 size 13 feet! (we had no ruler). As in, take a size 13 shoe, and step 16 times, heel-to-toe. Quite a long way for jogging, huh? I swear we flew for at least a few feet as well, when we did it right, because sometime in mid-air, I felt completely joyful, and closed my eyes. You'll have to try it to find out though...

You try it: Method explained.

My theory involved letting go, as explained above. But first, here's some history. No "finding lost objects" techniques ever worked for me, not even using my awesome "third eye manifestation". So, soon after I started thinking of the body as a "shell", I said "shell, find my book." and it did, instantly. Then my towel, then another book, etc. Later, I remembered it's just energy linked to the mind. So I consider it a function, not even a physical thing (this is important in letting go). Then, sometime after that, I began experimenting more, and learned to stop thinking. Yes, when you don't think, sparring's easier, and so are sports. In order to obtain this state, I decided to use the Buddhist practice of mindfulness. It clears the mind quite well. Remember people telling you "not to think about it so much"? Well, forget that, just don't think. Now, one last thing. I said that you'd have to let go of love as well. I believe this is explained somewhere on [realityshifters.com](#) in the Let Go of Wishes article .

The idea is, you can't hold on to love, so just let it go, and it will flow naturally. Love is also the energy to live, fly, etc. (YES! You DON'T need to spend years gathering energy!) What I have learned is something others have also felt and written about. Reading Communion With God and Illusions helps a lot in understanding this. Remember to just let it go, and let it flow. Most importantly (because you have to stop thinking once you start running) is to trust yourself Ready now? Here's how I did it.

1. Set up your sticks/markers. Start out small if you're new.
 2. Find a place to start (I started on a small hill).
 3. Let go of all fears, doubts, worries, etc.
 4. Tell your body to jump the distance.
 5. Trust your self, AND your body.
 6. Be mindful, and clear your mind.
 7. Everything will suddenly just "click", and you'll know it's time to start.
 8. Keep a clear mind, free from negative thoughts, and don't force anything. The speed of your run does NOT matter. Trust you will fly.
 9. Repeat until you want to stop.
- Tomorrow or the next day, I'm going out to train again with my friend. I know I flew, and I'm gonna do more than just jump far.==

[END OF QUOTE]

...

Ha, I didn't mean the "flying" bit (although you never know, with practice). I meant the letting go and allowing your subconscious mind to guide you to, say, an object you lost but can't remember where it is. It works for problem-solving in general, actually.

Although -

People can not fly. If this was possible you'd see it at the Olympics.

What he describes isn't flying; it's more like being in the zone and letting your body use its natural coordination to jump the distance without you interfering by trying to "make it happen". Which is probably what really good Olympians in fact do.

POST: So, my kitchen light moved. And I'm in an alternate universe apparently.

This means, you realise, that is no longer your wife.

See here:

"The day I posted one particular reality shift story, I had woken up to find my key chain had turned gray. My boyfriend and I always had identical key chains (actually they were the lock devices that came with our Jeep), and they were both black. When one of us picked up a key ring, we had to look not at the black device but at the collection of keys, because we had the same house, similar cars and other things -- so we had to look to make sure that the gold keys to my office were on the key ring or not in order to determine which set of keys was which.

One day, I woke up after a fairl[y] hard night of half sleeping, to discover that my key locking device was now gray. My boyfriend never remembers a time when my key chain wasn't gray, and he insists that a difference in color is the way we always told our otherwise identical key chains apart, which makes me think I also do not have the exact same boyfriend anymore."

-- Changing Keys / Instant Costume Change, [Realityshifters.com](#)

You should think yourself lucky, and perhaps not look at that lamp too closely. No matter how strange it might start to seem.

Q1: His other self married her, and he is now that other self. By that standard, she is his wife.

But, he's not that other self - he's the same self, now looking out into another world. She is not the woman he married, in his old world.

Q1: No, but she's not a different person, she's a different version of the same person. He, too, is a different version of the same person she married.

Okay. How different does someone have to become before they are considered a different person? What is the connection between this woman and his wife in the other 'reality'?

(The fact of his knowledge alone means he is substantially different to any other person with his body; her lack of knowledge means the same thing.)

Q1: If he can just randomly appear in the other person's body, in the same home with one subtle difference, the same life, without even an apparent death to explain the switch -- the two are clearly closely linked.

We could think of it as being the same "person" (soul? experiencer?) but looking through the "viewport" of a particular body in a particular environment.

That works for him. But what of her? In fact, is there even necessarily a "person" looking through her eyes? Could she just be a philosophical zombie, operating on automatic with no "experiencer" looking through her as their "viewport"?

(The more extreme possibility is that of "personal dream-worlds" - that we are each living in our own dream but they may/may not overlap with others' dream-worlds. So his change is then just a discontinuity, a shift in his dream-world, perhaps in response to his desire and irritation regarding the light. She is just his dream wife. There may be a wife having a dream-world of her own, but that dream would only interact with his to the extent they have common desires of experience. In this scenario, we are "extended persons" of some sort.)

And what could have caused that be the case? I see no reason for him to have switched to a world -- this world -- where she is just a hollow shell. I see no reason for this universe's version of him having been a hollow shell before this version of him appeared in our universe's body, either.

Well, it might make no difference - most of our actions and responses are automatic, it's just that we experience them. We can, if we choose and if we know how, redirect ourselves and our path though.

There is more to our consciousness than we know. He most likely is one facet of a consciousness with multiple bodies, experiencing a multitude of existences, in different universes. That he cannot consciously connect to the other parts of the consciousness does not mean that they do not exist, or are not linked.

Actually, I do prefer this - what I call "extended persons" - but it's hard to tell the difference between this and the "viewport" version with a single experiencer. A hollow shell can behave exactly the same way, externally, as someone with an experiencer, or as an extended person would. In fact, perhaps his wife's behaviour is dependent upon his expectations, rather than being autonomous herself. With the extended person idea, and infinite worlds in which to express all possibilities, other people actually do correspond to our expectations/beliefs/desires (even if those are detrimental to us). Combining those ideas: Everyone can get their ideal world. You are extended throughout all possibilities, but only need to experience the possibility-version that you want. Extended persons and viewport-like experiencing.

To me it seems just as worthwhile to point at random people on the street and state that they might be hollow. Well, yes, they might be. But how is it relevant to this situation?

It's to do with the mechanics of the change, and what we're really experiencing right now. A "hollow" person needn't be any different to anyone else. Because you are effectively acting as a hollow person most of the time - you are on automatic. Being "hollow" just means not being observed through. It's easier to say that there are infinite universes each with a /u/TriumphantGeorge and a /u/parafact in them, but we "the observing consciousnesses" only look through one at a time. When we interfere, then we jump to looking through one that corresponds to our desire/intention.

We are always experiencing never actually doing. Human bodies are part of the surrounding environment, seamless with them. We are not the bodies, we are just the experiencers of bodies and environments.

I absolutely disagree that we are only looking through one universe at a time. It's just that the part of me that is aware of looking into this universe is only able to be conscious of looking into this one.

It depends on what we mean by "we". Right now, I am only experiencing looking through this universe. I can imagine that other parts of me are looking elsewhere, but if I can't experience it right now, where does that leave me?

I also still do not see the point of contemplating the potential hollowness of OP's wife specifically when, by both your viewpoint and mine, she is equally likely to be hollow in this universe as she was in the last one -- though we disagree on the actual likelihood. Nothing has changed in that regard.

You have exactly the same problem with your "I am looking through all universes" view - it's not testable. You - you right now - only ever experience one universe at a time. If you "jump universes" you will then experience that one, not two at once. Meanwhile, you can't tell if the wife is "hollow" or not, because it makes no difference to her behaviour. However, if you are only experiencing one universe at a time (which all the evidence points to), then we can assume that is the same for her, and that given infinite universes, it is infinitely unlikely that she's looking out of those eyes. However, the universes (personal world-dreams) must overlap in some way. We are all alone, but our worlds are "inspired by" the intentions and choices of all other universes as well as our own.

EDIT: That read as being "shouty". Not meant to be, just quite interested in bashing this out. :-)

The essence of this is, "what is a person" and does it require awareness, a "presence" that is experiencing it? I say no. So why do we need every universe to be "looked-through"? You just pick the one you like best! The rest will roll along by themselves.

Previous attempt to visualise this here [POST: Meta-switching realities].

...

Just decide you are going to notice them. Then you will.

POST: I dream about the future then live it?

[POST]

So this has been driving my completely insane recently and I've decided to share my weird reoccurring glitch. I dream about and relive days of my life. Now I know how crazy this sounds and I've looked all over for an explanation and I assure you it's not me having deja vu mid day and thinking I had a dream. This happens about 4 times every year and is usually started the exact same way, with me having a dream about my life. Now before the incident I'm about to describe I pinned this on stress and told myself I was just making these things up. However this latest occurrence has me 100% sure it was a glitch in the matrix. Now I've gotten use to these rare dreams of mine but the latest one bothered me because it was so vivid. I specifically remember seeing these pile of blocks when I woke up and someone saying "Frank what if we merge our two piles will my green go with your blue?" The other thing I remember was a co-worker of mine named Jennifer saying something about her son and a baseball injury. Due to the vividness of the dreams I kept thinking about them all day mostly the blocks and what such a strange phrase could mean. Later in the afternoon we had a surprise team building exercise with... You guessed it! Blocks. At first I thought nothing of it because I had become preoccupied and was not thinking about my dream at the time. The goal was to build certain structures out of these blocks, it began with basic triangles and then it got more advanced to the point we needed to share blocks but every block had to be used in the construct for the team to pass. I was looking around the table trying to figure out how we could build a tower we needed and I noticed me and my co-worker frank had an extra pile of blocks and blurted out "Frank what if we merge our two piles will my green go with your blue?" As soon as I heard the words come out of my mouth I froze and remained very quite for the rest of the exercise trying to rationalize what just happened. After the exercise is done we all head to the break room for some coffee and bagels. While everyone is chatting I hear Jennifer talking to her friend Cathy, I was very hesitant to ask but I forced myself to do it "By any chance did your son get injured playing baseball recently?" Now I have no outside work Connection to Jennifer so her immediate reaction to me knowing about that injury was to think I was a stalker but I quickly explained to her my dream and convinced her I was not a stalker but she was still pretty sure I was insane. Creepy right? But here is where it gets extremely bothersome and the reason I'm debating putting myself in a mental hospital or some shit. The next day was exactly the same. No dream this time but the day was exactly the same down to little details. The surprise team meeting was held again with the same problems and initial reactions (the confusion and brainstorming were the same right down to the wire) I was even in the same position where I almost asked frank if my greens would go with his blues. As we walked to the break room Jennifer was talking to Cathy but I decided to not ask her about the injury this time. Instead she ended up telling everyone about it herself! How could I dream about something happening if the knowledge of the event caused it to not happen originally?!?!?!? To this day I still have these episodes randomly but none were as vivid (or maybe I was not as aware) as this one. Please tell me I am not alone in this and other people have also experienced freak time travel combined with dreams of the future.

Edit: please forgive formatting and errors, I am on mobile.

[END OF POST]

Q1: There's no need to be alarmed by this, it's perfectly okay. In fact, many people have access to this ability, but tune it out or try to rationalize it away. The thing is, most of our experiences are lined up days before they actually play out in physical terms. So, more sensitive people can get glimpses of the "blueprint" of the event. This often happens in our dream state, because we are less resistant at that time. Take care and have fun with it :)

It's all deterministic, unless you actively choose to "re-direct"?

Q1: Determinism would imply someone running you life for you. Rather, we have complete freedom of choice- our expectations shape these blueprints. It just takes some time to assemble the cooperative components for the physical manifestation.

No, determinism would imply that a path just "plays out" via its own momentum. When a rock starts rolling down a hill, it doesn't need gravity to keep pulling it. It will keep going until it is redirected (by a collision, or by a change in the landscape). I think we have free choice to re-point the path, but if we don't then it plays out deterministically. This is why we can tell what is going to happen: the whole future is effectively here, now unless we make an intentional change that affects it at the ground, seed level.

Q1: Ah, I see what you mean.

It's a common point actually. Do we control our actions, moment by moment? Do we constantly intend? No, I'd say we experience ourselves rather than do ourselves - except when we inject a new target into awareness (reshape ourselves). Just as well. I quite like that my blood supply is self-circulating, for instance. :-)

EDIT: Although some people do a constant 'holding back' of themselves. Perhaps most people, even. They don't fully commit to their own flow.

...

Q2: Souuuuuuuurce?

Q3: (It's total garbage, but don't tell anyone I said anything, I'll get downvoted to hell for not believing in supernatural bullshit.)

Q1: Eh, life would be much less fun without the variety of opinions. So we can probably agree they're all valuable. Everyone finds their own little nuggets of truth- who cares, if others agree with them, or not.

Q3: Most of the stuff posted here is 99% batshit insane. There's a few 'actual' glitches that I nor anyone else can explain, but when it's stuff like "I dreamed about the future", I chalk it up to either 1. a brain issue where the person actually thinks they had a dream about that day, or 2. hyperactive awareness in their daily life that allows them to perceive a possible 'future' that just happens, and then they think they are special in some way. When something posted on this subreddit is only observed by the OP, then the OP should have talked to a doctor to get a brain scan. When it's something like "I have actual proof I jumped into a parallel universe", then I'll be interested. what I'm trying to say, is that for a glitch to be considered real, it should be verified by at least a bystander or a friend, not just by the OP.

Q4: I believe everything follows fundamental laws that we as human beings cannot break. We can't escape from the universe, we can't enter a black hole without being crushed to the size of an atom, and we can't go faster than the speed of light. As for the question, I believe we have 'free will' in the sense that we can weigh risks vs reward, and make decisions based on that. Unless you have a different definition of free will, I'll stick to that answer.

Of course, nobody's ever tried those things to find out...

As for the question, I believe we have 'free will' in the sense that we can weigh risks vs reward, and make decisions based on that. Unless you have a different definition of free will, I'll stick to that answer.

Isn't that deterministic though? Your preferences are already determined, so your choices are already determined. You might "experience thinking and choosing", but really there's no influence you can have over it. It's all just unfolding, as it always going to be. (And for this reason, nobody has "abilities to see into the future". The future is already there, in a sense. So it's not unreasonable you might end up knowing, but you wouldn't be doing it; the thought would just happen to you.)

Although other views are available [<http://www.mth.uct.ac.za/%7Eellis/realworld.pdf>].

Q4: It's deterministic if you start from a certain point in time, for one decision. If you start from the very beginning, you're making your own choices (through guidance of parents), and that shapes who you are as a person. Both through nature(genes), and nurture(environment). For instance: I would never eat crickets on a stick. In China, it's a snack you can buy. People love it.

If you start from the very beginning, you're making your own choices (through guidance of parents)...

Is that true, though? I'd have thought the parents and environment were part of the "deterministic" input, so what you've said mean there's really no choice, because you don't choose your nature. You actually never chose not not-eat-crickets-on-a-stick, that choice was pre-made for you by your upbringing.

(Note: I personally believe we do or can have some top-down influence, but it requires a bit of dis-identification with our own body and thought processes.)

Q4: Well it's not like you can be raised by wolves. If you were, and you survived, you would eat meat and berries. You wouldn't know language, and you'd be naked... unless you thought "hmm, fur is warm, I'll skin an animal".

Well, that's determinism in action! No real choices. Wolfy-behaviour all the way.

Q4: You still have choices. "Should I follow this hard rocky road with metal animals?"

Haha. :-) But your options are pre-determined by your upbringing and experiences. In turn, your upbringing led to your nature and preferences, which determine which option you will choose. So it was always going to happen the way it did: loudly squished under the metal animals due to ignorance!

EDIT: Although personally I believe there is the possibility of creativity in the options which appear to us mentally, if we give space for it to occur.

Q4: Okay, then say you get taken away from your parents due to some bullshit. Now you're in a foster home. Your entire life just changed based on that alone. You have free will to hold on to the values your parents instilled, or you can try to get over the trauma of being taken away from your parents, and live out happily with the foster family. Every single person has free will. As a collective, we guide each other.

You have free will to hold on to the values your parents instilled, or you can try to get over the trauma of being taken away from your parents, and live out happily with the foster family.

How do you make the choice? Does the choice you make not come from your 'character'? Did you choose your character? But...

The way out of this is to say: Free will isn't the ability to do just anything, randomly - rather it's to act according to your own nature, given the information available to you. The extra secret sauce is if you discover the technique/ability to "ask for further options" from your creative mind (or whatever). Then, although you will always make a choice based on your nature (determined) you at least have the possibility of a fresh direction (creativity) - which in turn will change your nature. If you don't discover or aren't introduced to the secret sauce, then you'll pretty much unfold deterministically for your whole life. Fortunately, you'll likely be unaware of it. And if you were, you'd respond deterministically anyway...

This whole conversation really boils down to your own definition of what free will is.

Quite probably. Basically, it's a kind of meaningless topic for most people! It doesn't matter if your choices are effectively determined in advance (by upbringing, environment, inherent character, this is a common philosophical argument against free will), so long as they're aligned with your best interests. For most people, that's enough.

Although I'd say that the extra bit: That the options are not necessarily pre-determined, means we have the ability to creatively change our world, rather than simply react to it and be a cog in it.

(Personally, I believe that we can get stuck in a reactive mode, but that we generally do have the ability to live creatively and not deterministically.)

What's your definition?

Q4: My definition of free will is being able to do anything that you desire. If you want to go on a rampage, you can. You will probably get shot, but that's just something that happens. People can snap. They can act any way they want, but they choose to go along with daily life.
An example: I want to uproot my life and move north into a forest. I hate the way society behaves, and I think it's absolutely ridiculous that people feel like this is the way life is (and there's nothing we can do about it). If I chose to go right now, I could. My family would be upset, and my friends would turn on me, but I COULD go. I'm completely free to do so. It is my choice, and my choice alone.
Free will is essentially freedom to act and think the way you want. There's consequences, but that comes with others disagreeing with the way you're acting/thinking.

All good. As Wikipedia says, "The underlying issue is: Do we have some control over our actions, and if so, what sort of control, and to what extent?"

So, you are free to do all those things. But are you free to "want what you want", can you choose your thoughts in advance, are you a victim of your impulses? To what extent are you choosing your actions, to what extent are they happening to you? On what basis are you making the choice that is "my choice, and my choice alone". That's the philosophical dilemma of free will (rather than just "freedom").

In that case, whether you consider you have 'true free will' or not might be about where you draw the line - what you consider as "you" and what you consider as external or "the environment".

"Everyday free will" is just the notion that, based on the information you have, you will make choices in alignment with your own character/nature. I think that's fairly straightforward, and what you're going for?

Q4: Again, you're trying to change the definition of what free will is.
free will: noun 1. the power of acting without the constraint of necessity or fate; the ability to act at one's own discretion.
Based on this definition, we have free will.

The definition is half the problem, but going with that:

the power of acting without the constraint of necessity or fate; the ability to act at one's own discretion

People could argue - if you examine exactly how decisions and actions come about - that you'll find you are actually entirely subject to "necessity or fate", and that the "discretion" is therefore an illusion, simply an experience you have. Note, I'm not really arguing with you! In practical terms, everyone experiences having free will - they just know they are agents, directly. Logically though, it's hard to prove. But then so is consciousness, which is essentially the same thing (free will being "first cause" if it exists at all). And everyone knows they are conscious, simply by the very knowing itself.

POST: Not sure if this is a glitch or reality

[POST]

I'm going to explain this the best I can then provide several scary examples. I dream EVERY night. They are vivid dreams. I read, write and interact with strangers, family and even go to work. I've heard that it's impossible to read in your dreams (because that part of your brain isn't active?), but I do with ease. Writing is a bit if a challenge and my handwriting looks like a child's. Anyway, I try to forget these dreams- but they always come back to bite me. The dreams make no sense when I have them. Events are out of order and often I have no idea why I'm somewhere or doing something. If the dream seems important or scares the shit out of me I tell my SO, that way I can point out in the future that we knew it was going to happen. Ok, so these dreams come true. They are impossibly accurate. Every job I've ever had, I've dreamed about months or years in advance. Jobs I could never imagine myself doing (and I mean never!) and yet, they happen. Before you say the dreams are influencing my choices, no, not the way I dream. Example (not scary)- I dream I'm sitting at a desk, calculating percentages and gazing out a window. Out the window I see a tree with its leaves blowing in the wind. On the desk I see some sort of statements, stapler, little do-dads , your typical desk. I wake up thinking what a crazy dream, I'd never voluntarily take a desk job. I'm a typical blue collar worker. Low and behold six months later I apply for a bread delivery job(as a second job). It was a few months into the job at the end of a long day. I had to bill each customer for the bread I delivered and discount for the un-purchased bread I removed from the store. There was a desk in the rear of the bakery positioned directly in front of a window (it wasn't mine but I was allowed to use it). Frustrated from the paperwork I look up to see the tree outside and wish I was done for the day. Then it hits me like a brick, the tree. The desk. The paperwork. The do-dads. It's all there. Next dream - I dream I'm holding the most beautiful baby infant, though it's definitely not mine. I smile and somehow know this baby, but I don't. It was a girl that had blue eyes, and dark black hair. I'm alone in a beautiful Park like setting. I can't see very far in any direction because the sun is absolutely blinding. I wake up it's early morning. I can't go back to sleep so I have a very long day the next day. I lived over 1500 miles away from my family. But the next day I get a call. My sister had had a late term miscarriage. I asked her if it was a little girl with blue eyes and black hair. She wondered how I had known. Somehow I thought it would help comfort her so I told her I knew when her baby died because she came to visit me. My dream occurred at the time she was in the hospital giving birth the night before. Next dream- I dreamed I was in two rooms joined by a doorway there was literally 100 people there. I didn't know any of the people. Somehow they all knew me and were talking to me and touching me. I found this very uncomfortable my eyes search the room for someone I knew. Then I saw my father. I ran to him, opened my mouth to speak then I woke up. Later that year my grandfather died who lives in another state. Not just another state but on the complete opposite coast. I went with my father to his funeral. You guessed it I was at the funeral home standing amongst lots of relatives that I had never met. Somehow, I lost my father in the crowd. I looked around for him and spotted him in another room. I hurriedly went towards him and as I went to speak I realized instantaneously this was that dream. It scared the living shit out of me and I could not speak. The problem I have is my dreams are broken bits and pieces. I cannot pinpoint these events that will take place. I only realize what is going on as it is happening. Have I dreamed about my death? Yes. More than once. I will not elaborate, I have heard that you can influence your surroundings more than you know when you speak out loud/write about incidents and it's possible to make those things happen. I'm not risking it. Apparently this runs in the family- one of my parents also has these predictive type dreams. They can truly be horrifying. I also seem to have weird glitches in this reality. I'm a relatively shy person and I try not to make eye contact unless I must in my daily routines. I've had more incidents than I care to recall of seeing someone who is gone mere seconds later. For instance, I was walking out of a building towards a smoke break area. I was looking down to avoid eye contact with a man that was coming towards me. I passed the man then turned to ask how his day went, the man was gone. He WAS there a few seconds ago. I walked past an office and saw a man sitting in a chair with the lights off. Being familiar with the men who often work there at night I turned around to ask WTF he was doing with the lights off and to have some friendly banter. The was no one there. It's not uncommon for co-workers to nap on night shift, so it didn't strike me as odd. I've never been on drugs, medications, I don't drink except on rare occasions (maybe once a year). I've never been arrested. I was raised religious, but do not attend church. Does anyone else have similar experiences? Are you able to influence the outcome of reality because of your dreams? Is there a way to shut off my dreams? Anything over the counter? I never feel rested when I wake up. The dreams wear me out physically and mentally. I posted anonymously for obvious reasons. If someone told me this, I'd think they were crazy or on drugs. For once Id like to sleep with no recollection of dreams.

[END OF POST]

The "shy person" glitches are likely due to you not truly looking at your surroundings. Your mind just makes a best-guess based on peripheral vision and so on, and fills in the environment accordingly. When you decide to deliberately look directly at the "person", your mind-model gets updated and the person disappears/becomes a shadow/whatever.

The dreams, though, are fascinating! Well, "all time is at once" it is said, so it's already happened from some perspectives. You should maybe play with trying to deliberately imagine situations you'd like before you go to sleep. Some New Thought people used to say that this worked. Worth a go [<http://www.thepowerofawareness.org/>], as an experiment... you might be able to improve the usefulness of your dreams by doing it.

No, although I don't look at faces as I pass people I see their bodies(often from the chest down), gender, what they are wearing or holding.

Right, that's a bit clearer. Don't know if you've being trying to do lucid dreaming deliberately, but that's maybe worth a look, /r/luciddreaming and the Robert Waggoner book perhaps. Might let you get better control in the dream of yourself if not the situation, keeping calm, the better to ask questions and so on. They sound quite challenging anyway.

What do you think's happening?

EDIT: Just read your other reply on the dream control thing.

i know this stuff is going to occur.

The certainty is interesting. And I think you're right: you can know and it will happen. But...

You should read the Neville Goddard book, but for one idea: That although our lives are deterministic in the sense that they unfold along a fixed path if we don't interfere - we have a "destiny" - we can re-direct our lives, and re-point that destiny. However, this isn't necessarily by action (because we'll pre-dream our actions), but by changing your momentum in some sense. I dunno, it seems to be the sort of thing he was saying (PDF here). Whatever you think of that, his little exercise might be useful for you (summoning the feeling of the new direction, in your dream or otherwise). In some ways this makes sense: If you always act in character, then even "spontaneous" action would be in-character and therefore inevitable. Only by changing yourself can you change how you might respond to something in the future, and change your fate?

I'm sure you've experimented with trying to change things, but maybe it can't be done the way you've been attempting it so far.

POST: I think I entered another dimension...

[POST]

Something is weird here. I don't exactly know what it is for sure, but I know when it started.

A couple days ago I was walking through one of the dorms on my campus. It's the oldest dorm, built pre-WW2, so there's some weird quirks about it. Also, it's incredibly hard to navigate your first couple times. I was going through it to study some calc and had the hardest time finding the right stairwell to get to the room I needed. I went up one set of stairs and saw a sign pointing me towards the set of rooms I needed to go to. I turned left and followed the hallway. I saw a girl with her door open talking about econ, walked passed some guys heading towards the dining hall, and saw one guy knocking on another person's door. I reached the end of the hallway and the only thing there was another stairwell, not the room I needed, so I went into the stairwell.

I saw a sign saying I was on the floor below where I thought I was, so went up the stairs again, confused. One flight up, I saw the same sign that led me to the left. I passed the same girl talking about econ, same guys going towards the dining hall, and same guy knocking on a door. I was really confused at this point, but saw the room I needed to be in at the end of the hall.

Things are different now though, and nobody is admitting it. Every stranger I see in the street makes weird eye contact with me. It's as if I'm not welcome here. I bring this up to my friends and they just laugh and change the topic really quickly. My friends are acting strange too, as if they need to keep an eye on me at all times. I stood up to go to the bathroom yesterday and my roommate said he'd go with me, which I thought was weird. Even weirder when he just stood there and didn't say a word while I peed. Other friends suddenly want to go out of their way to walk with me to my classes. I don't know what's going on, but I feel like I don't belong here.

EDIT: Just to address some issues that plenty of comments have brought up:

a) I am most certainly did not dream it. I have in my notebook a series of notes I took that night, so unless this is still a dream then I was perfectly awake.

b) I understand that people making eye contact isn't necessarily abnormal, but their eyes are telling me something now. They're looking at me like I don't belong. It's a look of disgust, and "what is he doing here?".

To make things worse, I've been pretty thrown off by this so took the half hour train ride home to visit the family for awhile. Things seemed normal, my parents were fine, but my dog barked at me repeatedly. He's never done this before, not even the times that I've visited home before, and he wouldn't stop. He was angry at me.

EDIT 2: After a relatively normal afternoon and dinner with the family I came back to campus. One comment suggested I go back to the stairwell. I'm not really sure what I expected, but I went back anyways. It's like people didn't want me to go back. More than the weird, hostile looks I'm used to being given, people were bluntly bumping into me as I walked towards the dorm. I get to the stairwell and feel fine, everything seems normal, until I almost shit myself when I heard a guy behind me say "You're not supposed to be here". I walked quickly out of the dorm and made way towards my own hall, and people were much less resistant to me walking back. I don't know guys, maybe your reality isn't my reality.

EDIT 3: Went to the University health services office, as people suggested. They recommended me to a psychiatrist, and I was luckily able to walk in to see him. I explained my problem to him, and he had this grave look on his face while I was talking. Once I finished, he simply explained that it must be all in my head and hurried me out the door. I asked if there was anything I could do about this and he told me I was just imagining things.

Strangers are becoming much more aggressive the longer I stay here. At the dining hall this morning the employee that was swiping student IDs had to ask her manager if I should be let in. The manager gave me a weird look, but acted like he didn't want to make a scene and said sure. I was walking to class with a friend and one guy looked me directly in the eye and just said "leave". People intentionally bumping into me is now the norm. They have a look of disgust in their eyes. I'm starting to think that I really don't belong.

EDIT 4: People have been asking for an update, and I wish I could say things have been getting better. Still the same rude behavior from random strangers; the other day I was asked to leave the library because I was "a disturbance to the other students" when all I was doing was reading my textbook. It's finals week right now, so I haven't gotten the chance to see help outside the University. My friends are still concerned about me, and my family still acts the same. This is all becoming "normal" unfortunately.

FINAL EDIT: I've come back. It was the strangest experience. I was at the dining hall with my friends and this girl was looking at me the whole time. But it wasn't a bad look, it was friendly. And something was different about her--she seemed just ever so slightly "off", I was drawn to her. After I ate, I told my friends to go without me (which they hesitated to do, but eventually complied). I went up to the girl and before I knew it I had told her my entire story. Every built up frustration, every tear, every bit of confusion, and she just listened. When I finished, she looked me in the eyes and said "Follow me". I did, and she took me to a bridge over a river that connects two parts of the campus. She held my hand and told me to close my eyes. I felt a strong gust of wind and next thing I know I was on that bridge alone, but things were normal. People no longer make disgusted eye contact with me or are rude to me, my friends are normal again, I belong. I have this overwhelming sense of joy, and I think that whoever this girl was knew that I was in the wrong place and somehow knew how to fix that.

[END OF POST]

So, this is the most interesting glitch in ages.

Any other changes? Minor things, even light switches being the wrong way round, things like that? Some people have tried to make changes deliberately and small glitches result (if one believes this):

. . . I wasn't upset by this, I didn't believe in it anyway, so I went home without expectations or anticipation about how my universe might change.

That night I set to making dinner, but when I turned the knob to light the burner under my pan of water for the pasta, the burner behind it went on instead. I had been living in this apartment for close on five years. The inner knobs had always lit the front burners and the outer knobs had always lit the back burners. I got one of my room-mates to come and see. "But that's the way it's always been.", he said. No one else remembered it the way I did.

Later that night I called Ebony. He laughed, but he seemed impressed, "You must really be doing your will if that's the only change your universe needed to balance it."

Considering some of the horror stories I've heard related I'm grateful that a switch of the oven knobs was all it took to convince me of the reality of magick!

-- Some memories of Ebony

The overall vibe of "not being in the same place anymore" reminds me of my favourite story on another website:

Suddenly everything had changed. My buddy was not quite the same guy I had known moments before while sitting peacefully on the trestle, the river I knew so well had changed, my home was different, everyone and everything was different, yet appeared somewhat the same.

Everything looked exactly the same as it did before yet it all had a different feel to it. It's as if everything was replaced with identical stuff. It's like accidentally putting on someone else's coat that looks just like your own, but it just doesn't feel the same and the fit is a bit off. It's like walking into a motel room. It's like driving some else's car which is identical to your own.

The way people are different is also hard to describe. They seem the same, yet they act just a bit off from their usual patterns. They don't send out the same vibes. It's as if you are meeting them for the first time. You know them, yet you don't feel like you know them. They seem to be close copies of how you remember them.

-- Realityshifters.com

Having said all that, you have to be careful and not over-interpret.

If you change or shift for some reason then your world will seem to change and shift. One theory is that, like with shared dreams, we are each in our own dream world but we overlap with others via common "archetypes". If we meet in a restaurant, my Wendy's might be your MacDonald's.

If something glitches - which really means that you hiccup in some sense - then the environment image spawning from the archetype might shift. Our environments are made up in our minds; it's just that we don't notice it. This includes our experiences of other people: they are "filled in" based on very minimal information. You dream most of the details of your experience, spawned from a loose outline, in an ongoing feedback loop of enfolding and unfolding.

Fig 1. An illustration of the relationship between enfolded forms (belief, expectation, memory traces) and unfolding experience. In an ongoing feedback process, experiences leave traces which then in-form the structure subsequent experiences, as spatial and temporal structures - i.e. objects and narrative, respectively. To change the nature of experience requires exposure of the ground to alternative types of experience ("external" change) or a shifting of the form of the ground directly ("internal" or first-cause change).

You might be experiencing an extreme version of that.

EDIT: Does anybody else remember a story (might be here, /r/occult or /r/psychonaut) where everyone on the street suddenly stopped and turned around to look at this guy, who was sitting in the shadow of a doorway or something? Like he'd been "discovered" by the other characters/figures?

Q1: The second one sounds like Capgrass syndrome. Where due to a mini stroke in the 'familiarity' path of the brain, everything seems to be replaced by copies or 'imposters'.

I'm not sure about 'familiarity paths', but yes it does sound like that. A few glitches here have a variation on it: The guy who 'glitched' in his drive and everything changed (car colour noticed first) and was unfamiliar (not his wife anymore); the guy who didn't have that new car after all seems related too. Of course, "brain problems" might just be the in-world ad-hoc explanation provided for the change when you "jump"... ;-)

...

I am most certainly did not dream it. I have in my notebook a series of notes I took that night, so unless this is still a dream then I was perfectly awake

In a way, this might be true. If you did "get back" would it be a waking up into your previous world, from here?

Q2: late to the party and I hope that it hadn't been said before, but have you thought about the fact that somebody could have spread (negative) rumors about you? a crazy ex, a deluded friend...did you have any fight or argument with somebody on the campus? this could explain the strange behavior of your friends (who believe the rumors and are not concerned about you, but more about themselves)..the fact is that often we understand the things subconsciously but we cannot explain it rationally. this could also explain the other students' reaction:can be that in some way this rumor is big and everybody knows "about you" or alternatively, could be just this "bad vibe" that your friends are sending you - and you don't understand rationally- makes you a bit paranoid about everybody else...

So your TL;DR is: "You're not paranoid, they really do hate you" - ?

Q2: this made me smile :) I didn't think it exactly in that way, but yes, I think before talking about alternate universes better discard all the other practical options...

With your help, I think OP may be finding the idea of being irretrievably cast into an unfriendly parallel reality is getting more appealing! :-)

Q3: Your story reminds me a glitch I read once (not here) where a woman shifted in another reality and people there looked at her weirdly , some seemed upset to see her. Most people had a hostile attitude towards her. She sat on a bench in a park and a woman came to tell her: You have nothing to do here, you do not belong to this place. She tried to explain that she did not even know how she ended up there but the woman would not listen. Finally, she walked a little and one person came to meet her to tell her that she had nothing to do there and explained her how to return to her own reality. The only difference with your story is that in her case the place was unknown to her. You should go back to the stairwell and if someone talk to you, don't be shy or afraid , ask him/her questions.

Thing is, we are those other people, right now.

Q4: Anyone else think this is a very clever no sleep? Wher3 everything is real even if it Inst? Otherwise welcome to the other side breather we be got the habit movies hope theywerent any better in your dimension

The individual elements are pretty common in Glitch reports, just not usually together. The "lost track of where I was / the map seems to change or repeat" element (seizure/disorientation type symptoms), the "people aren't who they used to be" thing and the world responding to me a bit differently (Capgrass-type symptoms). But: it's not quite inventive enough to be really absorbing as a fictional story or lead-in.

If I were inventing something, I'd go nick some of the stories from /r/psychonaut, like on this thread
[https://old.reddit.com/r/Psychonaut/comments/25q6o7/ego_death_from_mushroom_causes_instantaneous/chjt4dd/].

Q4: *health context aside I'm starting to blur the lines when I read this sub, most posts are entertaining*

I treat 'em all as real for the purposes of commenting, unless they're so obviously fictional prose that it's not even worth the fun.

Thing is, a lot of it is quite reasonable once you've had a couple of experiences yourself - not necessarily dramatic things. Just, say, seeing through your eyelids, dark vision, things shifting before you. Perception isn't as straightforward as you assume. And once you notice it, you see it all the time. You're basically sort of dreaming your environment, based on very minimal cues and updates. (I mean, this whole room looks in focus to me now. But that actually isn't possible if I'm directly seeing with my eyes.)

*Q5: I just found this post randomly. I had a very similar experience back when I used to party really hard. It was at a point in my life where I was drinking heavily and using cocaine heavily basically everyday and also smoking weed, using shrooms and taking my xanax which was the one thing I was legally prescribed at the time. ANYWAYS... everything was fun for awhile, party all night, sleep during the day, repeat. Then everything got weird, I started getting really paranoid. I remember having a similar thing happen where all of a sudden people seemed like they were either staring at me with evil looks or wouldn't look at me at all. In my delusional state I thought that maybe I was witnessing the end of the world and that people were choosing sides. The good people were the ones that wouldn't look at me because I wasn't on the good side yet and the evil people were the ones staring at me because they wanted me to join the side of evil. It got weirder and weirder and more intense every day. Everything seemed to have a meaning and be a sign from god or the devil and I felt like I was being told that I needed to choose a side either good or evil because it was the end of the world and the final battle between evil and good was going to happen soon. I started seeing things as patterns and thought people on television or strangers were giving me clues. Like I had my car worked on and the mechanic gave me back my bill and to me it seemed like he was trying to give me a clue and he circled the number of the invoice and the number contained my current address. Or I would see a sentence on an ad like on a napkin from a restaurant and I would think the slogan had a deeper significance and was speaking directly to me. Tons of stuff like that. The other similar thing I had happen is the getting lost in places that shouldn't be easy to get lost in. I remember being lost outside of my friends house. I was on my phone talking to him and he was trying to direct me to his place but I couldn't follow his instructions even though I had been over there a million times.

So yeah I was really messed up. I quit drinking and drugs BUT I keep living in this hallucinatory state for about 6 months after I got sober. So yeah there was like 6 months where I was still seeing shit and thinking the tv was talking to me directly, hearing voices of people I knew who weren't there, or who were dead, thinking everything was a sign from god or the devil, etc. etc. when I was stone cold sober and under the supervision of a friend who took me in and was taking care of me and making sure I cleaned up and didn't wander the streets. And one night I actually did roam the streets in the middle of the winter and I was officially sober but yeah my mind was still messed up. I remember walking through the snow in my friends yard and then thinking the lights on the neighbors houses were making a noise that I should follow. I don't even remember how I got back exactly but I remember wandering and following the sounds I was hearing from peoples porch lights, at the time I was searching for a house I thought I was being led to by god. But I couldn't find it and then I went back. My friend was really freaked out and started locking me in the room I stayed in at night so I wouldn't wander out and end up hurting myself or getting arrested or something.

Seeing all these patterns and connections in random data I later found out is called apophenia. I also found out later that extreme cocaine abuse like I was doing can cause stimulant psychosis http://en.wikipedia.org/wiki/Stimulant_psychosis#Cocaine . Also I've always been more prone to hallucinate than the average person, sleep deprivation, weed, high fevers have all caused me to have hallucinations. So when I added tons of cocaine and booze and drugs to my natural ability to hallucinate easily I believe it caused drug induced schizophrenia.

Moral of the story is yeah I think something is messing with your brain. I had similar feeling of the weird looks and getting lost and feeling like everything was off and like I was in another dimension or another world. My advice is.

- 1 try to find a safe place you can stay with a person you trust who can look out for you.
- 2 if you drink alcohol, coffee, do drugs of any kind stop doing them all now, even coffee, even coca-cola. no drugs, no booze, no caffeine. You don't want unnatural substances messing with your mind while you are in this state.
- 3 SLEEP. Make sure you are getting sleep, even try to sleep more than usual if possible.

4. try to make sure you eat extremely healthy and are getting regular exercise.
 - 5 if you are completely sober, eating extremely healthy, exercising and sleeping properly and you still are feeling crazy then go get on some anti-psychotic meds. BUT please try the natural ways first since most of those meds are a crap shoot and don't necessarily 'cure' you. sometimes they make you worse, sometimes they just mask your problems by numbing you, oftentimes these meds give you more problems but sometimes they are the only choice you have.
- So yeah you aren't in another dimension, your brain is just malfunctioning. Try the sober, sleep, eat healthy, and exercise stuff first and see if there are any improvements, if not then seek out another psychiatrist or psychologist. I'm surprised the psychiatrist didn't lock you up and drug you up after you told him your story. The shrinks I've dealt with in my life always want to push drugs on me. Good luck dude. I eventually fully recovered but there was a time where my friend who was watching me thought I might just stay in that insane waking dream state forever. My situation was drug induced though so it probably has a different cause than yours but I did experience a very similar distorted reality to the one you describe.*

Great comment, really fascinating. A bit better than the usual "...seizure!" :-)

There's maybe a fine line between having a looser perception of things (making useful connections and picking up on things) to just seeing the whole world as a pattern. I mean, it is a pattern, and things are often personally meaningful in a synchronistic way, but not always usefully so - it's the obsession with it to the exclusion of everyday living that makes things go a little too far.

Caffeine is "connection juice" for me. It's only when you stop that you realise how such an everyday boring stimulant has a strong effect on your "reality".

We need an OP update soon.

...

OP?

POST: Dear rGlitch, do Glitches make you happy?

I think they're a tip-off that "things are not as they seem" and that's quite exciting - because they reveal the rules are not as solid and unbendable as we assumed. There's a genuine, deep thrill when these things occur.

Sure, sometime it's scary too - because flexible rules mean less certainty as well as more freedom and possibility. Your response maybe depends on which side you fall. I'd say freedom = happiness.

Whether you interpret glitches as "the brain does strange things" or "reality itself isn't what you thought" doesn't matter: your previous assumptions about your everyday moment-by-moment experience aren't correct. Which might lead to /r/neuro or /r/oneirosophy or somewhere in between, depending on your taste and inclination.

What can be scary though is that, no matter which path you take, it'll turn out that you are not what you assumed you were.

...

Q1: *Stories in this subreddit can almost always be explained by science, but what makes them interesting is that it adds a touch of doubt. It makes you wonder if perhaps something else that we just don't understand is going on. Something we haven't figured out about this universe yet. That level of mystery adds beauty to a world too bland and boring. The world is a magical place when humans are too ignorant to know all of the mysteries around us. As a child, when Santa and the tooth fairy were real, that was magic to you. When someone does a magic trick that you just can't understand yet. The reason religions are so popular.*

Q2: *So, most of the universe? We really don't know jack about much of it, so saying that science can automatically solve everything is a little much.*

Q1: I never said anything remotely close to that.

There are known things in this universe we cannot explain, for instance, quantum physics. We don't know how it works, but it still can be observed. Science isn't the "knowing" of this universe, but the search for what is not known using our observations to better understand what is around us.

What I did imply though, is that we can indeed use science to get an idea of why or how these stories in this subreddit happen. Some times people say they remember something that no one else saw, or even saw something on the edge of sleep.

If we were able to replicate these so called phenomena, we could use scientific method to rule out possible explanations that some people have, like ghost or aliens or whatever.

I honesty think a famous magician on stage isn't actually using actual magic to perform his tricks, but is using illusions to trick us. Having said that, I still ENJOY the idea of not knowing, of wondering, of being in awe and still being subject to very simple bodily senses. I won't jump up on stage and wave the "It's actually science!" flag, because people happen to enjoy his act. It's fun.

This subreddit is fun, and I feel that is one of the reasons why, the possibility of the unknown. I was merely answering your question to the best of my ability.

The problem is the replication, I guess.

Science is great at inferring conceptual frameworks from specific, repeatable observations of regularities or patterns, and reapplying those frameworks more generally. (Much of science is also about the "explanation of explanations".) Most "glitches", though, tend to be one-off life events which occur out of the blue. That's why they're fascinating I suppose - but it also makes them very hard to study.

e.g. "Seizure!" isn't much of an explanation unless you can repeat it, say, but objects appearing and disappearing may point to quirks of our perceptual systems that we might be able to study.

There are definitely certain "commonalities" to the many of the stories here.

POST: [Metax2] The Matrix

It's not really a simulation; that's just an idea your experiencing. In consciousness. Computers, the Internet, AI, their intelligence and wonder is actually just the intelligence and wonder of ourselves, as observers, creators and participants. It is we who give life to information.

You're right, though, that this isn't as it seems. Whether it's the strange nature of subjective experience and its dreamlike ways, or our more esoteric attempts to manipulate it by action or exploration. Something is definitely going on!

POST: Astral Projection

You want to check out /r/astralprojection, /r/outofbody, /r/occult and /r/psychonaut really, rather than glitch. Check out this guide if you're in need of hints. Also recommend the books of Oliver Fox and Robert Monroe.

As to what it's made out of, it's the same stuff as your dreams, as your thoughts, as your body sensations, and as the room around you. Something like this post [Outside: The Dreaming Game] or along these lines perhaps [<https://web.archive.org/web/20150224160123/https://www.scienceandnonduality.com/the-new-science-of-consciousness/>].

/r/psychonaut is pretty good for the philosophical discussion, I find. This subreddit is more about responding to specific stories.

My take is that our ongoing experience is imaginary anyway to some extent (like this), so astral projection is basically viewpoint-shifting within the same information space, or connecting/creating to other dream-spaces, depending on how exactly we approach it.

Q1: I love this. This way of thinking helps a lot with the fear. Think about it: This life/world iS a dream - a dream we've created (as a challenge? like a chess game or ski jump?) with loss, heartbreak, war, illness, death - and also love, fun, laughter, beauty (let's not forget that part!). But IF it's a dream that can cause us to feel we are experiencing very painful and frightening things, then why the hell would viewpoint-shifting to experience a different dream - or the dream from a different "angle" - be "scary"? What can be "scarier" than the ever-present possibility of illness, pain, loss, etc. "here"? Might as well fly and explore!

Seriously, it seems to take a lot of COURAGE and extreme loosening up of nearly ALL beliefs! It seems the known and familiar hut in the valley is not as "scary" as the distant mansion on the hill. :)

Yeah, that mansion eh! :-)

It's scary because it involves letting go, which leads to a feeling of exposure. Beliefs are like "structural tensions", a held pattern through which the sparkles of experience are filtered into familiar shapes, rather than creative avenues. Beliefs control experience, and we know this intuitively. Releasing those tension means you are open to absolutely anything happening. Which makes us feel insecure.

Even doing a simple exercise that involves opening out can be intimidating. For example: Lie on the floor, and give up completely to gravity. Give up all control, let your body and mind and attention unwind and open. Pretty soon, you'll start to feel the openness around you. Pretty soon, you'll feel the 'danger' in the fact that this openness is unstructured, unbounded, and goes on forever. It's like standing a the cliff-edge, overlooking infinity.

We (arbitrarily) identify with aspects of our experience that are unchanging, or change slowly. Primarily, the "sense of viewpoint location" which is a subtle thought, then the "background texture/feeling" that we intuit as ourselves (beliefs, expectations), then regular thoughts, then body sensations then - lastly, because it changes so much - the world/environment. Really, they're all "you", but you bias yourself into thinking you are the most stable of those... and yet we tend to miss the point.

Because of course the most stable isn't an experience at all - it is the background to experience, the background awareness in which experiences arise. That's the only thing that doesn't ever change, so it's the only thing that can be "you".

Metaphysical ramble over. :-)

POST: [deleted by user]

Something a bit like this perhaps?

[QUOTE]

Third Man factor:

The **Third Man factor** or **Third Man syndrome** refers to the reported situations where an unseen presence such as a "spirit" provides comfort or support during traumatic experiences. Sir Ernest Shackleton in his book South, described his belief that an incorporeal being joined him and two others during the final leg of their journey. Shackleton wrote, "during that long and racking march of thirty-six hours over the unnamed mountains and glaciers of South Georgia, it seemed to me often that we were four, not three." His admission resulted in other survivors of extreme hardship coming forward and sharing similar experiences.

Image i - Two mountain climbers:

[END OF QUOTE]

Q1: Kinda? Except that it doesn't happen in any particularly stressful situation, I don't feel any sort of comfort from it, or discomfort for that matter. So it seems a bit similar in the sense that I will randomly feel there's a third person with us.

It stresses the "stress" factor, but actually it's common in other circumstances. More of a "felt presence". Relevant, perhaps:

In a laboratory setting, they were able to evoke such a presence in an epileptic 22- year-old woman, by electrically stimulating part of her brain. Every time they stimulated the left temporo-parietal junction - a part of the brain involved in organising sensory information - the woman turned her head to the side, convinced there was 'someone' there.
-- A renowned and respected scientific publication

POST: What is a glitch?

[POST]

I like this thread, there is a lot of good stories here, some with more truth than others, but nearly all fun to read. But something I think we should remember is what a glitch is. Isn't it an error in the system? Well, if it is an error, might we not be able to utilize it, and try to break the matrix? We should find out what triggered a specific glitch, try to recreate it, find out if there are bugs and hacks also! In the name of this subreddit, we state that the world we live in is Matrix, and glitch-able. Shouldn't we then hack it and escape?

[END OF POST]

Q1: Ummmmm. That might kill everyone.

Q2: If we can hack it, it is a simulation, and therefore not real. So should we not do it because some believe the simulation?

The worry is that you are simulated, your body and thoughts, and you might therefore discover there is no solid background to it, to you.

If each character in the world is like a wave in the ocean, pulling the plug flushes everyone away...

...

A1: I am glad you asked. I felt for a while the impulse to write down my own definition.
A glitch is not just any type of paranormal phenomenon, it is quite the specific one and this subreddit needs the definition, if we want to weed out things that are not glitches. A glitch is an event that, when it happens, seems to show our reality as temporarily "broken", by having us experience situations that are impossible or illogical, while being mundane.
Since reality appears as "broken", the idea of a glitch carries with itself two other ideas, not necessarily mutually exclusive:
a) the idea that our reality is in fact a sophisticated computer simulation, which can occasionally glitch out
b) the idea that there are multiple and slightly different parallel universes through which we accidentally cross, therefore experiencing them at the same time
The following are the most often quoted types of glitches (some of the definitions are mine :o):
1- "hardcore déjà vu": we see a person walking by, we look away, see the same person walking by again... we see or remember things before they happen, etc...
2- "doppelgänger phenomenon": meeting ourselves
3- "alice in wonderland": while in a familiar area, we casually wander into an area that is unknown and seems to be located in another time or another place, we then wander back into familiar territory in an equally casual way
4- "the no-players-map": casually wandering into a familiar area or indoor location that was full of people only to find it temporarily completely empty; said people reappear after re-entering the same location during a timeframe that is too short to allow for the movement of those people
5- "quantum suicide": having a near death experience where we should have died... and probably did but "woke up" in another universe where we did not die. Example: driving and crashing into another car, only to find ourselves driving normally again, in the same split second, as if the crash did not happen.
6- "the disappearing and reappearing object": objects that disappear suddenly in ways that are logically impossible (closed rooms, no other people around, etc.) and that reappear in similarly impossible ways (falling from the ceiling, etc.)
7- "the odd synchronicities": bumping into the same person an impossible amount of times, witnessing the same event too many times to be able to explain it, etc.
8- "the groundhog day": very rare, as in the movie by the same name, people report experiencing the same day over and over again; it might stop at some point and revert to "normal"... or it might not
9- "the missing time": as the definition implies, chunks of time missing from our memory although the people around us seem to remember spending that time with us
10- "the alternate reality": remembering people that suddenly seem to have never existed or, rarer, the opposite, not knowing certain people we are supposed to be familiar with... a particularly widespread version of this has been called "the Mandela effect": it is remembering certain events as different from what they are officially recorded today, i.e. remembering Mandela dying in our childhood instead of when he actually did die, remembering the location of New Zealand as being different from its current location, remembering the "Berenstain Bears" being called the "Berenstein Bears" instead, etc.
This list is by no means complete but it contains all the types of glitch I could think of at the moment.
Comments welcome!

Great summary!

I think that glitches can be generalised as "space and time" anomalies rather than "ghosts and spirits". This allows quite a lot of leeway in the specifics, but gets to the essence I think.

POST: [Meta] A lot of the people here may have glitched into our universe

[POST]

Assuming many of these stories are true, does it make anyone else feel strange that a lot of the folks here may have "glitched into" our universe or plane or what have you? When hearing things like rooms disappearing, people being different and things of the sort, I always consider the possibility that these people glitched into our universe in which these things that they describe never happened or were never there. This could indicate that there is another, very similar version of them in the other universe that may have the opposite glitch story or may just never notice that anything was different. Rather than thinking that something changed within our universe, it is possible that our glitchers have come to an exceedingly similar universe to the one that they came from: the one we all share now. I think that's pretty fuckin' neat.

[END OF POST]

I like.

And some of the stories really do lend themselves better to that interpretation. Or similar: That we are each in our own "extended dreams" but we overlap with other people's dreams for a consensus reality experience. However, when we push things to the limit of consensus reality, or 'glitch', we snap into another consensus that better fits our personal dream aspect. Thing is, we retain our memory trail of the previous consensus, even though it's no longer valid...

Q1: "...that better fits our personal dream aspect."
My lifelong work has become to transform my personal dream aspect for the better.

I think it always happens, if you give up and let go to the flow. But that might be bumpy, since it'll unfold in alignment with your expectations and beliefs - or events will happen to knock those out of you, before your journey continues.

So the thought is: To what extent can we directly update the dream, directly make jumps? This would involve accepting "discontinuities" in our experience though: broken narratives. And it seems that one of the things we hold onto tightest is the "coherent narrative of our days and lives".

When strange things happen, people usually wilfully don't see them - they internally refuse to experience something which conflicts with their world-view - as the stories in this subreddit often indicate.

Q2: A cool idea to ponder. Though, it would imply that parallel universes are separate and independent from each other. Perhaps, the more likely possibility is that they represent a mesh of sorts, where time and space interweave. The nodes of the mesh might be represented by ideas, and consciousness navigates and weaves the mesh-resulting, in our perception, in what we know as reality.

Yes, all possible universes are enfolded into the our environment, with individual moments unfolding one at a time from our currently "selected" universe.

Look around: All universes and possible moments are literally here with you right now, enfolded holographically into the space of the room you are in.

It would take only one small push for you to glitch into another reality...

POST: Brought my bouncy ball to school, pulled it out of my desk, and it was different

Which means... your Mom had changed too. Neither the bouncy ball nor your Mom are the same ones you had before school that morning. Like this story:

I had woken up to find my key chain had turned gray. My boyfriend and I always had identical key chains (actually they were the lock devices that came with our Jeep), and they were both black. When one of us picked up a key ring, we had to look not at the black device but at the collection of keys, because we had the same house, similar cars and other things -- so we had to look to make sure that the gold keys to my office were on the key ring or not in order to determine which set of keys was which. One day, I woke up after a fairl hard night of half sleeping, to discover that my key locking device was now gray. My boyfriend never remembers a time when my key chain wasn't gray, and he insists that a difference in color is the way we always told our otherwise identical key chains apart, which makes me think I also do not have the exact same boyfriend anymore.
-- [Realityshifters.com](#)

Yes, that's what I assumed as well. However, why would only two aspects of reality change (the ball and my mum)?

Because what changed was the bouncy ball, but the whole universe has to be consistent with the new bouncy ball, which includes your Mum's memories. And, therefore, your actual Mum.

Yes, the simplest explanation is that you jump realities, and the reality you jump to is always self-consistent (if one thing changes for you, everyone else will remember it as always having been the "new" way). Or simply that your dream updates and remains self-consistent; whatever "other people" are is neither here nor there. This gets away from the idea of some people being "transported" or whatever. Nobody is transported. Your dream from your perspective changes. That's it. There are an infinite number of possible dreams, and everyone gets to live out their own version of things and their own version of other people.

Unfortunately, there's no one else I could ask about my ball.

They'd remember the new version.

POST: My girlfriend never knew me

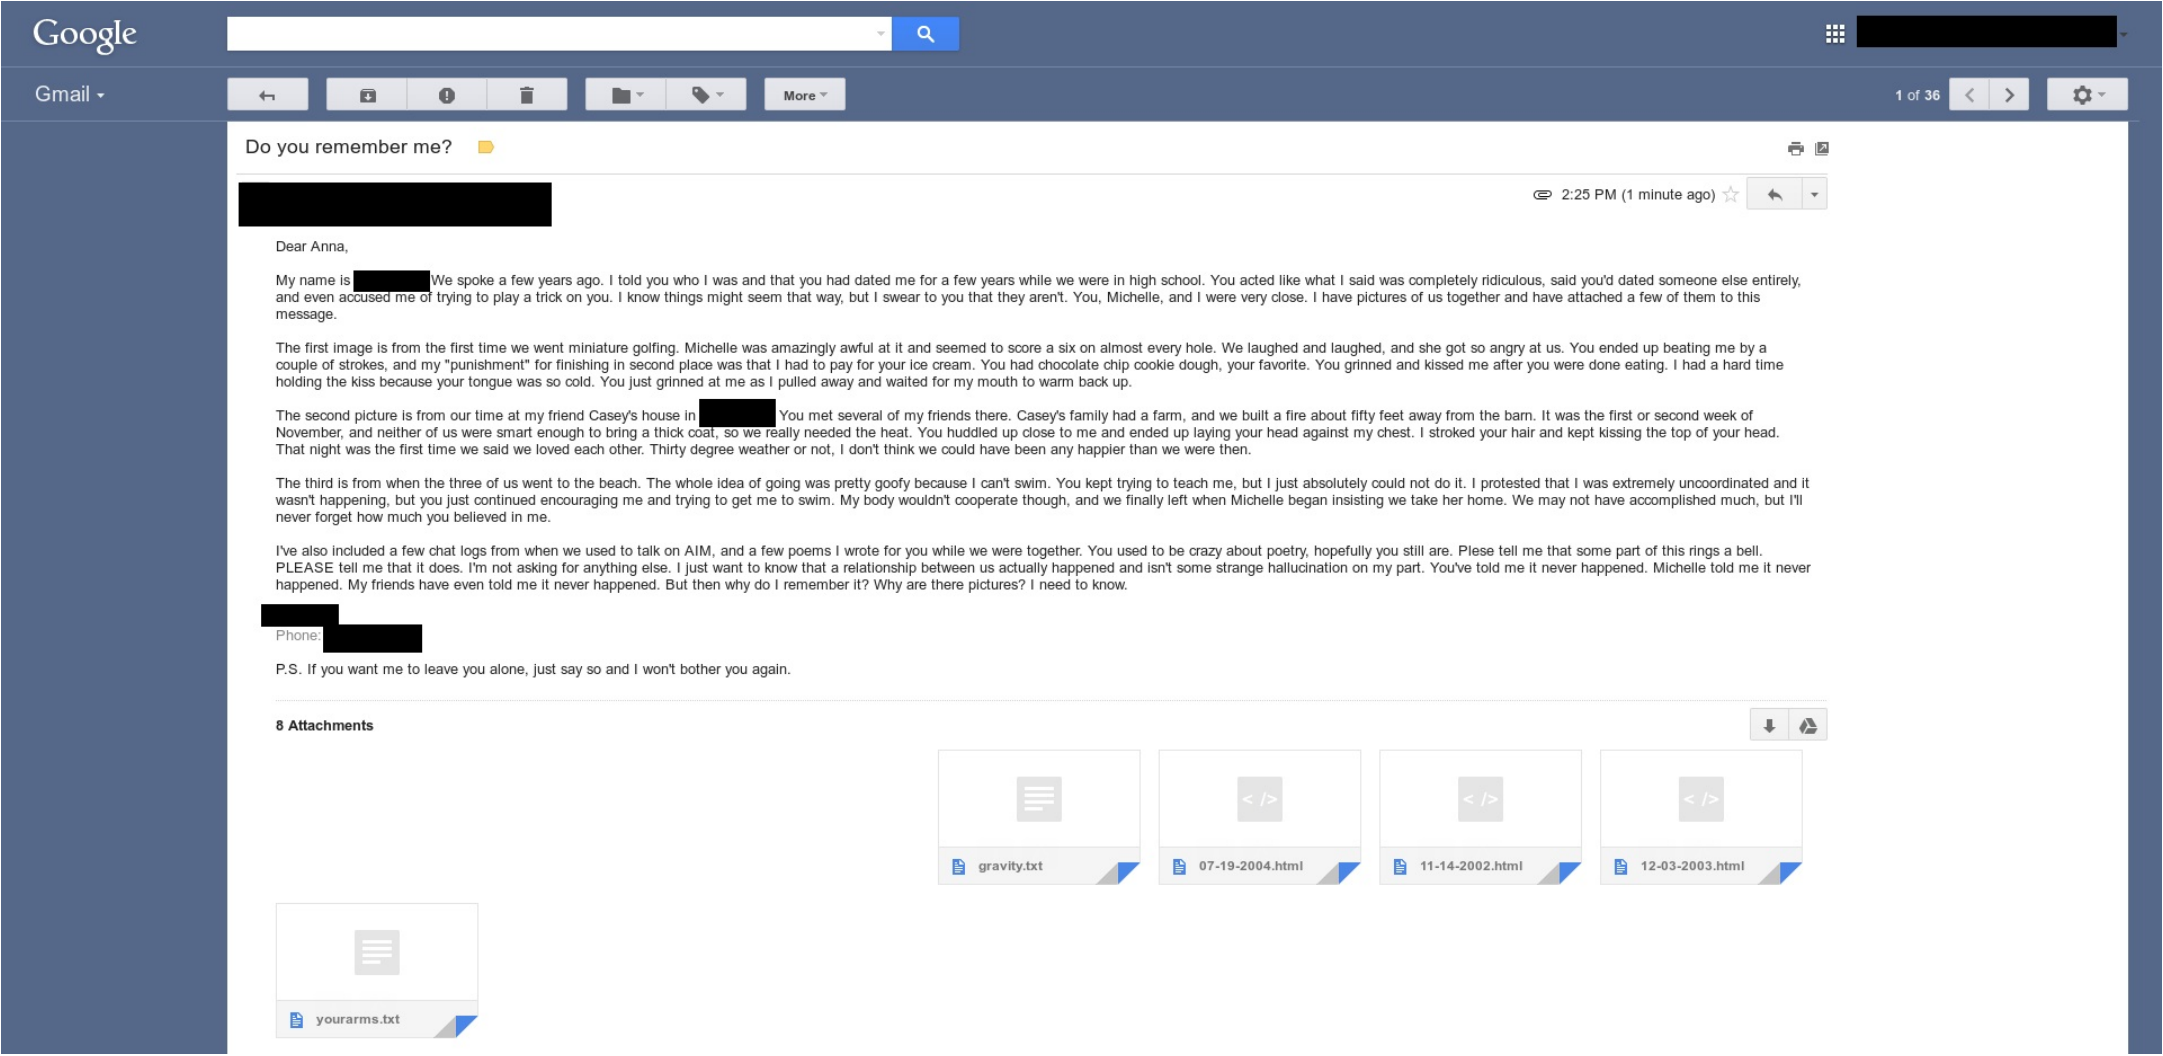

[POST]

About twelve years ago, when I was a teenager, I met two girls. Their names were Michelle and Anna. I met Michelle first and was introduced to Anna through her. We spent a massive amount of time together over the course of several years. Anna and I were actually dating for the majority of that period, and I still have tons of pictures and online chat logs to prove it. Eventually, college came up, Anna moved away, and we split completely amicably. Michelle left for college not long afterward, but things between us were also amicable. We gradually just lost touch. I hadn't really thought about them for a long time, but I ran into Michelle a couple of years ago. I said hello, but she seemed to have absolutely no idea who I was. I told her my name, and she just stared at me completely dumbfounded. At first I thought maybe I had misidentified her, so I asked if she was Michelle [last name] who went to [her high school] and had been friends with Anna [last name]. She stated that she was, but still seemed incredibly confused. I told her a few other things in an effort to jog her memory, but her expression gradually changed to one of absolute terror. She became angry and started yelling, "Who the fuck are you!? Get away from me." With no other options, I left. The meeting with Michelle had really freaked me out. I considered that maybe she had suffered a head injury or something of that sort, but I decided to look up Anna online. I found her, living out of state, and sent her an e-mail. She verified who she was, but also seemed to have absolutely no recollection of me. I gave her my phone number and asked to her call. She did. I tried to make her remember, but she continued acting clueless. I mentioned that I'd dated her for almost three years, but she just laughed at me. "That's ridiculous. I was dating Mike through most of high school!" Who the fuck is Mike, I wondered. She accused me of trying to play a trick on her, and she hung up. The whole situation bothered me for a while, but I managed to let it go. Then, a few months ago, I started going through CD-R backups I had made of old computer data. On one disc were audio recordings from early 2002, recordings I'd created by recording my answering machine messages into a computer microphone. (That might sound weird, but I'm autistic. I have a definite inclination toward saving and categorizing things which feel important to me.) Much of the disc had become corrupt, but two of the messages which remained intact were from girls. Judging by the filenames, one was named Jessica and the other was Heather. Both girls declared that they loved me, but I didn't recognize either of their voices. In fact, I hadn't known anyone with those names since grade school. Yesterday I called up a few people who had been my friends when I was a teen. None of them had any idea who Michelle and Anna were. Neither did they remember Heather, but they all mentioned how I'd spent years absolutely in love with a girl named Jess. Apparently they'd all met her at least briefly, I wouldn't ever shut up about her, and I was absolutely heartbroken when she broke up with me. Nobody recalled her last name, where she went to school, or any details I could use to find her. They were able to give

me a physical description, short and slightly chubby blonde-haired girl, and tell me that she had a squeaky high pitched voice. The girl in my recording does in fact have a voice which fits that description perfectly.

How did I lose Michelle and Anna? How did I gain Jess? Who even is Jess? Has anyone else experienced this kind of thing?

Edit: Several people encouraged me to send an e-mail to Anna about this and include my pictures. I have now done so. Screenshot of the e-mail:

Edit 2: There has been no response. I promise that I will update this post when/if anything changes.

[END OF POST]

Q1: Something similar, but less extreme, happened to me too. I was 16 (12 years ago) and I met a girl from Austria that was doing a high school exchange in my town (in a high school different than mine). Her name was Theresa and she became my girlfriend. She introduced me to some friends of hers, in particular Julia and Mary. The four of us hanged out a lot for 4 or 5 months. After Theresa moved back to Austria I lost contact with all of them, even though it happened I saw Mary randomly a couple of times. 4 years ago (so, 8 years after) I saw Julia on the train and said hello. She had no idea who I was. I mentioned Theresa and Mary, she knew them, but she didn't remember Theresa had a boyfriend. She sounded genuine. She really seemed not to remember me, even though I could mention a lot of places we went to during that Spring/Summer and those sounded familiar to her. I could say where she lived, the name of her sister, and other details that only somebody that spent some time with her could know. She started to feel uncomfortable, she asked me if I have been stalking her or something, and eventually went to another carriage on the train. I was really weirded out by that meeting and her reaction. As soon I got home I looked her up on Fb and we had 4 friends in common. Three were people we probably met in different circumstances (I used to live in a smallish town), while the last one was Mary. Well, I wrote Mary and told her about my weird encounter with Julia. She confirmed we definitely knew each other. I asked her what she thought of what happened, and she said it was definitely weird, but didn't seem like she wanted to investigate further. She told me she hasn't seen or heard from Julia for a while. I searched for Theresa on Fb too, but I even forgot how to spell her German surname, so that didn't help. I looked for pictures of that Spring. Digital cameras were not that common yet, but I managed to find a few pictures of me with Mary and Theresa, and none with Julia. (maybe she took those other pictures? don't remember that) I have never been able to explain to myself how Julia could remove the memory of me.

Interesting. But maybe that Spring/Summer just wasn't that big a deal; she was a periphery character (or rather, you were peripheral in her life). Still, you'd think there'd be some fragment of recall.

Q2: From the voice mail OP posted: [http://vocaroo.com/i/s0zNuzxkAm2n]
Updated transcript: This is what I heard. Updated many of the undecipherable parts in OP's transcript here: [http://pastebin.com/7G6S87QT]
Synthesized Voice: Three saved. Next message. Sent today at 12:29 A.M.
Jess (?): Hey, it's me. -sighs- I called my friends, like nnnnone of them respond. Nobody called me back. I'm calling people that I know, and they don't pick up or I get their answering machines or something. Because everybody else I called they're not picking up; I'm gonna cry. They don't love me enough to talk to me. But you've got a good excuse. You're asleep because you've been hurt and don't feel good. -sighs-
I wish I could take care of you... give you a rub down, full body massage, and make you feel a lot better. And I'll kiss you all over and you'll feel so much better, because everyone knows that my kisses are the best kisses -giggle-. Okay, nobody knows that; that's stupid and that's not true. -giggles- I'm a crappy kisser anyway. Anyway... I can't believe I've called you so many times and you haven't woken up yet! Aren't you supposed to be here with me too?,(indcipherable) you're supposed to be like, "Wow!" -exhale laughing-Idk -pause- I heard a voice and it made me like jump or something, but you're asleep and I can't believe you haven't woken up yet! -sigh and giggle- Oh my God. -sigh- Oh boy. What if I alarm like this? BEEP! BEEP! BEEEEEP! You didn't wake up for shit. (Truly indecipherable), anyway -giggle-
Oh gosh. I'll probably talk to you tomorrow. -sighs- I need to talk to you, technically it's already Monday so hope-full-ee I'll get to talk to you later today. Email me when you get home from school, and if I can I'll call you..and (possibly says "well" instead of "and")..you know -giggle- I wake up, you know, like every hour, every hour!
When I can, I'll call you, okay? I promise. Cross my heart, hope to die, stick a thousand needles in my eyes. I love you. Bye.
*Synthesized Voice: End of message.**

Q3: So...by reading many times this transcription I think we can all agree that seems obvious from the first part of the message that the girl feel like being herself stranger to this world:
"I called my friends, like nnnnone of them respond. Nobody called me back. I'm calling people that I know, and they don't pick up or I get their answering machines or something. Because everybody else I called they're not picking up; I'm gonna cry. "
This could be seen in 3 ways:
1)OP story might check out as himself not having memory of the girl either him or the girl are out of place.
2)OP story could still be true, and the girl just overreacting to her friends not picking up some calls.
3)OP is making up a story, as the "too good to be true" would fit well in this situation.
I mean...How many chances are there that OP could upload this very message?
It kinda looks really suspicious...but maybe coincidence.

Good analysis.

Q4: It's possible that you need medical attention. Speaking for myself, if I found out that my friends remember me being in love with a girl I have no recollection of, I'd schedule an MRI.

Q5: I've actually had an MRI on my brain. I'm epileptic, so it was a necessity to determine that my occasional seizures (which started when I was in my twenties) weren't caused by a tumor or some severe damage to my brain. My brain's fine and Vimpat has kept me seizure free for a long time. I've probably had between 15 and 20 seizures in my lifetime.

Yes, if anyone is wondering, I have experienced short term memory loss after tonic-clonic seizures, which is normal. I've never lost more than a couple of hours, and certainly not details of multiple years. It also wouldn't explain why other people don't remember me.

Edit: And for the sake of making this a more complete medical history . . .

I've never had more than one or two beers in a single sitting, and I haven't drank in years.

I've never used drugs, not even marijuana.

I have experienced clinical depression and social anxiety. I don't have any other mental health conditions.

The only longterm medication I am on is the aforementioned Vimpat. Previous longterm medications were oxcarbazepine and zonisamide, two medications which are also seizure meds.

Reminds me of the guy who went on a ground camping trip, hit his head diving in a pool, and suddenly the girl who he had been getting on with had never been close to him, and the guy who had accompanied him on the walk had never been there, he'd gone home injured on the first day. This is different though - because it seems the other people do exist. And don't remember you at all, not even as a classmate. So, next: Origin of the photographs with Anna, and who is Mike? Plus: school yearbook?

EDIT: Found the story here [POST: The day the world...shifted...].

[POST]

I recently discovered this subreddit via subreddit of the day and was enthralled by all these stories. It reminded me of something that happened to me long ago, something that always stays slightly at the back of my mind. I never thought of it as a Glitch in the Matrix, but this fits so well! The memories of it are still vivid to this day, even though I had also written it all down in my journal a couple weeks after I got home. (that I've used as a refresher for writing this up)

I was 16 and a typical teenage boy. It was the summer of 1993. My parents had sent me to Outward Bound. A month in the outdoors with other "troubled teens" pushing our limits, making us learn trust, etc. In reality, hiking 10 miles a day with 40-60 pounds on your back in the middle of nowhere with other misfits just trying to get through it and back to our lives.

We were in the Three Sisters wilderness of the Oregon back country. Beautiful land. We we're about 2 weeks in to our month long trip. I became close with a girl named Eva in my group (of about 10 girls and boys, and 3 guides, one guy, two women), who was from Sweden. I had been to Sweden a couple years earlier, and we were able to talk about places I visited that she knew. I'll never forget her, I was completely crushed on her. Beautiful blonde, with green eyes. Tan for a swede. The night before this...Incident, she and I kissed, and we made out a little out off by where we camped. We got caught by one of the guides/counselors, and told that relationships (and especially sex) were not allowed. (Something they drilled into us from Day 1. No drugs. No alcohol. No sex - we were just kissing somewhat innocently)

I had also been friends with a guy named Steve. He has got blisters on his ankle the first week, and it got quite infected. The guides wanted him to drop out, go to a doctor, but he soldiered on. We kept it clean and bandaged and even though he had a noticable limp, he managed to keep up with all of us just fine. He talked the guides into thinking it was no big deal and he stayed. He had amazing will power and I kind of looked up to him. He was almost always our group leader.

Now came the weird part. The part where everything changed for me. We were taking a lunch break alongside a gorgeous crystal blue glacial fed pool. There was a minor waterfall (maybe 10 feet) from the stream above feeding it. The water was deep, but absolutely crystal clear and blue. (and COLD! Very refreshing after a hot summer hike) You could see the soft gravel bottom. Five large boulders stood in a perfect circle on the bottom, as if set there by someone. Completely submerged, they were perfectly equidistant from each other. Someone quickly noted that there was just enough room in the center to dive off the waterfall and swim down to the gravelly, beautiful bottom. A couple of the other kids (including Steve, with his injured foot) went and dove. I of course wanted to impress Eva, and she said it looked fun, but was too scared to it. She said she would try it if I did it. My teen ego immediately rose to the challenge. I climbed up the wet rocks next to the waterfall to the top.

I remember looking down at the beautiful crystal blue water. The light filtering through the forest leaves. Eva looking and smiling up at me. It was just a perfect, beautiful day. I jumped.

The next thing I know I'm on the side of the pool coughing up water with two extremely concerned guides nursing over me, and a massive headache. Their telling me I hit my head on one of the boulders. I'm lucky I'm not dead. Steve is no where around. Eva doesn't look a mote concerned, she's off gossiping with one of the other girls. A couple of the other kids are with me, and the male guide helps me up.

The waterfall is there, but the pool is now a murky green/brown. You can barely see the boulders on the bottom. I think I just must have stirred some dirt or something up the waterfall above the fell in. I wasn't thinking clearly. I seem OK (the back of my head hurts, although my forehead is the part that has a minor cut). The third guide (leader) comes up at this point and makes me do some tests. What year is it? Who's the president? What's my name? etc. It's 1993. Clinton is the new president. All is right with the world.

We take an extra long lunch, just to make sure I'm OK. The guides decide I probably just have a minor concussion. They should keep me up all night just to be safe. They decide we're going to hike to a closer, alternate camp, since I might be concussed. If things get worse, they call the rangers. I didn't notice until later, but Steve was not with us. Eva seemed decidedly standoffish, but I didn't get much of a chance to talk to her. The guides wanted to keep me behind them. (One in the back, two in the front).

At camp that night I notice Steve is missing. I freak out thinking we have left him, and tell the guides. The guides quickly calm me down. They tell me Steve hasn't been with us for 4 days. When his foot got infected, they called the rangers and the rangers took him to town. He could barely walk and he's now out of the program and has been sent home. That made no sense to me. I could have sworn he was with us. I remember all 4 days of him hiking with us and his foot getting progressively better everyday. I didn't say anything else, I didn't want them thinking I was crazy. I figured because of my head I misremembered, although it was all so clear. I remembered talking to him at lunch. That night it got weirder. The guides were going to take shifts staying up with me. I asked Eva if she would stay up with me a little bit. She looked at me like I was crazy. And her accent was different. She just laughed at me. The male guide noticed and he said to me that I was one hell of a persistent guy. We talked. He said I'd been after Eva this whole time, and I really should give it up. He was nice about it, but it got through to me that I was being a creep (or at least he thought so) I didn't understand. And he said, it wouldn't work anyway, when she get's back to Brazil you'll never see her again anyway. BRAZIL. Not Sweden. BRAZIL. Eva was from Brazil. This was not true. I thought I must've taken a bigger hit on the head than expected. I just stayed quiet from that moment on. I was so confused. I stayed up all night, thinking of things. And in the morning I felt just fine.

The rest of the trip was uneventful, but everything seemed suddenly slightly different for me from that day on. I've never understood exactly what happened. I suppose it's just the head injury. That makes sense but some part of me just doesn't believe it. My world shifted that day. The memories before that moment are as clear and as easy to recall as what I had for breakfast this morning, or my wife's face. Even after I got back, my parents seemed different. They kept telling me what a changed and different person I was. (Outward Bound is supposed to change you, just not I guess, like that). The whole world seemed different. Computers seemed better over night. Like I didn't remember having such a cool computer, just a shitty one. Everything seemed...different. Video games were more popular and better. The rest of high school I felt like an outsider. I had always fit in before. But as the years passed, I've grew used to it, and grew back to my old (new?) self.

Even though I have a rational explanation (my head injury), I have always doubted. I wonder if the Matrix reprogrammed itself, or I switched consciousness with an alternate me, or some how, through some fluke of the universe, I slipped through into a universe almost, but not quite, the same as the one I came from. I'm late 30's now, happily married, and I still think about that day, and that crystal blue pool.

[END OF POST]

Q6: They say the human mind rather than recalling a memory like a computer, instead re-writes a new every time a recollection is made... so maybe that kind of head trauma might result in the brain's ability to rewrite being severely interfered with, forcing new false memories to be written up based on bits and pieces of information from the old memories.

This is of course speculation.

If perhaps the person who bumps his head also has physical evidence (like say a picture or a video) of said people who no longer either look the same or recognize him... well, that's a whole 'nother ball game. A quite scary one, but a different ballgame nonetheless.

No location in the brain has been found for "memories". My thinking is that, while the ongoing present leaves "traces" as it unfolds, it doesn't leave full memories - they're too big; where would they fit?

Instead, these "traces" are re-interpreted as mental imagery; memories are created on demand whenever you put in a request for one.

Since these memories are created on the fly, to be consistent with whatever traces and other circumstances there are, very small changes would lead to quite drastically different 'histories'; your mind would strive to create a coherent narrative for you as best it could, based on the limited information available.

That's why memories change over time anyway: once you know more about a situation, you tend to 'remember' it with those new facts take into account.

*Q7: So this is a good one. But when I read the post and the thread, I see a few relevant bits of information.

1. You are autistic (high functioning I imagine, but possibly have social issues, any sensory issues?).
 2. You have epilepsy
 3. You were abandoned by your father
 4. You have social anxiety.
 5. You are depressed
 6. You are taking Vimpat, and the drug fact sheet has this to say: "If you develop any unusual or strange thoughts and behavior while taking lacosamide, be sure to discuss it with your doctor. Some changes that have occurred in people taking this medicine are like those seen in people who drink too much alcohol. Other changes might be confusion, worsening of depression, hallucinations (seeing, hearing, or feeling things that are not there), suicidal thoughts, and unusual excitement, nervousness, or irritability."
- In short, before I would consider glitches, I would take a more serious look at neurology.*

I'm going for a fit-based rewire as my main theory at the moment. Brain twitch, trace mangling, then subsequent constructed memories corresponding to the "needs" of the other elements.

POST: The lights went out, but no one noticed.

[POST]

This glitch happened on a beautiful, clear summer evening in 1982. My friends and I were all 17 years old. I was with my best friend, Betty, my boyfriend, Scott, and his best friend Steve. We had not been drinking or doing drugs. It was a Saturday night and we had decided we were going to eat at our favorite local taco place. Now, this place was set up where you ordered and paid at the counter and then someone would bring you your food. So, we'd ordered and after a few minutes the waitress brought our meals. We were talking, laughing and just having a nice time. The eating area was about the size of a McDonald's eating area. There were booths along the walls and tables in the middle. The three walls of the eating area were mostly windows. We were sitting in a booth near the door. Scott and I were facing the counter, while Betty and Steve were sitting across from us. Since it was a Saturday night, the place was fairly busy and there were only a few empty tables. The glitch happened when we were almost done eating. With no warning, the lights turned off and the room was plunged into darkness. Now, as you know, when something like that happens you get a few gasps, someone might let out a small shriek, and people will start asking questions. None of that happened. Betty, Steve, Scott and I all looked at each other in confusion. We looked around the restaurant and everyone acted completely normal. Families were chatting and eating. People were at the counter ordering. The waitresses were bringing out food. One guy got up and wandered into the pitch black bathroom. The cooks were busy cooking in the dark kitchen. A couple came in from outside and placed an order at the counter. After looking around and realizing no one else was reacting, we huddled together and asked each other what was going on. Moonlight was streaming onto our table. Car headlights flashed around the room as cars passed by on the busy road outside. Red lights flashed around the room as a police car sped by. We all watched as a waitress brought food to another table. We briefly discussed getting up to ask her what was going on, but none of us did. We watched as the cashier rang up the new order and the couple seated themselves at a vacant table. We saw a small boy playing with his toy car while his parents ate and talked. And all of this was happening in a room lit only by the moonlight. Unnerved, we decided we'd go up to the counter and ask what happened. Right then, the lights blazed on. We blinked and squinted in the sudden brightness. Everyone else continued uninterrupted. We waited for a few minutes to see if anything else was going to happen, but nothing did. We finally decided to leave. The rest of the night was completely normal and we never experienced anything like that again. TL;DR: In a full restaurant, we were the only ones who saw the lights go out.

[END OF POST]

...

Q1: *[Deleted]*

Q2: *Wow, that's a weird story. I wonder if that's what would have happened if we'd asked another customer (or the waitress) about the light. And you're right, we were regulars- or as regular as our limited incomes allowed :)*

See, for the other story I thought it might be a variation on this [Darkroom Vision & Chef Hats & Dreams] - that what we perceive isn't direct and so maybe goes "wrong", like projected memory or accidental self-hypnosis - but when a bunch of people shared the experience, that's not so explainable!

Q2: *That's exactly what I think. Four of us experienced it. I moved from the area and lost touch with all three of them for a while. In the last few years (thanks to facebook), I've reconnected with the guys (I still haven't found Betty). In different conversations with them, I've brought the subject up again. Both of them agree that it happened. Our memories of the incident are basically the same. What's odd is that we're all still questioning how normal everyone else acted. It was like someone had announced a 'power outage' before we came into the restaurant. The thing is that even the customers who came in later acted completely normal. Ordering and paying for their food in the dark, finding a seat, etc. Not one person acknowledged that the lights were out. It was definitely weird and unsettling.*

It's a great story.

I wonder if "sharing a connection" means we are more likely to share a "localised consensus reality"? Being linked, the group of you had the experience together; others didn't; there was no "really how it was" behind the scenes, everyone was just in their own loosely-connected dream-like states. Or something! :-)

(Other 'glitches' occasionally occur with a couple of people, with nobody else sharing the experience. They end up hypothesising being 'in their own world' or 'jumping universes' for the period, and sometimes beyond. It definitely says something about "how things are really", even if that's not a Matrix-type really. These ones interest me the most - rather than lost keys, dreams, I-fell-asleep-for-a-bit.)

TriumphantGeorge Compendium - Part 23

POST: Dead cousin is coming to dinner tonight.

[POST]

Last night I was on phone with my mom, and she told me to come over for dinner. Everything was going great. Then suddenly she comes out with "Janet is going to be there!" I was like, very funny mom, great one. But in my head I was thinking that's really not funny, why would you say something like that? Then my mom keeps going on with this. "You haven't seen her in forever, it'll be nice, etc."

Janet died last year! I have a vivid memory of it. I did -not- attend the funeral, but I remember everyone talking about it and making a scene of it because she died young. She died of cancer and I remember her husband coming to visit and being very depressed. I never saw her body or anything, but I'm 1000% certain this woman is dead and I remember many family members talking about it.

I never saw the body or visited her grave, and I wasn't that close with her so I never had much grief over it. But I have vivid memories of her dying and my relatives being depressed over it.

I was really weirded out by my mom on the phone, and finally I came out and said "Janet's dead, what are you talking about?" And my mom just kept talking like it was ridiculous or like I was kidding around. She jokingly said "She's back!" or something like that.

I asked my dad later on and he looked at me like I was insane. I also can't find the obituary online (but I never looked for it to begin with).

I'm assuming one of 3 things is happening:

- My parents snapped from grief and are imagining my dead cousin is coming to dinner.
 - I switched universes where Janet never died
 - A zombie is coming to dinner.
- I guess I'll update this post and let you know how it goes? Did anything like this ever happen to someone else?
- I changed the name for paranoia/privacy.
- Edit: I'm finally back, I made a post. Sorry for taking forever.

[END OF POST]

Q1: Okay, sorry for taking so long. I'm finally back. This probably won't be as exciting as you guys were hoping. But it was indeed the same "Janet" I remembered dying last year. I remember getting a really creepy feeling when I walked in and saw her sitting there, but everyone was acting perfectly normal. Nothing extraordinary happened, but we sat around talking for a long time. She talked with me some about finding work. Coincidentally she sat right next to me during the meal. Obviously I wasn't going to come out and say "Hey, I remember you died last year" so I just kind of went with it. I wanted to ask about cancer or get some sort of evidence that I'm not going insane, but it seemed inappropriate. Nobody mentioned cancer or anything out of the ordinary. I like to think I'm a sane individual so I kept my thoughts to myself. Saying I have memories of her dying of cancer isn't exactly polite dinner conversation.

The eerie part is that I was sitting around having dinner with the same people I remember talking about Janet's death with. Some of my aunts were there, and I distinctly remember last year one of them crying over it and being in the same spot. I don't know why but this isn't hitting me as strongly as it should. It doesn't seem profound and I'm not creeped out as I should be anymore. The memories didn't clear up once I saw her, and I still know what I saw/heard a year ago. But it doesn't make me question my sanity or anything. It's just very bizarre. I guess I haven't really absorbed it.

So yes, I did have a lengthy conversation with my "dead" cousin that isn't actually dead. She seems perfectly healthy and in great spirits. I enjoyed talking with her and I'm glad she's still alive!

Q2: There is no way to bring that up organically so I don't blame you.

"Hey, why aren't you dead?"

Q3: There's a 4th option I can see being the likely case: false memory.

I'm no neuro scientist by any means, but the brain is capable of playing tricks on us at any given moment. I see it far more likely that this is the case than you "switching universes".

Have you run all of the information you gave us by your parents? How you vividly remember her dying of cancer and everyone grieving? If not, that should be the first thing you do before assuming this is some kind of glitch.

Q4: False memories/switched universes what is the real difference

Q5: False memory has been proven?

Q6: Yeah, false memory can and has been created under experimental conditions.

Experimental conditions that, coincidentally, are identical to the experimental conditions required to induce universe-switching of the subject.

Q7: Another option is that you had a very vivid dream where she died and your memories actually trace back to your dream. If it was that vivid, then it could possibly be a premonition. You might want to tell Janet to have a check up specifically related to cancer. If you remember what kind of cancer, that might help.

In his book on Premonitions, Larry Dossey, M.D., tells of medical cases where the patients sought such check ups related to dreams. Premonitions often come in the form of dreams more vivid than usual dreams. In one case, a woman dreamed she had breast cancer. The exam by her doctor found nothing. She insisted on a biopsy which discovered the cancer.

I regard premonitions as a form of preventive medicine, because they so often warn us of threats to our health. For instance, one woman reported a dream premonition of a breast cancer before it appeared on breast exam or on a mammogram, when there was no lump or symptom of any kind. She even saw the specific location. A breast biopsy confirmed her premonition, and minor surgery completely cured her.

He gives more details about this story in his more recent book, One Mind.

A woman had a dream that she had breast cancer. Worried sick, she visited her physician the next morning. She pointed with one finger to a specific spot in her upper left breast where she'd seen the cancer in the dream. "It's right here," she said. She could not feel a lump, however, and neither could her physician. A mammogram was done, which was normal. When the physician reassured her that nothing was wrong and that they should take a wait-and-see approach with frequent exams, she was not satisfied. "This was the most vivid dream I've ever had," she protested. "I'm certain I have breast cancer at this exact spot." When she insisted on going further, the physician, against his better judgment, pressured a surgeon to do a biopsy. "But where? There's nothing there," the surgeon objected. "Look, just biopsy where she points," the physician said. In a few days the pathologist called the original doctor with the report. "This is the most microscopic breast cancer I've seen," he said. "You could not have felt it. There would have been no signs or symptoms. How did you find it?", "I didnt," he replied. "She did. In a dream."

Q8: Sounds crazy but if you think about it, it's really not all that off the wall. Your body knows that something is effected, body tells the brain (all this so far is subconsciously), brain tells you in a dream.

Q7: Yes, it seems to make some sense that a premonition dream could work when it's your own body. However, Dossey's books, The Power of Premonitions, and One Mind, provide documentation about cases where dreams lead people to avoid potentially negative outcomes, where it doesn't involve their own body.

For example:

Amanda, a young mother in Washington State, was awakened one night by a horrible dream. She dreamed that the chandelier in the next room had fallen from the ceiling onto her sleeping infant's crib and crushed the baby. In the dream she saw a clock in the baby's room that read 4:35, and that wind and rain were hammering the windows.

Extremely upset, she awakened her husband and told him her dream. He said it was silly and to go back to sleep. But the dream was so frightening that Amanda went into the baby’s room and brought it back to bed with her. Soon she was awakened by a loud crash in the baby’s room. She rushed in to see that the chandelier had fallen and crushed the crib—and that the clock in the room read 4:35, and that wind and rain were howling outside. Her dream premonition was camera-like in detail, including the specific event, the precise time, and even a change in the weather.

Q9: *this just gave me goosebumps...*

Q7: *this just gave me goosebumps...*

I know what you mean. I keep thinking about this story all the time. Either it's a hoax or a fascinating story about the kind of reality we live in. One idea I have about this leads me to the hypothesis that we live our lives in one timeline, but we can communicate in some way with ourselves in another timeline. Dossey doesn't really explore this idea much in his book about premonitions. It's a book mostly about documenting that premonitions frequently happen. Suppose this woman lived out her life in one timeline where her baby died that night. Imagine how she might have felt and all the years she wished that she had not left her baby under the chandelier. Then, she gets a second chance to live her life with her child, because somehow, she managed to communicate with herself across timelines, using the power of premonitions. It's just a hypothesis and I don't know how to go about testing it. The story just seems to have that implication to me.

Or: all time is all at once, and at any point in the timeline you can influence the rest of the time line, from the ground up. Re-seed your reality as it were. As a single pattern.

So, at the point where the baby died, the woman super-intends that it never happened, at which point the timeline is amended in the least invasive way possible - which, obviously, is for her to have an appropriate dream (no material changes need happen in that case) and then make a different decision - to prevent it.

Q7: *So, at the point where the baby died, ...*

I've studied relativity physics enough to buy into the idea that all time is all at once. I don't understand how that idea, or the idea that the woman could re-seed her reality from the ground up, would differ from multiple timelines all happening in parallel dimensions all at once. Talking about "the point" in time where the baby died seems to acknowledge that in at least one timeline the baby actually died. Otherwise, where is that point? If we accept that the baby died in some timeline, then that timeline always exists forever and in that timeline the woman lived the remainder of her life facing the consequences of that tragedy. Even so, other timelines could happen in parallel where the baby doesn't die. I've found the YouTube videos about Imagining the Tenth Dimension [<https://www.youtube.com/watch?v=JkxieS-6WuA>] helpful in thinking about such ideas.

Hi. I've read the book that goes with that, enjoyable. I'd suggest that the notion of timelines is merely a diagrammatic convenience used for explaining things; there's no such thing as branching, etc, really. The alternative formulation - the grid of all possible experiences, which we traverse over time - is the most general, but even that is an abstraction. It is never experienced. Even the other three dimensions are a bit suspect sometimes...

The difference is between multiple timelines and re-seeding/all-time-at-once arises when you think: How do you cross timelines or communicate between timelines? Which woman has her baby die, and which woman has it live? Or is it the same woman? If each woman-version occupies a different timeline, there is no advantage in sending a message back: her baby is already dead. That another, forever-inaccessible baby lives means nothing (and truly, there would be no bridge between these 'timeline universes'; they are not spatially arranged).

"Re-seeding, all-time-at-once" = rewritable, but self-consistent, single apparent timeline*:

Woman's baby dies, she wishes it hadn't, the timeline updates so it didn't, and now the baby always lived, but there was a dream about it dying, which resulted in the action that led to its survival.

Effectively, at the point of wishing, her present moment shifts discontinuously to a new state in which the baby is alive, with a remembered-past now consistent with that outcome - the explanation for her now being beside a crushed crib "accounted for" by the dream and subsequent action that she now remembers in her past.

In effect, you are just changing the present, with a new past memory in it. So even the notion of a single timeline is just a convenience, a mind-construct.

Q7: *even the notion of a single timeline is just a convenience, a mind-construct.*

This seems to imply that either way you look at it in the abstract, looking at it one way or the other only serves as a mind-construct. So, it doesn't seem to make any difference how you look at it. Either way would work just fine as a mind-construct. Yet, we still have to deal with the real world and come to grips with what we think actually happened.

The difference is between multiple timelines and re-seeding/all-time-at-once arises when you think: How do you cross timelines or communicate between timelines? Which woman has her baby die, and which woman has it live? Or is it the same woman? If each woman-version occupies a different timeline, there is no advantage in sending a message back: her baby is already dead. That another, forever-inaccessible baby lives means nothing (and truly, there would be no bridge between these 'timeline universes'; they are not spatially arranged).

I think if you put yourself in the mindset of the woman living with the tragic loss of her baby, she would say that it would make a significant difference to her to know that in a different timeline an alternate version of her rescues the baby. Indeed, the communication of the information across the timelines might depend on just how much she felt that it would make a difference to her. For the communication to happen successfully, it might require a strong sense of importance on both the sending side and the receiving side of the communication. I can imagine that a large number of timelines might exist where she does as her husband suggests, rolls over and goes back to sleep, after having the premonition dream, and then the baby dies. After all, what does she care, it was just a dream, not something important enough to get out of bed. Think about the multiple timeline question, "Is it the same woman?" I think the question has two answers, both yes and no. Up to a certain point in time, the answer is yes. After the woman receives a communication from her future self, then she becomes different in a significant way from the woman who traversed through the same point in clock-time without receiving any such communication. The question is whether that difference amounts to something which should lead us to think of her as a different person or not. People go through life changing experiences all the time where they essentially become a different person. At least that's the way they describe it using words such as, "It changed my life. I became a different person." We might still question that though. When people go through such transitions, do they really become a different person or not? In some ways yes, and in some ways no.

Nice discussion.

This seems to imply that either way you look at it in the abstract, looking at it one way or the other only serves as a mind-construct.

Essentially, yes. It's fine for thinking-about, as it were. When we focus on explaining the real world version, we have to account for a few things.

Let's take "right now" to be the moment of the woman waking up and seeing the crib smashed and the time on the clock. She now has cause to recall the previous events: she remembers having a dream, she remembers moved the baby, she sees the time on the clock. She tries to account for what happened. She thinks...

There's an issue with timelines communicating with each other: If all timelines unfold at the same time, how can the woman in one timeline communicate to the past of another timeline? The moment is already gone in both timelines. Unless both timelines are both "complete" already, in which case it's too late and there's a good timeline and a bad timeline already: one happy woman and one unhappy woman. If they're complete and there is a way of communicating and so one timeline updates another, why not just have a single, self-updating timeline?

I see three ways around this that fit what we know:

1. The woman's intention to save her baby simply updates "right now" and there's no such thing as a timeline really. (No Timeline)
2. The woman's intention updates/rewrites the timeline she is on, sends a dream into the past, which ripples to her present. She updates/reseeds her own timeline. (Single Timeline)
3. The third requires some pondering about what the "woman" is: In regards to the "same person" issue, I'd say that what you are is the "consciousness that experiences your situation", which includes your personality. In other words, your character can change, but you're still you. In this case, perhaps changing timelines is just a case of "refocusing" from your current timeline to another one. Timeline people are "viewports" for experiences, if you like. So in this case, the woman jumps timelines. She detaches from the bad timeline, and refocuses on the good timeline. She is now looking through the eyes of a body whose baby was saved. (Multiple/Infinite Timelines)

What do we actually know, though? That she remembers a dream. That she remembers moving the baby. That the chandelier fell. That the clock time corresponds to the remembered dream. She doesn't remember jumping timelines. Nor does she remember a discontinuity in her experience (reality "shifting"). How things happened seems to always have been how things happened. Her experience of now and remembering the past is self consistent - coherent.

I'd say the version with the minimum "new parts" invented and added to reality is number one: She intended the baby be alive, and reality shifted to have this be the case. This requires that for some reason she would get up and move the baby. The dream narrative works for that. When intending she may even have said to herself I wish I had known about this before, I would have moved the baby, even if I'd had a dream about it beforehand - and reality shifted so that this was the case.

(The problem with "timelines" and "branches" for me is that nobody every experienced them. Where are the timelines stored, where to they take place? How do I get from one to the other? Does the whole universe actually get duplicated every time there's a change? Or is there just an infinite number of universe, covering all possibilities? It's easier surely just to have one, self-consistent universe that takes everything into account, and is updatable. It's just a bit harder to think about or draw diagrams of...)

(Best effort for now.)

Q7: Yes, nice discussion. I like your analysis of the three different ways of thinking about timelines too. Certainly, the more simple perspective is (2), the single timeline. Applying Occam's Razor [https://en.wikipedia.org/wiki/Occam%27s_razor] would seem to make (2) the best choice. However, for whatever reason, I still feel more satisfied with (3), multiple timelines. What do we actually know, though? ... How things happened seems to always have been how things happened. I see this view as a constraint imposed by thinking only about a single timeline. Within the confines of a single universe, we can only experience a single timeline. It's like Flatland.

(The problem with "timelines" and "branches" for me is that nobody every experienced them. We don't have any direct perception of them, but then again we don't have any direct perception of electrons. Perhaps physicists can eventually devise scientific experiments to detect the definite presence of parallel branches. I've seen some discussions about the double slit experiment that point to parallel universes. You may have seen these scientific discussions about the Many Worlds Interpretation of quantum physics too [https://en.wikipedia.org/wiki/Many-worlds_interpretation].

Where are the timelines stored, where to they take place? The same place where a single timeline would happen. I see this question as the same as asking what place the known universe is in. How do I get from one to the other?

Although our brains may have evolved to the level where we naturally have a means to communicate between timelines, that doesn't necessarily mean that we could transport between them. Who knows though, maybe some technology could make that possible, something like on the TV show Sliders [<https://www.youtube.com/watch?v=jdrNNKYBMXM>].

Does the whole universe actually get duplicated every time there's a change? Or is there just an infinite number of universe, covering all possibilities? It could work sort of like how a computer game simulates a world for a user. The game processes the current state of the world, together with the current user input, to generate the next state of the world. The game doesn't have a complete tree of all possible worlds, given all possible user interactions. Then again, maybe the universe doesn't react with conscious minds to form parallel branchings. In that case, the infinite branching view seems to fit better. I think of this as similar to how the physics of the universe has particles interacting with other particles. Only, in the parallel universes some kinds of reactions can happen in ways that allow the particles of the parallel universes to interact with each other. This would then provide the infrastructure by which humans might have the means to communicate across timelines. So, however we might imagine that telepathy might work in a single timeline universe, it might also work across timelines, both forward and backward in time, in a parallel universe.

It's easier surely just to have one, self-consistent universe that takes everything into account, and is updatable. It's just a bit harder to think about or draw diagrams of...) Yes, in some ways it's surely easier with the single timeline. Yet, as you say it's also harder to think about it that way too. Consider how Einstein changed our view of how time passes. That's not a straight forward and easy way to think about time. It's much easier to assume that our human perceptions about time give us an accurate sense about time. That works until you try to resolve experimental issues about measuring the speed of light. That's when relativity becomes the easier way to think about it.

[QUOTE]

Occam's razor:

In philosophy, Occam's razor (also spelled Ockham's razor or Ocham's razor; Latin: novacula Occami) is the problem-solving principle that recommends searching for explanations constructed with the smallest possible set of elements. It is also known as the principle of parsimony or the law of parsimony (Latin: lex parsimoniae). Attributed to William of Ockham, a 14th-century English philosopher and theologian, it is frequently cited as Entia non sunt multiplicanda praeter necessitatem, which translates as "Entities must not be multiplied beyond necessity", although Occam never used these exact words. Popularly, the principle is sometimes paraphrased as "of two competing theories, the simpler explanation of an entity is to be preferred."

Many-worlds interpretation:

The many-worlds interpretation (MWI) is an interpretation of quantum mechanics that asserts that the universal wavefunction is objectively real, and that there is no wave function collapse. This implies that all possible outcomes of quantum measurements are physically realized in different "worlds". The evolution of reality as a whole in MWI is rigidly deterministic:9 and local. Many-worlds is also called the relative state formulation or the Everett interpretation, after physicist Hugh Everett, who first proposed it in 1957.[Bryce DeWitt popularized the formulation and named it many-worlds in the 1970s.

[END OF QUOTE]

EDIT: Whoops, quite long. Sorry.

To expand a bit on the 1-2-3 options

For me, Occam's Razor suggests (1). Although it's harder to think about, it involve less extra parts. When we remember something, we don't "reach into the past" and we don't even have a full memory, we create a memory in the present based on some sort of trace. Often, people who had the same experience differ in their recall. This suggests to me that there is just "now", and as "now" changes, it leaves traces, which are then used to create ("now") an image of a "past" by inference.

Alan Watts had a nice metaphor: the ship and its wake. A ship travels along the ocean, leaving its wake behind it. Would anyone say that the wake causes the ship, causes the movement of the ship? No. In the same way, the past doesn't cause the present, it is a trace left in the present, by the present changing.

For the purpose of thinking though, it's easy to diagram/mentally assemble the idea of a timeline (for straight past-present-future) or branching (to imagine "options" and choices being made). However, we can demonstrate to ourselves that this is just a habit of thought:

Think of a past event. Now point to where that event seems to be. Do the same with an anticipated future event. Now, most people imagine past events to the left, future events to the right, present now, on an imaginary thought-timeline. (In other cultures, they imagine this as back-to-front literally: past to the back of them, future to the front.)

So it's an approach of convenience; we can't find it in our actual experience.

Consider how Einstein changed our view of how time passes. That's not a straight forward and easy way to think about time. It's much easier to assume that our human perceptions about time give us an accurate sense about time.

That's a very good point. How we think about it (above) and how it is - quite counterintuitive (however it is).

Branching and Many-Worlds

I find the Many-Worlds interpretation to be a bit of a clunker myself (even though I find it attractive, in my imagination). It's just a way to try an escape from the probabilistic interpretation of QM. Without a way to actually detect the other universes, it's non-falsifiable, and basically not scientific. It's in the maths, but not in "reality". Whatever that is. :-)

It is a really nice mental picture though. One of the visualisations I had for "jumping realities" went for the grid-of-possibilities notion, which you can read here.

It could work sort of like how a computer game simulates a world for a user. The game processes the current state of the world, together with the current user input, to generate the next state of the world. The game doesn't have a complete tree of all possible worlds, given all possible user interactions.

That's a nice image. It goes quite nicely with the grid-of-possibilities approach too. Ever read /r/Outside? It imagines the world-as-computer-game. Which leads to another possibility...

Shared Dreams and Extended Persons

If what each of us "is", is a consciousness - and a creative consciousness at that - then we can maybe do without having to pre-make universes, or having whole universes create themselves when there's a change, or having grid of possibilities.

If we are "consciousness + beliefs + intentions" then we could propose that each person lives the dream that they want. It is a personal dream, but it also overlaps with other consciousnesses which share your beliefs. When your intentions differ, your dreams will cease to overlap with those whose intentions are counter to yours.

There are no timelines, just lost of "nows", perspectives, intermingled, co-creating.

When the woman discovered her dead baby, she super-intended for it not to happen. Her dream was then updated to take account of that. Since there were hardly any other observers, that wasn't a problem - no counter-intentions. The dream updates for all participants, with a modified trace of the past:

If, however, other people had seen the baby dead, that might change things. We then have these possibilities:

- a) It would not be able to be undone, because of "conceptual momentum" of others who witnessed the vent (the beliefs of others being strong and preventing the chance), or
- b) It would be undone, because nobody would oppose the undoing of this event - no-one is intending against the change, or
- c) The woman's perspective becomes 'de-coherent' and her dream continues with an alive baby, other participants dream continues with a dead baby.
- d) The death of the baby remains a fact.

But this leaves us with one thing to tackle: If the dreams 'de-cohere', become split, what happens to the apparent woman who is left in c) when the dreaming woman has split off? Two options:

- a) We are extended beings, a representation of each of us is present in everyone's dream. All versions. It' just that our "consciousness" only engages with one particular aspect of our extended self. (This gets close to being another version of Many Worlds though.) Better:
- b) Philosophical zombies. It doesn't matter whether a consciousness is "looking through" a person or not. The mind and body will continue 'on automatic' even if no consciousness is experiencing it. It simply will never get re-directed by the 'free will' of the consciousness. It will roll along its present trajectory.

Brains and Timelines

Although our brains may have evolved to the level where we naturally have a means to communicate between timelines, that doesn't necessarily mean that we could transport between them. Who knows though, maybe some technology could make that possible, something like on the TV show Sliders.

Yes, so what we've just done is switch "brains" for "consciousness" and allowed ourselves to effectively gain control over our own "now" - and hence apparent timeline. We don't need to do the jump or communication though, because we always basically choose the version of the world (dream) that we want. It's other people (consciousnesses) which get left with the bad stuff, if they 'de-cohere'. We've moved away a bit from a materialistic view here, but I thought it was worth exploring to see what ideas it added in terms of getting away from a physical branching - maybe going more towards an "informational universe" idea?

Integrated Information Theory is an interesting read at the moment [<https://www.scientificamerican.com/article/a-theory-of-consciousness/>].

...

[QUOTE]

Section 4. Dick's Exegesis of article VALIS:

VALIS has been described as one node of an artificial satellite network originating from the star Sirius in the Canis Major constellation. According to Dick, the Earth satellite used "pink laser beams" to transfer information and project holograms on Earth and to facilitate communication between an extraterrestrial species and humanity. Dick claimed that VALIS used "disinhibiting stimuli" to communicate, using symbols to trigger recollection of intrinsic knowledge through the loss of amnesia, achieving gnosis.

Drawing directly from Platonism and Gnosticism, Dick wrote in his Exegesis: "We appear to be memory coils (DNA carriers capable of experience) in a computer-like thinking system which, although we have correctly recorded and stored thousands of years of experiential information, and each of us possesses somewhat different deposits from all the other life forms, there is a malfunction—a failure—of memory retrieval."

[END OF QUOTE]

QX: I believe it is true dreams reveal things we don't consciously realize, but that it's definitely not a premonition. I know someone who terminated a pregnancy after a great deal of handwringing about whether or not she could manage it unplanned. She had a dream in which the father's dead mother (who she'd never met) spoke to her of about a few things and also told her that she was going to have twins, a boy and a girl. She did end up terminating as I said, and learned that there were two embryos. She mentioned this to her doctor, who said it wasn't uncommon, for patients to sometimes intuit this sort of development. However, it doesn't seem to be a premonition so much as subconscious awareness. For myself, I learned quite traumatically that the person with whom I'd been involved with for years had been concealing something large and troublesome from me. It was not a thing I'd outwardly pick up from our interactions, but I was plagued with constant nightmares that drove my desire to learn more and indeed, my dreams did reflect a truth I'd not consciously realized. I would not call it premonition. I just didn't know I knew. I knew all along.

QZ: I believe it is true dreams reveal things we don't consciously realize, but that it's definitely not a premonition. I understand how your personal experiences and the experiences of your friends, related to how dreams reveal things, provide evidence that supports your belief that dreams reveal things. However, nothing in your comment provides any reasoning for your strongly stated comment ("definitely not") about premonitions. Perhaps you only meant to distinguish between intuition and premonitions. I would agree that the kinds of experiences you described would not necessarily fit in the set of what many people understand by the word 'premonition'. That such kinds of intuition could happen, whether premonitions actually happen or not, seems reasonable. Thus, one might believe in such kinds of intuition and also say that they believe that such intuitions are definitely not the same thing as premonitions. Anyone who has doubts about whether premonitions actually happen, yet would still remain open to any evidence that they do happen, would benefit by reading Larry Dossey's book, The Power of Premonitions, which documents, in a scholarly way, the relevant supporting evidence. The documented evidence demonstrates beyond a reasonable doubt that the distribution of experiences people have of premonitions runs higher than we should expect for chance coincidences. Moreover, the level of detail in the premonitions, in some cases, makes it seem absurd to deny that an actual premonition happened, rather than a coincidental close association between the premonition and the future event. For example, elsewhere in this thread I described a premonition a woman experienced as a dream about a chandelier falling and killing her baby. One could claim that she had an intuition about the danger of the chandelier. Accordingly, her dream could have simply revealed to her what she already knew all along as a subconscious awareness. She might even have seen a weather report predicting a storm at some time before she went to bed. Her dream could have combined the weather report, and her intuition about the dangerous chandelier, and how the storm could cause the chandelier to fall. So, it could all have happened as a coincidence that the chandelier actually did fall on the same night as her dream. However, it becomes absurd to think that she also had a strange kind of intuition that revealed to her that the chandelier would fall precisely at 4:35. Such a level of detail places the dream well beyond the realm of a chance coincidence, and it also puts it beyond the realm of intuition. How could her intuition tell her what time the chandelier would fall? Now, consider for a moment what that minor detail does to the woman who had the dream. She wakes from the dream and tells her husband about the dream. He tells her to go back to sleep, because it's only a dream. That leaves her in the mode of debating with herself whether to consider the dream as a premonition, possibly even an intuition revealing to her conscious mind the danger of the chandelier. As she went through her internal debate, it didn't lead her to rush immediately to rescue the baby. She took the time to discuss it with her husband. Then she faced the detail about the clock, 4:35. She faced an existential decision about whether she believed in premonitions or not, and she only had until 4:35 to make up her mind. Ask yourself, could you go back to sleep if it was you with that minor detail included in your dream? What would you do? Would you wait until morning to change the position of the crib? When she got out of bed to rescue the baby, she acted on her belief that her action could possibly make a difference. In other words she had sufficient belief that she knew about an event that would happen later that morning to lead her to act on that belief. Our beliefs lead us to act upon them. In a dark room, we flip the switch to turn on the lights, because we believe that if we do, then the lights will turn on. If you put yourself in the position of the woman who had the dream, and you have to decide whether you will leave the baby in the crib until after 4:35, and you can honestly say that you would leave your baby there so that you can wait until morning to move the crib, then I would accept that you don't believe in premonitions. On the other hand, if you would get up to rescue the baby, then I would say that you do believe in premonitions. Some things lend themselves to scientific investigation better than others. Dreams fall in the realm of something difficult to analyze with experiments. We have some results, but it remains a relatively young science. Likewise with premonitions. Although, what most people would call a premonition happens fairly frequently. It's not something that happens in a way convenient for scientific investigation, like the motion of the planets, or earthquakes. That does not mean that we shouldn't believe that premonitions happen, simply because science hasn't given us conclusive evidence yet.

Surely the difference between intuition and premonition is just the time at which the 'fact' is true. Intuitions are about "facts now", premonitions are about "facts later"... but they must still involve "facts now"?

The chandelier case involves "facts now": additional knowledge about now: that she sensed now that the chandelier was unsafe, and even when it would "fail". That information was available "in the universe", at that time.

Effectively, it's still intuition, but not restricted to body-based-information intuition?

Some things lend themselves to scientific investigation better than others.

True. One-off life events can't be studied under lab conditions. There is no regularity or repeatability, and they are rarely of the same 'nature' between instances. I doubt we'll ever really be able to study premonitions of this type beyond anecdote collection.

QZ: That information was available "in the universe", at that time. I like this idea about information available in the universe. With respect to the woman's premonition story, I wonder if she didn't act or think in some way after her baby died which assisted her own access to that information at the point in time where she had the premonition. With all of the information available in the universe, her dream focused precisely on the information that would help her to save her baby. I also like the idea of thinking about intuitions and premonitions as essentially the same. I've never thought about it that way. That seems helpful. People in general tend to accept that intuitions happen, even though we can't explain how they happen. Yet, many people can't accept that premonitions happen. I think notions about the arrow of time prevent people from accepting that premonitions really happen.

Good point about the 'arrow of time'. But if all information's available, all time is now, effectively. (Neville Goddard has a nice line in one of his books: Everything is deterministic, except when you make a change via intention, at which point you shift the direction, and it plays out deterministically again from that point, in that direction. So everything can be known of past and future, except for the changes brought about by this creative interference.)

Also: see my other, clumsy comment on timelines elsewhere in this thread, describing the intention. You only ever need to change now. We just often have a bit of a bias against dramatic discontinuities taking place as explanations - but it's an easier explanation than "multiple timelines" actually. There's one unfolding experience, but all moments contribute to the entirety, which is effectively an updating of "now".

(She doesn't need to have actually had the dream at the time, she just needs to end up stood beside a broken crib, holding an alive baby, and having a memory of a dream and of getting up that accounts for and is consistent with her "current present moment". How could you tell the difference? Your whole reality could change right at this minute: you could turn into a Belgian sailor, and as long as when you looked for a memory you got a consistent one, you'd be okay with that. Sailor.)

POST: Bone.

[POST]

This happened like, literally 5 seconds ago. I'm sitting in my bedroom on reddit when my dog walks in and picks up his bone and walks away. Pretty normal, right? WRONG. My dog has only one bone. He already ate it like 10 minutes ago. Now he's chewing on one in the living room, that didn't exist previously. Only explanation: My dog IS the glitch.

[END OF POST]

AI: Quantum Bone Immortality.

And your cat can teleport.

What? You don't have a cat? Exactly. It teleported even before you got it. That's how smart they are.

POST: Physicist's theory on interacting parallel universes

[POST]

Just sharing his theory all laid out [<https://www.iflscience.com/physicist-predicts-parallel-universes-overlap-and-interact-26184>].

[END OF POST]

Q1: I just find this concept too mind-boggling to fully appreciate. It's one thing to talk about all time existing at the same time. It's another to now hypothesize that a universe exists for every single probability imaginable. Just imagine how big this universe is in and of itself. And then to think that every single scenario possible can take place or rather is taking place at the same time, and in the same space? It's just too much. Just the probable scenarios that could take place on one planet alone like Earth would be astronomical.

See here for an alternative formulation (in the comments). Configuration spaces! Like Julian Barbour's Platonia idea: [[http://en.wikipedia.org/wiki/Platonia_\(philosophy\)](http://en.wikipedia.org/wiki/Platonia_(philosophy))].

A further point: The universes wouldn't be in "space" really; it's not like they are in a storage facility. Each possibility isn't discrete, just like each frequency in the spectrum isn't discrete.

But... all this, is just nonsense. :-/ It comes out of that maths, it just a way of accounting for the different probabilities. But these probabilities don't need to "exist" anywhere; only one outcome is ever observed. Alternative formulations - e.g. David Bohm and de Broglie and BJ Hiley - give us a deterministic version of quantum mechanics (the environment becomes the observer, so there is no collapsing of the wave function), so only one universe.

I do think that this universe is quite... flexible though. Probably go for idealism rather than materialism (idealism: consciousness is fundamental) to get the Matrix effect, I'd say.

One universe, but perhaps many possible dreams...

POST: Automatic reaction

[POST]

This happened not too long ago, It was my sophomore year of college and I had just got done cooking myself some pasta and sauce in my small apartment kitchen. So fast forward to me cleaning up and putting everything away, I just got done putting away the pasta box and all the other things I'd taken out of my pantry and put my focus and attention on the dishes. My kitchen is super small, when you walk in the sink is directly ahead, fridge to the right, and a row of cabinets to the top left above the stove and oven with about a 3 foot gap between counter tops. So as I was doing the dishes, I get this feeling in my arms like they're slowly becoming numb and I'm no longer controlling them, they're just kind of moving on their own. This is not an exaggeration to try and make whoever reads this more impressed, my arms were moving so fast and I was cleaning dishes with such precision and efficiency that I was convinced someone had drugged me or put coke in my food or something, I had no explanation at the time, but I could not stop my arms from doing the dishes, it was like I was watching somebody else do them through their eyes. Then all the sudden my body turns incredibly fast to my left with my left arm out and i catch a box of noodles that was all ready half way out of the pantry falling to the ground. I was not consciously aware that they were falling, I did not hear the box fall from the pantry nor did i see it. After that happened my arms regained control, I stayed up that night, the whole night... just trying to give myself an explanation on what just happened. Never told a soul until right now.

[END OF POST]

This is actually pretty normal. There's a technique for being good at catching/hitting stuff:

- Centre your awareness in your forehead area.
- Keep out of the rest of your body.
- Have a friend throw a ball at you.
- You will catch it super-fast and automatically, in a "creepy" way.

The feeling is very much that "your body is moving by itself". Thing is, though, that is what's happening quite a lot of the time; you're just not paying attention. (When you do pay attention, you'll tend to 'hold on' and create the feeling of 'doing'.)

Q1: When my mother was once explaining this technique to me, related to fencing, she called this state of mind/body "grocking." I do not know if that is French or English nor what, that is how the word sounded.

Q2: "Grok" is a made-up verb from a novel called "Stranger in a Strange Land" by Robert Heinlein. When I was in high school in the 60s-70s, everyone and their mother-in-law was reading it. "Grok" refers to a special, deep, intuitive kind of understanding, if I recall.

[QUOTE]

Grok:
Grok /'grok/ is a word coined by Robert A. Heinlein for his 1961 science-fiction novel, Stranger in a Strange Land, where it is defined as follows:
Grok means to understand so thoroughly that the observer becomes a part of the observed—to merge, blend, intermarry, lose identity in group experience. It means almost everything that we mean by religion, philosophy, and science—and it means as little to us (because of our Earthling assumptions) as color means to a blind man. The Oxford English Dictionary defines to grok as "to understand intuitively or by empathy; to establish rapport with" and "to empathize or communicate sympathetically (with); also, to experience enjoyment".

[END OF QUOTE]

POST: Tamagotchi Dream

[POST]

When I was a kid, in the 4th grade, I believe, Tamagotchi had just come to the U.S. and was hugely popular. Like every other kid, I really really wanted one. There was one night where I had a dream that I was going into my house after coming home from school, only to find a purple Tamagotchi sitting on the dining room table. In this dream, my mom said she would have gotten me one that was a different color, but that was all they had left. Before I could respond, I woke up from the dream. Low and behold, next day, I'm coming home from school, same outfit as in the dream (which I didn't notice until after the fact), and guess what's sitting on the table: the purple Tamagotchi. As I open it, my mom walks in the room at the same time as in the dream and says the same exact thing. In this ending though, I gave her a big hug and said "THANK YOU!!!"

[END OF POST]

Yeah, I used to always have intuition/knowledge about presents. One time I was going to the States as a treat for my birthday (I'm UK based). One day in the week before, my girlfriend came in the room and I just "knew" what present I was going to get (an electronic device of the time). Sure enough, on holiday visiting our friend, that's what I got.

Similarly, I'd know when it changed. My parents got me a games console when I was a kid, but it didn't work so they had to take it back, and got me some Star Wars stuff instead. Thing is: I "knew" I was getting the console, and then I "knew" I wasn't, before Christmas day.

(In other words, it's not precog, more 'extended awareness' or something. Also, I am plainly selfish and all-about-me!)

Extended awareness, eh? Sounds interesting. Good to know I'm not the only one!

I think it's probably something you can get good at, with practice. I've not really deliberately tried though. Maybe this December eh! :-)

POST: Seeing dark figures.

[POST]

Not sure how else to describe this. Over the last 3 months or so, I keep noticing things out of the corner of my eye. The first few months I shrugged it off as my brain just acting up in strange ways, but it keeps happening. Lately, it's been a bit more detailed in nature. Just last night I was driving home and saw a dark figure seemingly run across the street. It was dusk, but no other car was around me and when I looked at the other side of the road no one was there. Just a few days before that, I saw a similar figure standing on the sidewalk as I drove by. It's beginning to kind of get to me, thinking about seeing a psychic or something along those lines just to see if they mention anything. Which is a really strange thing for me to be sitting here typing as I am not the kind of person who thinks psychics are real or paranormal activity is going on.

[END OF POST]

Mostly in the dark? Peripheral vision? [\[http://en.m.wikipedia.org/wiki/Visual_release_hallucinations\]](http://en.m.wikipedia.org/wiki/Visual_release_hallucinations)

[QUOTE]

Visual release hallucinations

Visual release hallucinations, also known as Charles Bonnet syndrome or CBS, are a type of psychophysical visual disturbance in which a person with partial or severe blindness experiences visual hallucinations.

[END OF QUOTE]

Q: No they mainly happen during the day or towards sunset. At night I typically don't notice it at all. I work in a brightly lit fluorescent room and it happens there too. Also, I'm not partially or severely blind.

Just suggested it for the glaucoma thing, which would mean getting it checked soon as. It can start with minor "errors" like that, that build. Do you get any weird "distance" effects? Look up Alice in Wonderland Syndrome.

Otherwise: Stalked By Evil!

Q: God damn, I hope it's not glaucoma. I'm only 27. I mean, no strange distance effects really. I wear contacts and get a regular check up from the optometrist. Last time I went he said my eyes actually slightly improved.

Probably isn't, but get it checked anyway eh? If you'd always seen stuff or if it was a one-off, different, but... And I assume you haven't recently started meditation/cotter practices?

What are cotter practices? I do meditate, but that has been an on going thing for the last 5 years or so. I mean, this really started kind of out of the blue. At first I did think it was hallucinations of some sort, but now I just don't know.

Other! :-)

Hmm. Keep an eye out. So to speak. And update above with other developments.

POST: I put tinfoil in a microwave and it cooked normally

So long as it doesn't have edges and is in contact, it can be fine.

From Physics Forums:

Q: I recently purchased a new microwave oven, and there's a metal rack in it. The salesmen informed me that it shouldn't cause any problems as long as it didn't touch the sides; however, he was unable to tell me why this is. I have a basic understanding of how microwaves(as in the radiation not the ovens) interact with polar molecules causing heat and how they interact with delocalized electrons, and I can't think of an explanation as to why not touching the sides would prevent this interaction from occurring. Well, that's a lie; a more accurate statement would be that I cannot think of a satisfactory explanation. Any thoughts?

A: I cannot think of any problems if it touches the sides of the chamber, I would think that the shelf spans nearly the width of the chamber already and is just separated by a few centimeters of holding brackets (if even).

A microwave is a resonant chamber, the chamber is enclosed by good conductors like metal. The main problem with metals in a microwave is that the electromagnetic waves in the oven induce currents and charge localizations in (and mostly on) conductive objects. Objects with sharp points create an effect known as field enhancement because the density of currents and charges at a point is very high despite the actual magnitude being low. The field enhancement can cause the air to breakdown allowing sparks to occur. But a rounded metal object is usually ok which is why you can place the rack in the oven and I cannot imagine any real problems of the rack coming into contact with the walls that wouldn't occur already by just having it in close proximity to the walls.

-- Physics Forums

POST: Apparently somebody hit rewind

[POST]

Husband and I were coming home from dinner with friends tonight. He turned onto the road that eventually leads to our house; it starts out making a large S-shaped curve before going straight for a few miles. We went through the first curve and were partway through the second when I looked to the side out my window for a moment, then looked back... and we were just heading into the first curve again. As I realized that, I had a brief moment of dizziness like you get when you've been moving fast and

suddenly stop. It only lasted for a second or two and then cleared.
I turned to my husband and said, "Wow, that was weird!" and proceeded to tell him about it. He hadn't noticed it himself, so apparently it was just me. Not as interesting as some stories here, but it was an interesting sensation for sure.

[END OF POST]

Given my post the other day, how much do we think our experiences might be almost entirely mind-generated, based on only very minimal hints from the senses?

Things like this, maybe you're basically in 'dream mode' and it's only if you suddenly pay attention that you're forced to 'reset' to match what's actually going on. Mostly, it just passes unnoticed that you're inventing/assuming the experience in the background to your journey, etc.

Q1: Ultimately, our entire consciousness is essentially just the brain making sense and forming patterns out of the millions of data points streaming at us all the time from our surroundings. It's definitely not a perfect process and can be easily perturbed and influenced by a huge number of factors that challenge the brain's effectiveness at stitching reality together reliably.
My guess at what happened here is OP was sat in the car not really focussing on the journey. They go through an S bend somewhere (or something that feels like one) and she assumes they're nearly home. Then they drive on a bit and eventually actually get to the real S bend that leads to their home.
The key thing here is that the perception of what happened is perfectly legitimate - OP felt like she somehow lived through the same moment twice. However, it's vanishingly unlikely that this actually hapoened, with a mundane explanation most probable. Similarly, déjà vu feels incredibly odd and real despite the fact that it is, in all likelihood, an illusion of the brain and not genuine reliving.
I find it important to recognise this as people can often feel belittled and sleighted if they are presented with a more likely alternate explanation for their paranormal/matrix glitch experience. Really though they should feel safe in the knowledge that their sensation and experience was genuine even if the event they believe happened was illusory.

The key thing here is that the perception of what happened is perfectly legitimate

Yes, this is important. People actually do experience what they experience, literally. They are not mistaken in this regard, and didn't imagine it. They really experience it - - - however, if your experience is generated from minor clues and expanded into 'experience' by background knowledge/thoughts, then sometimes we can go quite far adrift.

This isn't to say that some 'weird stuff' doesn't go on: I think it does. However, the nature of the underlying reality (if there is such a thing) might be so different in its form from what we actually see around us, and the level of inference so high, that navigating the world requires an ongoing 'fake narrative' that inevitably goes astray sometimes, and then we see that we 'make up' most of the world.

POST: Lost An Hour Of Time...

Q1: daylight savings time baffles me also

20 years ago, even if all the clocks were digital, they wouldn't have auto-adjusted? Even computers used to require manual changing I think, because they'd be running Windows 3.1? From a website:

I honestly don't remember Windows 3.1 even offering the feature to make the clock change. I don't even think it ever acknowledged timezones. (A program called 'Tardis' was used to set the network time for Windows machines instead.)

But to check... where does OP live? When did this happen? In the EU summer time begins at 1am so the jump would be from 1am>2am. In most of the US, this happens at 2am>3am.

Wouldn't explain the CD though. And if they were thinking so hard about it, surely they would have come up with that solution?

I live in the eastern US, and I don't remember precisely when this happened other than that we were on summer vacation from school. So that would put the event sometime in June, July or August. And even if it did occur in April or October when the clocks are adjusted for daylight savings, I can definitely say that this was before the time of self-adjusting clocks. And even if we did have self-adjusting clocks, the time is either adjusted forward one hours from 2am to 3am, or backward one hour from 2am to 1am - neither of which would explain a change from 1am to 2am.

What I figured. So, go crazy: What's your best theory on this?

Q2: We're making every single bit of it up, and trying to figure out how to make it up BETTER - which we actually already know, but the whole point it to see that we know. We're trying to wake ourselves up with all these "glitches". That's the best I've got at this very moment, otherwise, I'm all out. (btw, I'm a big talker, but it's very challenging to "do".)

Our attempt to wake ourselves up, I like. My best attempt so far is here. The 'game' part is a joke, but the manner in which experience is created, not necessarily.

Q2: (Re: r/Outside - Thank God I'm sorta old and the only computer games I've really played were Myst in the early 90s, and Farmville! I say "Thank God" because I know how addicting they can be.) I liked your comment about players sometimes "losing track", being in an "off-state", etc. In my experience, a regular practice of meditation, a very serious trauma or "falling in love" result in a tremendous increase in "glitches". Anyone else experience this?

Yeah, /r/Outside is a nice satire about how immersive/addicting they can be. I did a bit of Myst and Tome Raider but then mostly let it go. I enjoyed The Last of Us though. All of these have a defined end-point, however! (I guess /r/Outside does too, but it's more... final.)

Meditation, lucid dreaming, or any hard-thinking about the nature of things seems to shift things and bring out the synchronicities and quirks. My other post here showing how 'indirect' and created our perception is, I guess, suggestive of just how flexible things might be. Donald Hoffman has an idea that what we experience is like a 'user interface' for our world, based on utility rather than accurate representation - so perhaps when we change our 'goals' our representations adjust accordingly, to be more useful for that aim...

POST: What would you guys call these... flashes of consciousness?

Everyone's gonna say "absence seizure!", but -

Is it like suddenly "waking up" and being self-consciously aware of yourself and what you're doing?

Yes, almost exactly so.

You're just "coming to". It's something you can practice. Actually, some people do this deliberately: "pretend you just 'appeared' here right now" as an exercise.

Hint: Next time you wash the dishes or tidy up or whatever, trying keeping your attention centred - but not focused - where your prefrontal lobes would be: behind the eyes a bit and up. Imagine you are "looking out from there". This helps you stay "here". See if you can stay "present" throughout the task.

That sounds kind of odd, not gonna lie, but I might give it a try next time.

Yeah it does a bit! It's just a trick for mindfulness. It just keeps your attention from drifting and getting lost in random thoughts, but also stops it super-focusing and getting lost in what you're doing. It should feel the same as that "being awake" feeling, especially if you make sure you take your time with whatever it is you're doing and don't try to rush it, and kind of relaxed.

Give it a go.

...

Q1: Something similar happens to me, too. I think "Why do I see and feel through this body? Why can't I leave and see the world through another person?" But I guess all the bodies need one "conscience" to "pilot" them, and that's why I can't leave. (Why can't we switch places with someone else, though?) Sometimes (it happens less frequently now) I have this feeling of coming back to reality and I'm like "Oh no, I spent too much time without really feeling!"

Q2: (Why can't we switch places with someone else, though?) Oh god, that'd be nice. If you ever get sick of yourself, just change over with a willing participant, kind of like a "body vacation" type thing.

Can't find the quote, but I remember the non-duality author Frances Lucille has a book called The Perfume of Silence, and in it someone asks him: why can't I see from your perspective or become another person, if we are all just 'fragments' of the same consciousness? He replies that you could, but it's just that you don't truly believe that you can. In a way, if our bodies are just part of the overall 'environment' and we are 'awareness' looking through them, there's no reason why we can't look out from another perspective really. How you'd go about "doing" that, I dunno. By willpower alone?

I fancy re-perspectivizing to someone in the Bahamas for a bit.

...Yeah, yeah - but if you do this, then you are them! Instead of "you" looking through "SubDee54's body", you'll be looking through "Bahamas guy's body"! I'm gonna practice this weekend, definitely. Hey, if you feel a funny sense of 'displacement' over Sat/Sun, it's just me practicing, okay? :-)

EDIT: Found the quote:

Q: If what you say is true, then I should be able to change places with you, but I don't think that would work!
A: It wouldn't work simply because you think it wouldn't work. What makes this perspective seem unlikely is our assumption that consciousness is personal. This complicates everything because, obviously, a personal consciousness could not possibly be that which creates and contains the totality. When we say that everything is contained in consciousness at every moment, it seems impossible only because we perceive consciousness as personal.
-- The Perfume of Silence, Frances Lucille

So, um, make of that what you will! :-)

Q: ... [<https://www.youtube.com/watch?v=0L89MTQjvZ0>]

Yeah, exactly.

I still love the idea though.

POST: Extreme Déjà vu?

[POST]

So the other day I was playing Destiny with a new friend I had made. We were running around doing some item farming. (basically collecting items to upgrade gear.) I had met this friend earlier that day, and we had been playing together all day. All of a sudden while playing the game, everything started to seem familiar, like I had been here before. Not in the game, but every action my friend was making, every scene, every camera angle seemed perfect to my memory. I stood still, trying to figure out what was going on and break free from this "memory", only to realize that even the scene of me standing perfectly still in that exact spot was in my memory. My friend was talking to me, but I wasn't paying much attention, as I already knew what he was going to say. I probably spent around a minute wandering around as I memorized each and every move I made, and every sentence my friend was going to say. After that, I promptly told him about it and what I was feeling/seeing, and he just called me crazy. After I told him it was back to normal. This memory was not only from before I met my friend, but before the game had ever been created and released. This memory was from months, maybe even years ago. I'm not too sure if I would consider this a glitch, but it was definitely one of the weirdest things to ever happen to me.
edit: words

[END OF POST]

...with a new friend I had made

Literally?

Sounds like you should have programmed him with some better AI! ;-)

All of a sudden while playing the game, everything started to seem familiar, like I had been here before.

Yeah, I had heard that Destiny was repetitive, smaller than anticipated, and disappointing. I just didn't realise it was on the level of actual reality - not only didn't they program enough landscape and challenges, they actually rely on déjà-vu-ing the memories of the players to fill in the gaps. Cheeky!

Q1: Haha. I had no expectations coming into the game because I hadn't even heard of the game until it was already out. Its a pretty great game though, the only people who truly dislike it were expecting Halo 5 renamed Destiny. Needless to say this experience was still rather odd.

All true. I can't wait to hear what glitches you get with No Man's Sky when it eventually comes out...

POST: I don't even know what to say.

[POST]

This just hit me, and it's something that's been going on for years. Sometimes, very randomly, and in any state of mind, sleepy, wide awake, day dreaming, or anything at all, but most common and weird when I'm wide awake. Sometimes when I blink or close my eyes I see very vividly an odd variation of where I am. When this occurs, it feels as though I close my eyes, but another set opens? I can't describe it, but that comes pretty close to the feeling. Some of the most memorable moments were just last year.

1: I was sitting in class and I looked out the window, and I blinked and saw a weird spin on the room. The scenery was altered a little bit, and the room was set up differently, more desks, windows in a different place, kids I don't remember sitting in places they weren't just a second before. This all happened in just the fraction of a second when I blinked. I closed my eyes to see what was going on, but I was facing a wall this time. I saw through the wall I guess, out into a city I didn't recognize with a backdrop of mountains I had seen before, but didn't remember where. When I opened my eyes it had only been a second or two. It wasn't a dream because I knew exactly what was going on when my eyes were closed and I wasn't tired at all.

2: I was taking a mid afternoon shower and closed my eyes to enjoy some hot water on my face, but I saw a different bathroom. I felt water hitting my face but I couldn't see it. It was a completely different bathroom with a window looking out to a similar city as noted in number one. I could hear my music playing and was very conscious of my body and what I was feeling, but I saw a different place with my eyes closed. When I opened my eyes everything was exactly what it was like before. My bathroom, same song playing, and not much time passed at all.

3: I was in bed watching a movie and closed my eyes, and saw a different room. Same scenery as 1 and 2, but not my city. I looked around the room and it was not my room at all, some place I had never seen before. It was very disorienting. I went outside to gather my thoughts and closed my eyes to try to calm down, but, and I bet you can guess it, this was not my yard anymore.

These are just three instances of this weird phenomenon that happens regularly. I thought it may have been microsleep episodes from sleep deprivation, but I'll experience this after getting a good nights sleep and I feel well rested. Another thing that may rule this out is that I will get these "hallucinations" during strenuous activity as well as monotonous day to day activities and have never posed a threat as I can open my eyes at any time and everything is normal again. I'm not going to rule it out, as it seems logical from an outside standpoint.

[END OF POST]

"Hello to Jason Isaacs!"

Q: I have to check that out now, thank you very much. Maybe next time it happens I'll try to move around instead of just turning my head.

It's a good show, shame it got cancelled, but it still finishes up okay. Yes, you should try moving and interacting if you can. See here too, in the comments. An example:

After going to bed but before falling asleep some nights I close my eyes and feel as though they are wide open. It's like the muscles in my eyes won't relax. During these times I see as though my eyes are open. I can see the room that I'm in perfectly. It took me a while to realize that even though I see the room, it's not the way the room really is. It's the room as my mind would make it. It's interesting when it happens because you really believe you can see through your eyelids, but it's just your body not ready to shut off and sleep yet. Upon waking and turning on the lights, I normally just see red and dots in my eyelids before my eyes open and adjust to the brightness. If I'm sick sometimes the red dots swirl in circles. Anyone else get these things happening to them?

Q: You're awesome TriumphantGeorge. I wish someone else could borrow my eyes when it happens so they can see what it's like. After it happens I get one of those intense feelings of "we don't really understand everything about the universe yet, what if, what if, what if."

Indeed! [<https://www.youtube.com/watch?v=gBaXd7dz404>]

It reminds me a bit of OOBЕ stories from Robert Munroe and so on. See this quote from his book Journeys out of the Body, where he 'projects' and finds himself in a persistent alternative world with some regularity, looking through the eyes of a particular person/character in that world. Excerpt:

Locale III, in summary, proved to be a physical-matter world almost identical to our own. The natural environment is the same. There are trees, houses, cities, people, artifacts, and all the appurtenances of a reasonably civilized society. There are homes, families, businesses, and people work for a living. There are roads on which vehicles travel. There are railroads and trains. Now for the "almost." At first, the thought was that Locale III was no more than some part of our world unknown to me and those others concerned. It had all the appearances of being so. However, more careful study showed that it can be neither the present nor the past of our physical-matter world.

POST: My brother and I witnessed an event that couldn't be explained involving my wife and two other guys that couldn't possibly have been there

Q1: The whole point of parallel realities stemming from the Many Worlds Interpretation of quantum mechanics is that they are parallel, meaning we can't affect or observe it and they can't affect or observe ours. So that wasn't it. If the universal waveform split in such a way that that happened, you would never know. My take as a physics guy.

Q2: But Isn't the entire point of this sub the possibility of "glitches" overcoming the divisions between worlds?

Q1: Possibly. But, to me, the most interesting stories are ones that can't be solved by seemingly any logical explanation. Tossing out the idea that a person experienced such an event that it literally rewrote our entire idea of modern physics seems too far-fetched to me. Same problem I have with "wormholes" and such. Could I be wrong? Sure. This is just how I feel as a skeptic and science person.

Q2: Could I be wrong? Sure. This is just how I feel as a skeptic and science person. I can respect that. Just keep in mind that "our entire idea of modern physics," like any scientific field, is nothing more than the model that best explains our observations. And physics is one field where new observations are being made every day that are getting harder and harder to explain with the model we've been working with.

Q1: Actually, most of our models are doing a bang-up job of explaining everything. The one we need most is quantum gravity and it would solve most of our current observational problems.

Oh, and something for consciousness eh?

The thing with glitches is, they are not repeatable. Physics, naturally, is about accounting for regularity; most of life (lived, experiential life) is not regular on a macro scale, it's a series of one-offs, so the best ones are always going to be unexplainable, even just because you can't get sufficient info. But you never know...

Remember when ball lightning used to be dismissed as people imagining things?

Q3: Not that person, but your ball lightning question reminded me of something I learned recently. The crackling/sizzling sound heard when a meteor is visible does not come from the meteor. Rather, it is produced by objects around you receiving radio waves from the meteor. When people first started to study meteors, the sound was dismissed as imaginary because it was known that sound would not be able to travel from the meteor to the observers in time to be experienced simultaneously.

That's a great little fact - thanks.

Q4: Ya, what you are saying makes absolutely no sense whatsoever. You agree that there might be 'Many Worlds', and that they are parallel, which simply put says that they exist concurrent to are own, like its 3:57am here where I am at, and in the parallel reality it is exactly the same time. So why exactly couldn't something strange, that science simply hasn't seen or heard of yet, have happened that day for a brief moment, like a rift opened up and they were able to observe, and maybe even effect had they gotten out of the car. In that sense, they may have gotten trapped in it. Now before you start spewing sciencey facts at me, let me remind you of something I think even the most brilliant people forget about. The Earth itself is moving at over 1,000,000 km/h through the universe. Are you telling me that it isn't possible the our little blue planet doesn't simply 'smash' into dark matter or other strange unknow things that cause peoples 'glitches'. It's actually amazing that it doesn't happen more often if you think about it.

Q1: You agree that there might be 'Many Worlds'
It's an accurate quantum formalism.
which simply put says that they exist concurrent to are own
No, it doesn't. The MWI says that each quantum decision creates it's own branch in the universal waveform, separating the new realities forever. It doesn't mean "concurrent."
like a rift opened up and they were able to observe,
Because causality doesn't work like that and "rifts" of that sort are not backed by any physics or mathematics we know of. It's little more than religious sci-fi.
Are you telling me that it isn't possible the our little blue planet doesn't simply 'smash' into dark matter or other strange unknow things
Dark matter is just some kind of matter that interacts gravitationally but not with electromagnetic fields. Is it possible? Sure. It's also possible there's a duck called Billy that keeps the sun glowing and that nuclear fusion is just his farts. Doesn't mean it's likely.

Multiple Worlds isn't a very persuasive idea either. I'd go as far to say the interpretation isn't very scientific. Where's the benefit between Copenhagen wavefunction collapse or Bohm's deterministic quantum potential?

Dark matter is nonsense too. :-)

The problem with the OP story is there's just no way why it can't happen, but in way to explain if it did. Any "explanation" - rift, shared hallucination, reset - is just another fun bit of storytelling. The answer is always really: don't know.

Q1: It's persuasive in that it's a complete quantum formalism that yields the proper empirical results.
Dark Matter is hardly nonsense. we observe aberrational rotation curves in the arms of our galaxy. There is some gravitational influence.

So is active information, say, if some sort of determinism is what you're secretly after. Really, though, multiple worlds so that all possibilities occur? This problem only arises because discomfort with the original 'collapse' interpretation. The maths is the maths and works anyway (Bohr says: it can't be understood, it just works); trying to make it more palatable and picturable with what really amounts to pseudo-science-fiction tropes is embarrassing.

Dark Matter: The observation is the observation, of course, but whether it is gravitational "influence" or a sign of our present clumsy formulation of gravitation is another matter (excuse the pun). Inventing a brand new type of matter that has not / cannot be observed is fine as a placeholder, of course, but that it is taken so seriously as a possible final solution is a bit poor. What's more likely: an incomplete understanding of gravitation that turns out not to scale well or misses a rotational characteristic, or a mystery hack-job type of matter there's never been any sign of?

(Having a bit of fun here, obviously.)

Until we can empirically separate the formalisms, they are all equal with only metaphysical differences.

Quite so. It's all about which adjective you add to each formulation: "embarrassing", "infinite-speed", "spooky". Fields were "spooky action at a distance". The problem here is that you get the same results, so currently it's a matter of personal preference, of what sits best with your own biases. To me, waveform collapse is story-making, a results of viewing things as "parts" and "steps" and a slight "personification" of the phenomena.

It's a bit more than a placeholder at this point.

It's about inaccessible scales, though, isn't it?

Anyway, we'll see. The boundless enthusiasm everyone has for their 'the end of history' solution is always interesting. I feel that the final (temporarily final, of course) formulation for this will be something else. It just feels "hack-job" and "faith" at the moment. But the fun is in the unfolding of it all.

We know that galaxies cluster along tendrils of invisible heavy mass.

We don't know this at all. We know that galaxies cluster, we don't know about heavy mass. And so on...

POST: The only glitch I've ever experienced; Exactly what happened to me? Did I die?

[POST]

Disclaimer: This might be a long read for some of you, and for that I'm very sorry. I've never told anyone about this and it's been a truly cathartic experience for me, finally being able to let everything out. Once I get home I will probably go back and edit out some of the more unnecessary details just for readability's sake.

When I was a child, I discovered a cool eye-trick that kept me occupied when I was bored. I found out I could bring things into and out of focus by shifting my field of vision from looking 'at' to looking 'through'. To clarify, if I was staring at something like a cereal box, I could 'blur' the text and images until they were unintelligible, then snap everything back into clear focus.

I would practice my secret ability growing up by staring at something and seeing how many consecutive times I could repeat this cycle of blurring and un-blurring before breaking. Over the years, I realized my eyes had developed a sort of unconscious tic where they would lose focus automatically and seemingly vibrate back and forth rapidly. Whenever this happened everything would go blurry for a quick second before returning to normal. I've never been able to catch myself in a mirror and see what it actually looks like, but that's what it feels like. If I were to describe it more, I would say it feels like my eyes are going "bzzt", sort of what you would imagine Jerry the Cat's eyes to look like after having been smacked in the head with an over-sized mallet.

While this tic was worrying the first few times it happened, it was never followed up by a seizure or heart-attack so I never really felt the need to disclose this oddity with anyone.

Fast forward to the ripe age of 22; I had graduated with my B.S. in Comp. Sci and moved back home with my parents until I could hopefully find a job or a paid internship. The year I graduated was my sloth-period. I would wake up at noon, halfheartedly look for start-ups, work on some personal projects I finally had time for, and mostly play all the games my heart desired.

The incident occurred some time in early-mid May of 2007, because I remember the grisly VTech incident had recently happened. I'm not one to pay attention to everyday mundaneness, but I remember this day with crystal clarity, thanks to years of mind-wracking analysis and post-speculation.

One Friday in May I awoke to find, instead of food on the dining table, \$30 tucked under a coaster. I checked my phone and my mom had texted me, saying that her and dad had gone to one of their warehouses in Arizona to take care of some urgent business and would be back by Sunday. I checked the fridge, saw hot-pockets, and decided I wanted to eat out. It was at this point I should've realized something was off- what kind of person says no to hot-pockets?!

I made my way, bleary-eyed, to the garage and unlocked my car. Once I got in, I started the ignition, started playing my favorite album by the Red Hot Chili Peppers, and pulled out of the driveway. Drumming my fingers to the beat of the song, I made my way down to the main road while pondering what to eat (I lived in a small residential community in a low-mountainous area, and it takes 8-10 minutes down a stretch of mostly empty road to get to the first main intersection). I settled on a Double Western Bacon from Carl's Jr so once I got to the first main intersection I got in the left-most lane, flicked on my signal ticker, and waited for the signal to turn yellow.

Then my eyes buzzed.

What I can only describe as a very vague, vignette-effect sort of haze seemed to layer my vision. The light blinked from green to yellow. I shook my head, and blinked hard to

clear my vision. The light was going to turn red, so I pivoted and started turning.

I heard what sounded like a boat-horn pierce the air, and what appeared to be, and indeed was a Hummer H2 bearing down on me like a full-powered steam locomotive. Time did not slow down, nor did my life flash in front of my eyes. I only had time to experience what felt like the world's steepest roller-coaster in the pit of my stomach, and think to myself "Oh shit", before the SUV crashed into the side of my compact full force and I felt my body perform a twisted, gruesome marionette-like dance.

Then, as cliché as this may sound, I experienced what I can only describe as a kind of 'intense vibration' start from my head and envelop my body, accompanied by a rushing blindness and a feeling of instantaneous displacement. I blinked- metaphorically I suppose, since I should probably be dead at this point.

I was in my car again, foot planted to the brake and hands on the wheel, fingers mid-drum.

My eyes buzzed.

At that moment a rush of electricity surged through me; at the same time, I was utterly paralyzed. The music started sounding tinny, like it had been submerged in water.

The light turned yellow.

My hands gripped the steering wheel, as a bead of proverbial sweat rolled down my temple.

What the fuck just happened?

The light turned red. What the FUCK is going on? I instinctively closed my eyes as the H2 roared past the intersection, whipping a gust of wind through the open window. The music came back, flooding the deathly quiet intersection.

There were no cars behind me or around me, so I spent a good few minutes at that intersection, foot firmly rooted to the brake and hands still gripping the wheel. I was finally able to un-lock my body enough to shakily finish the journey to the Carl's Jr. parking lot, where I chain smoked until my nerves cooled.

It's been over 7 years since the incident, and I've spent a lot of time thinking on it, wondering exactly what had happened back there.

Was it just a premonition, or did I somehow go back in time?

I so vividly recall the moment of impact and the feeling of being thrown about by a giant, invisible hand- it felt so real to me that I still get goosebumps. I still have no idea what my eye-blurring ability had to do with anything. To this day my eyes still do the involuntary buzzing, but no more "premonitions" or anything of that sort. This was the first and only glitchy occurrence I've experienced.

[END OF POST]

Q: What if we never die? What if, when we die, our consciousness or spirit or whatever is transported to an alternate universe that is identical in every way except for the split between our death? That universe in which we died exists, and we will be mourned, but our consciousness no longer exists in that universe - it now exists in the alternate universe where our death never occurred. What if this happens every time we 'die'?

What if that happens every time we make a decision? What if we are 'extended people' across all possibilities, but we only look through the "viewport" of one possibility at a time. For the other worlds, we are 'philosophical zombies', operating on automatic. We only have free will and influence over our "viewport" world.

This would certainly be quite probably in a many-worlds universe in which me in World A does THIS whereas me in World B does THAT.

What I'm curious to know then is, would all my other "me's" lead drastically different lives, if there is always a "me" that takes an alternate route from me? Shouldn't that make sense?

Imagine that, right now, what you see before you is in fact an image on a screen, depicting this current world-moment. Now imagine that you stand back, and realise that image is actually in a grid of images that stretch infinitely in all directions, containing all possibilities.

Every time you make a choice, you are essentially traversing that grid moment by moment, traversing this 'possibility space'.

It's not quite right to think of there being many of "you". You are not your body; your body is a part of the environment. What "you" are is the conscious awareness that "looks out through" the body, of a particular moment/possibility.

== Wow, that idea will stick with me for probably the rest of my life. As will that visualization of stepping back and seeing a grid of possible lives.==

Yeah, it's my favourite image for this.

If you find that useful, you might be interested in the comments in this post and an attempt to explore the idea in the guise of 'pseudo-time-travel' as a thought experiment here/ (Although the second one is a bit convoluted and mixed into the comments, since it was an attempt to bring out the details via a dialogue.)

Mixed that up with the idea of waking life being a bit like lucid dreaming, and it's quite a powerful idea.

I've entertained the idea that life itself was a mere lucid dream or a simulation perhaps. I don't think that very much anymore, it's an interesting thought but I just get hung up on how vast our universe is with such intricacies, it seems to real to be fake.

Have you had many lucid dreams? They are often more "real" than this experience.

The universe isn't vast, except in your thoughts (neither is it small, though). Your actual daily experience probably covers a few miles at most. And even then, in what sense do you actually move through those miles? Do you go to them, or do they come to you...?

You have to watch and not confuse what you think-about something with what you actually experience of it directly.

It is important to realise that, if you investigate, there is no "underneath" to your experience that you can detect; you are basically dreaming all the time. What you see is what there is, to you. Whether you then think your dream is "inspired by the senses and an external world" or not, your experience would be the same. You can't tell the difference!

This doesn't mean it is "fake"; it just means it (literally) isn't what you think it is.

...

Q1: Thank you for sharing your story. Of course, I have no idea what might have happened! But the "eyes" thing made me think of EMDR, a technique psychiatrists use with PTSD patients and others. In some cases, the eye movement therapy seems to prompt them to go - in their own consciousness (but how else would one "go"?) - into another dimension. You might find it interesting to read about it!

Q2: Thank you for reading! I will look into eye movement therapy and see if I can unearth anything.

The idea is that it helps break the link between traumatic states and certain stimulus. But in a way, that's quite interesting for this too.

...

[QUOTE]

Quantum suicide and immortality:

In quantum mechanics, quantum suicide is a thought experiment, originally published independently by Hans Moravec in 1987 and Bruno Marchal in 1988, and independently developed further by Max Tegmark in 1998. It attempts to distinguish between the Copenhagen interpretation of quantum mechanics and the Everett many-worlds interpretation by means of a variation of the Schrödinger's cat thought experiment, from the cat's point of view. Quantum immortality refers to the subjective experience of surviving quantum suicide regardless of the odds.

[END OF QUOTE]

POST: Déjà Vu: Is it really a thing?

Or, maybe Déjà Vu is a real thing but is wrongly used by the majority of those who use it and it is much rarer but it does happen...

I think this. People say 'deja vu' when they really mean "that's familiar but I can't quite place it". The experience is stronger than that. It's pretty hard to investigate experimentally or prove though, because it's not a controlled experience: it happens as "part of life". Unless you happen to have written down a dream or prediction, or happen to put aside your surprise to tell your friend "this is about to happen", you can't. And even then, the actual event won't be recorded except as an anecdote. (Plenty of those on 'glitch' I think, if you search.)

Maybe when people start wearing Go-Pro/Google Glass all the time, we'll be able to get some evidence. :-)

*Q: Maybe we're all just a part of the Twilight Zone
Jokes aside, it is a real phenomena in our brains. There are theories which explain this physiological reaction. I say that stress causes it in the brain would which results in inability to distinguish different memories and their timelines.. So an old memory overlaps and you may feel like you don't know which is happening.*

Sure, there are theories to 'explain it away', for instance:

The psychologist Edward B. Titchener in his book A Textbook of Psychology (1928), explained déjà vu as caused by a person having a brief glimpse of an object or situation, before the brain has completed "constructing" a full conscious perception of the experience. Such a "partial perception" then results in a false sense of familiarity.[1] Scientific approaches reject the explanation of déjà vu as "precognition" or "prophecy", but rather explain it as an anomaly of memory, which creates a distinct impression that an experience is "being recalled".[2][3] This explanation is supported by the fact that the sense of "recollection" at the time is strong in most cases, but that the circumstances of the "previous" experience (when, where, and how the earlier experience occurred) are uncertain or believed to be impossible.

But with no actual research, this is just story-making, rather than a scientific investigation. Plenty of deja-vu reports have the author remembering the source, or being able to anticipate events in advance as it unfolds - beyond simply 'feeling familiar'. A pretty hard thing to do research on, mind.

POST: clear plastic lunchbox like thingy through which you can see stuff

[POST]

Hi, I am new to reddit and not sure where to post but this place seems suitable enough. Years ago when I was around 6, there were two sisters in my school bus who always had this clear plastic lunchbox like thingy through which you can see stuff. If you held the lid of that box in front of you, you could see a 'film' being played. Not like on a television, but as if you are watching through a lightly tinted glass. The lid had to be held in different angles, sometimes it worked, sometimes it didn't. I only looked through it a few times but remember two films very clearly. Once there was a man who was sitting in his office writing on a paper. There were grey blinds in the backdrop, a pencil holder and a woman standing beside him. After a while, (seconds?) the man turned to talk to the female (no audio). The other time it was just a flower swaying in the wind. I saw more but I can't recall. They were always videos/films, never a mere image. Also, the films were always different. I remember asking my parents to buy me one of those boxes (they had no idea what it was). At that time, I didn't think much if it. We moved and I eventually forgot about it. Maybe it is a toy or something which I am not aware of but I never came across anything like it again. I Googled too but to no avail. I thought I'd post here to see if you guys have any idea. Thanks.

[END OF POST]

Are they lenticular images? The surface shows a different image depending on the angle you view it at. Changing the angle makes the picture "move" as you go through the images.

See quick video on lenticular images on bookmarks, for instance [deleted]. Used to get them on rulers, lunch boxes, stickers, mousepads, etc.

[QUOTE]

Lenticular printing:

Lenticular printing is a technology in which lenticular lenses (a technology that is also used for 3D displays) are used to produce printed images with an illusion of depth, or the ability to change or move as the image is viewed from different angles. Examples of lenticular printing include flip and animation effects such as winking eyes, and modern advertising graphics that change their message depending on the viewing angle. This technology was created in the 1940s but has evolved in recent years to show more motion and increased depth. Originally used mostly in novelty items and commonly called "flicker pictures" or "wiggle pictures," lenticular prints are now being used as a marketing tool to show products in motion. Recent advances in large-format presses have allowed for oversized lenses to be used in lithographic lenticular printing.

Image i - Close-up of the surface of a lenticular print.

[END OF QUOTE]

No, it wasn't a lenticular image. The plastic lid played short clips without any interruption, they weren't pictures. The clips were very clear unlike lenticular images, just a little tinged. Thank you for replying though.

Interesting. Definitely my best effort. So, you didn't have to move the box while the 'video' was playing? Only to get the best angle for viewing?

How long ago was this?

Yes, just the right angle would do. Maybe something to do with the light? It was mid 90s. I know it is very long ago but I remember both the scenes like it was yesterday. It really bugs me not knowing what the heck it was. :|

Hmm, annoying. It can't be really a 'video clip', technology-wise. Maybe it is lenticular-related, but it "played" in some way. I really want to know now. I was a bit beyond "lunchbox age" at the time though. Going to have to ask about!

POST: Knocked unconscious, mysteriously moved way further than was possible from fall

[POST]

First time post, been reading lots of stories on here and finally I remembered my very own Glitch in the Matrix I experienced when I was younger but didn't care to think much of it at the time. It happened during recess in the 4th Grade. There's a jungle gym located right around a corner of the school, there's doors close to the corner that lead right out to a large blacktop area that extended the length of a football field, like a big square, with basketball courts and tetherball courts. The jungle gym around the corner is to the right 40 feet if you walk out the doors. And there's a much BIGGER jungle gym with swing sets that are located on the FAR side of it. This bigger jungle gym's perimeter begins 40 ft. to the left of the doors. So my friends and I were playing tag across the entire playground, it made the game more challenging and fun with this much space to run around, more places to escape to, run around, and lots of kids you could easily hide yourself amongst. I was hiding out in the playground around the corner at the very top, looking out for potential 'taggers.' Suddenly one of friends who is "it" spots me just as I'm about to climb down. I scurry down the ladder, run around the jungle gym, and make it out onto the blacktop. My friend is hot on my trail, and I corner it and begin heading to the larger jungle gym. I'm not half way across the width of this last basketball court when I see a girl from my class out of the corner of my eye. This girl has anger issues, everyone thought she was annoying, always asking dumb questions that were already explained, acted like a dog in class, just plain weird, (personally I think she had some form of autism, but we were kids, didn't really care.) But she's running at me in a pursuit angle with her arms out in front of her. I saw it coming, but I didn't stop sprinting because my friend was behind me. BAM! (She was a lot bigger than me.) I remember going airborne for what seems a split second, I see the world upside down, feel gravity take hold, then instant black. I had hit my head on the concrete on what couldn't have been less than 10 feet away from the edge of the jungle gym where the woodchips began... I emerge from the blackness dazed at first. I'm on my back sprawled out ALL the way on the woodchips on the FAR side of the jungle gym right in front of the middle of the swing set. I could have maybe believed waking up on the woodchips toward the edge of the jungle gym, but I was over by the swings... Unless I had flown over the entire jungle gym, there was no way I could have rolled unconsciously all the way through a large, connected jungle gym that has all the walkways, several slides, stair cases, tunnels, the whole shebang... I had hit my head on the concrete which must've been 180 feet away from where I awoke. It had seemed really strange to awaken at that spot, but I quickly overlooked the fact as I asked the kids who surrounded me what happened. I asked how long I was out and a kid said, "I dunno like 30 seconds..." He was just staring at me with caution as I had just been knocked out. Other kids attested to his account. I asked "What happened?" (Just to be sure what I remember from before waking up was true.) The kids told me that I had hit my head on the concrete and blacked out. But I never asked how it was possible that I had moved that far from the place where I simply hit my head on the concrete, and how I moved that far in that amount of time. I grabbed my friend, sat down at a table and continued to gather my thoughts, the small throng of kids had broken up, and no teachers had noticed the incident. (Which is really weird because there is usually a few teachers out on the blacktop watching kids, they surely would've noticed a kid lying unconscious on the blacktop or near the edge of it.) My friend asked me if I'm alright, I tell him I'm fine then decide to grab a teacher just to be safe. I tell the teacher I had been pushed down on the blacktop then had awoken over by the swing set. All she did was ask about who did it, what was going on, and she checked my pupils. But I was born with different sized pupils so she couldn't really tell if I was concussed I guess. So, all the while in the back of my head I keep thinking that's just weird how I got all the way over to the swing set lying stretched out on my back, in under 30 seconds unconsciously, surrounded by like 15 kids who had been eagerly waiting for me to come to. I couldn't have been knocked out too long or else someone would've gotten a teacher. And no one mentioned that girl who had pushed me. No one mentioned how my rag doll of a body came to be over by the swing set. But I figured that's not the important information right now. So my teacher and I go find the girl that pushed me, she's blushing with guilt. She doesn't fess up but instead starts trying to back herself up. She gets taken to the principals office by a teacher, but I couldn't help but feel bad for whatever reason... I mean I wasn't in any pain (yet), I felt pretty okay, and honestly thought it was kind of cool, it was my first ever knock out (except given to me by a girl.) Maybe it was cause I thought she didn't "know better," but I ended up having a grudge for the sprained ankle I'd get and the crutches is have to be on. I end up going to the hospital, get scans, they determine I have a concussion, and I sprained an ankle from the incident. All I remember was being upside down hitting my head, and my ankle didn't hurt until later that day. But still the question lingers in my mind, how did I just seem to "transport" across a jungle gym. I doubt that girl would've been able to pick me up, carry me across the jungle gym (in under what must've been 30 seconds) without getting weird looks from teachers and kids. I mean that playground is filled with the entire 4th grade of the school. It doesn't really bother me since it happened 8 years ago, it's just one of those unexplained glitches of the Matrix I guess... no logical answer other than a glitch or "jump" in the system. Does kind of bother me know that I'm thinking about it a lot though. I KNOW I shouldn't have landed that far away from where I hit my head but I never asked for my "tagger" friends account of it even though I felt I should've, something made me think otherwise... I blame my young mind for not really caring for all the logical details, but maybe it was the Matrix making me think otherwise. I don't know. Won't be explained, just wanted to share my unconscious teleportation glitch.

[END OF POST]

But I was born with different sized pupils so she couldn't really tell if I was concussed I guess.

Basically, you were born concussed:

In a few decades' time, you are going to suddenly 'snap' back to being lying there on the concrete, all those years having been an instant dream.

Or, in a few hours' time, you are going to suddenly 'snap' and you will find yourself aged 35, lying in bed with your arms around "that girl with anger issues", having been awoken by the gentle crying of your new-born son in the adjacent room, then telling her you had the craziest dream starting from back when you two first got together, when you collided at the gym that day.

POST: I found this interesting.

[POST]

I am sorry if this has been posted before. I found a video in Youtube from 1977 about glitches in the matrix. [<http://youtu.be/jXeVgEs4sOo>]

[END OF POST]

I love that.

People might also enjoy his essay How to Build a Universe That Doesn't Fall Apart Two Days Later - available here [<http://yin.arts.uci.edu/%7Estudio/readings/dick/index.html>] - which is very glitchy after the halfway mark when it mentions his book Flow My Tears, the Policeman Said with an interpretation similar to that referenced in the video.

Meanwhile, the transcript for that conference session is available here [https://ia601907.us.archive.org/16/items/PhilipKDickSpeechExcerpts/PhilipKDick_Speech.txt].

Q1: Thanks for that link.
In the latter part of that video he ad-libs some bits that don't show up in the transcript:
"We live in a computer-programmed reality and thre only clue we have to it is when some variable is changed and some alteration in our reality occurs we would have the overwhelming impression that we were reliving the present perhaps in precisely the same way hearing the same words saying the same words and I submit that these impressions are valid and significant and I will even say this: such an impression is a clue that at some past time point a variable was changed -- reprogrammed, as it were -- and that, because of this, an alternative world branched off..." - Phillip K Dick

Well spotted! That ties the two together nicely.

Q2: I've read this guys books Do Androids Dream of Electric Sheep (aka Blade Runner) and Valis. He has some very interesting literature and I strongly implore you to read it. Maybe not Valis though, that was just weird and it was known the main character is supposed to be him. He had a lot of LSD. But still, so did Alan Watts and he was a very lucid person. In fact, he claims LSD was a shortcut to nirvana for some people and allowed them to see beyond the limitations of the confinement of their minds. I am yet to try LSD...

Q3: While I'm not opposed to hallucinogens, there is no shortcut to nirvana. And there is a much, much more severe chance of psychological distortion with drugs than most other paths to nirvana, or whatever that word means to you.
Alan Watts had many amazing things to say, but he drank himself to death. This is not what a person free from suffering and clinging does.

Hmm. I was looking into that (gurus, enlightenment, simulations and the like). Info dump:

Alan Watts was a funny one. He was great to read and listen to, and he did say he was a "philosophical entertainer" rather than an actual philosopher or Zen buddhist. A guy who knew him wrote this [<https://web.archive.org/web/20120513200444/https://leroywatson4.wordpress.com/2012/04/28/alan-watts-scoundrel-or-spiritual-entertainer/>], which seems like an honest assessment, excess wives and booze and all!

Thing is though, enlightenment itself doesn't necessarily change your character [<https://paidtoexist.com/enlightenment-is-overrated/>], apparently (see fallacies [<https://web.archive.org/web/20140325044045/http://lovebliss.eu/fallacies-about-enlightenment.html>]). Nisargadatta Maharaj, of I Am That fame, ran a tobacco shop for a living and died of throat cancer. Similarly others. See here [<https://www.facebook.com/JoanTollifson/posts/434342306638108>].

All enlightenment is, is seeing that how you think about the world is a fiction, and perceiving that directly. You can do the Douglas Harding experiments in ten minutes and see it for yourself. It won't make you a better person instantly or less grumpy even necessarily, although you might have greater compassion because 'everything seems to be part of you', and it will change your perspective, literally.

This stuff is all fun to think about, and weird experiences are cool, but in the end I think it doesn't matter much. This might all be a dream/simulation, but we're in it and are bound to its rules. We can stop identifying with our "simulation character" though, then treat it as an "experience machine" and revel in it.

(To any "seekers" I'd say: Do the Harding experiments, use the new perspective to stay relaxed and alert during your day and get on with your life, making the most of opportunities that arise for new experiences. If you still feel the urge, read Presence by Rupert Spira or The Direct Path by Greg Goode or Douglas Harding's own Head Off Stress - then resume. Still dissatisfied and want something more kooky? Alan Chapman's Advanced Magick for Beginners, to help things along.)

. . . enlightenment without understanding its coincidence with personal change is like . . . This perception is enlightening, but not enlightenment.

It's a matter of definition though. You can truly understand and experience the nature of the world, but it doesn't necessarily improve your character. That's something you have to work at, perhaps. These are two different things, as I see it.

You might be better to call it 'realisation' (seeing clearly how things are) and then something like 'integration' (where you dissolve the boundaries).

You can 'realise' and still have very much a person-based experience, but now within a new context. Changing that experience is something you can focus on through self (small 's') examination, although I'd say that change does happen by itself gradually as identification loosens somewhat. Increased connection and so compassion, etc. But it doesn't necessarily mean you're going to be all "pure living", I'd suggest?

I just came across this which had interest, maybe [<https://web.archive.org/web/20140818031838/https://oeith.co.uk/2014/08/05/on-retreat-with-alan-chapman/>].

(1) Awakening ≥ (2) Liberation ≥ (3) Enlightenment

Where "awakening" would correspond to what I termed "enlightenment" in my post. Achieving a non-dual perspective is not equivalent to 'freedom of the personal self', fair enough.

...

This is exactly true. I want out.

But those steaks are just so damn tasty...

Thing is, when you get out you might find you are... Dwayne [<https://www.youtube.com/watch?v=BVupRsbx8UM>] - Dibbley [~~deleted~~]...

POST: glitch

[POST]

This happens like once a month for me but occasionally, I'll be going about my day and for whatever reason, I'll need my mother and she is normally in her room. When the time comes to go find her, she is nowhere to be found. Both cars are always in the garage, I now make sure to check all the bathrooms (despite the fact that the lights are always off), and she isn't in any room in the house. But then I always return to the kitchen, call her, and she comes out of her room asking what I need, claiming she was in her room watching tv the whole time, and my dad normally agrees. Not as intense as a lot of these stories but this as happened to me too many times for me to not post it on here. When I told my mom about this happening, she just laughs it off. I told one of my internet friends and he thinks I can travel to different dimensions, but it's out of my control...

[END OF POST]

If she was quietly reading/watching TV, etc, it might be that she's just "gone quiet", like in this story. People have practiced this technique to be invisible (really: be less noticeable), apparently.

Your mother is therefore a ninja.

But most of the time, the tv won't even be on..

Then all the quieter...!

Unless you mean she says she was watching TV and it wasn't on. Is that what you were getting at?

Yeah like after I'm done looking and she says she's in her room, I'll go to her room and she'll be lying down watching tv like she was there the whole time. But when I look in her room, before calling for her, the tv will be off unless my dad is watching something.

Very interesting! So it's more like she's off somewhere else completely. Bizarre!

(Which, of course, is the point of this subreddit.)

There are quite a few "people going invisible" glitches though, suggesting that maybe there is more of a something-going-on rather than just the usual randomness.

POST: The I Ching Becomes Opposite

Q1: There's a theory that when this happens it's because we accidentally switched universes to one that's almost the same but slightly different. Our memories of the old universe remain but through our experience we notice the differences. However that's just a casual jokey theory to explain this. What it is more likely to be is that our memory isn't as set in stone as we like to think it is. It can be very malleable and we can be completely convinced that we're right even when we're completely wrong. Look up false memories. I think one of the reasons this happens is that we experience things linearly but our memories related to an experienced event are affected by memories and experiences from our past and the future. [<http://www.unisci.com/stories/20012/0613011.htm>]

Q2: Yes, this could be true, that's the entire nature of a glitch though, because of this we never have proof, we never have enough evidence even if pictures were taken, something would happen to where the pictures would disappear, or the camera would, or the SD card would, etc etc and on and on, in the end this is why it's always happened this way. If a glitch left a trace of evidence, we'd have the answer we so desperately need, and it won't be a glitch any longer, it'd be explained fully and no longer a mystery. Then there'd be no need for this reddit.

Indeed. The principle of 'self-consistency' means that the changes are always coherent with the rest of the experience. The only thing retained is your memory of the previous way, and if your lucky you share that with another person.

Of course, it's probably happening constantly with nobody having the previous memory.

At each moment, the world is re-created from scratch, taking everything into account over all time and space. Which is nice. But how to harness this?

I wish I knew

Intentionally switching universes.

I wonder if people have glitch stories where they are aware of some 'cause' rather than it just happening. The website realityshifters.com has stories that are basically glitches, but some of them imply someone doing things deliberately. But then it's like 'magick'.

Q3: Which is nice. But how to harness this?

Keep checking those lottery tickets even if you know that you lost?

Surely the other way around:

- Step 1: "Know" that you won.
- Step 2: Check those lottery tickets.

Q3: not if we're talking about glitches in the matrix. The OP knew from experience that how to read the i ching the right way. But hen the universe changed and it became the wrong way.

So the op might've bought lotto tickets and lost. Then later the universe might've changed and the same lotto ticket's numbers might now be the winning combination.

I follow you. Of course. The whole point is that your 'knowledge' has stayed the same before you discover that the 'world' has changed.

POST: [deleted by user]

These things can "just happen", apparently [<https://www.theguardian.com/lifeandstyle/2012/oct/12/experience-head-injury-musical-prodigy>]. Perhaps knowledge is "accessed" rather than acquired, and the "learning process" is actually just one of relaxation and acceptance of one's innate talent.

Rupert Sheldrake's "morphic responce" theory holds it that once something is learned by a group of people, it becomes easier for others to learn it. As if the universe operates according to "acquired habits" with persistence. (He references rats negotiating a maze in one part of the world making it easier for others elsewhere. Also, scientists trying to grow a particular crystal structure, very difficult. But once one lab succeeds, other labs find it much easier suddenly.)

I guess it's just amazing the way the brain works, I know I'll never fully understand it hahaha

hahaha, indeed!

POST: What are shared hallucinations? [x-post /r/Psychonaut]

[POST]

I kicked meth over a year ago, but something has puzzled me about my experiences back in those days. Back then I would tweak with a group of friends, and we would play this game. When amphetamine psychosis set in, when the hallucinations really started getting interesting, I would write down on a piece of paper what I was seeing, point to the spot, and have my friends tell me what they saw. Then I'd show them the paper. 90% of the time it was, detail for fucking detail, the exact same things. Whenever something startling would happen, say a grotesque meth monster appeared out of nowhere, we would all jump at the same time because we all were exploring this alternate reality together!

How could these be hallucinations?

We came up with a theory. Perhaps the brain functions as a radio receiver of sorts, and our perception of reality is the station we're tuned into most of the time. Something about the combination of sleep deprivation and dopamine/serotonin receptor over-stimulation must allow us to "tune into" other stations (dimensions) and allow us to glimpse into them without leaving our own. Edit: Kind of like an oldschool knob-turn radio halfway between two stations, receiving parts of both transmissions.

I dunno. It all sounds stupid now that I type it out. But I have no other way of explaining my experiences back then. Help?

[END OF POST]

A1: If it's a shared experience, it's not a hallucination, because hallucinations are entirely subjective. As such, there can be no such thing as a mass-hallucination either. When you mess around with brain chemistry, you can get all sorts of weird sensory effects. Just look at the Erowid Experience Vaults. There are a lot of similar observations made when using the same substance, like the famous DMT elves. That's not to say that people cannot be suggestible, we are, and many of us will lie about things to fit into a group; from laughing at a joke you don't get or claiming to see the same religious figure floating mid-air; because we often don't want to be excluded. And while it can be difficult to detect when intoxicated, when sober its easier to notice a longer delay (or suspicious lack of one) in response time.

Shared experience - that's better. Basically, it's like having a shared dream, as a bubble in your waking world.

...

Oops, looks like our guy sapped out. I was going to reply:

"Depends on the level of detail. But I agree that people can fall "into synch". The level of the "synch" though, is fascinating itself. If everyone really does hallucinate the same monster, with the same face, and the same everything, then that's amazing and more than just "predictability" that could be accounted for by a shared history leading up to that moment."

POST: Eerily accurate prediction on /x/

[POST]

==Sorry about this post being "ripped from the headlines" of the annoying world of internet drama, but it was just too bizarre and creepy not to share. This is not a post about the ongoing online drama itself, that's just the backdrop to something strange I noticed. To start with, I'm shamelessly addicted to watching pointless internet drama unfold, so naturally I've been following the gamergate/4chan/fappening fiascos from start to finish. To me, the recent situation with Emma Watson and 4chan was especially interesting. Here's a quick rundown for those who are unfamiliar, and pay close attention to the dates that everything happened. I provided links for proof of these dates:

- 9/21/2014: Emma Watson's UN Feminism speech is posted on youtube here. It goes viral.
- 9/21/2014: EmmaYouAreNext.com is created (supposedly by 4chan) threatening to reveal Emma Watson's nudes. A site called FoxWeekly is the first website to post a story about it.
- 9/23/2014: The mainstream media starts running stories about 4chan's horrible EmmaYouAreNext website.
- 9/24/2014: Evidence surfaces on 4chan that EmmaYouAreNext.com was actually created by a company called Rantic Marketing.
- 9/25/2014: Shortly after the evidence is posted, EmmaYouAreNext.com re-directs to Rantic Marketing's home page with this message calling for the shut down of 4chan Still with me? Good. This is the weird part I can't really explain. I'll use links to archive.4plebs, a website that automatically archives posts with their original time stamps.

On Tuesday, I was browsing /x/, 4chan's paranormal board. Mostly it's a bunch of people posting creepypasta and spooky pictures. I noticed a post called "Looking for Anon?" that said the following:

"Well this is more than a long shot but an Anon on here months maybe even a year ago was supposedly predicting the future. He said that he seen the End of 4Chan. This is the only bit of info I remember unfortunately. But he said he remembered the very last picture ever posted on 4Chan and drew it. Was a very badly drawn reaction face. Few weeks later I seen the real picture, was a reaction image of Emma Watson making a face wearing yellow but the /x/ thread was gone. He predicted a bunch of fucked up shit I completely forget. But with all this Gamergate, and Fappening2 shit happening at the same time. Keep an eye out for Emma Watson if we get shut down. Cause then you'll know /x/ is real."

Once more for emphasis- "Keep an eye out for Emma Watson if we get shut down"

One anon found the thread the OP was referencing in the 4plebs archive here. It was posted almost a year ago, on 11/9/2013. It's about a guy who claimed his computer was glitching out and showing him brief glimpses of future webpages and news sites. He said he'd seen "the last posts that will ever happen on 4chan". When asked about the last post on 4chan, he said that it was a reaction image posted under a message from moot (the site owner) about the site shutting down. He tried to draw what he remembered of the reaction image here. Posters said it looked like one of these two reaction images, both of which are of Emma Watson.

Here's where things get weird, so please verify all of these timestamps so you know I'm not making this up. The post I first stumbled upon titled "Looking for Anon?" was posted on Saturday 9/20/2014, the day before Emma Watson's video was even posted. You can view the archived post with the timestamp here. What are the odds the someone would link Emma Watson directly to the attempted shutdown of 4chan the day before her initial Feminism video was even posted? Know about the fake website devoted to her the day before it went up? That in 2 days, the mainstream media would take the story and run with it? That in 5 days, the whole scheme would be revealed as a self-admitted undercover plan using Emma Watson to shut down 4chan? All of this, based on a vague, year-old post?

Could this really be a coincidence? Or could it be something more...==

[END OF POST]

A Google search-by-image on that image -

- there's nothing older than a day available. Is the image you linked to meant to be a new "recalled image" or is it meant to be the original attempt?

EDIT: This is one of the first things to appear on /r/glitch that could potentially be proved by third parties. How exciting eh? I don't see why Rantic would bother. I'd say it's a glitch already in the sense that the overall idea appeared a year ago, and this has played out in the Rantic campaign. It doesn't correspond exactly, but sufficiently. But, y'know, I need to see the image as posted a year ago eh... ;-)

That's the original 2013 poster's recreation of what he remembered the last 4chan post was. He supposedly recreated it from memory. This [\[https://archive.4plebs.org/x/thread/13693414/#13693509\]](https://archive.4plebs.org/x/thread/13693414/#13693509) is the direct link to that archived post.

Ah, right, I wasn't clear from the wording. She's one purty laydee, such golden hair! I like a girl where you can never tell what she's thinking - or where she's looking!

So, as in, his recreation in 2013 of the image.

POST: Phone glitch

[POST]

I was at a cousins house messing around in his recording 'studio' (just his bedroom with sound proofing material). I was recording random bits of my voice and using effects, I was alone in the house as he went to get food so it was completely quiet. I hear my iPhone ringtone but think to myself 'that can't be mine it's on silent and vibration is off' I decide to check and I had a missed call, I missed it by seconds. There's no way it could have been anyone else, no other house around for miles and I was alone, did I somehow 'know' I had a call?

[END OF POST]

I have this too. Moment's before I get a new message on whatsapp, I sense it and look at the screen of my phone.

You're just picking up the high-pitched electronic noise. Your phone has received the message before it updates the screen / makes the alert. (Like knowing a TV is on in the house, etc.)

Holy shit man, reality is collapsible.

Reality is just one big origami project, everyone knows that, simply pick a colour and a number...

POST: Looking for actual tiny glitches to determine if we live in a Matrix

[POST]

FermiLab is running an experiment to determine if we live in a holographic universe. As I read it, they are essentially looking for glitches at the tiniest scale possible.

[END OF POST]

Q1: Something tells me consciousness is the glitch

See philosophical zombies and solipsism, but it's not necessarily both. If we each experience a 'dream world' where everyone is a character, then we too in that world are a 'dream character' - we are actually the dreamer and the dream, and "I" and its body is dreamt also.

With this approach, everyone is a 'zombie' including you, it's just that you are also the dream viewpoint, through the main 'viewport'.

Alternatively, this is shared dream, with most of the people being 'aspects of you' but some of them being viewports for other consciousnesses. This means many dreams, with sometimes only one viewport character - meaning everyone's desired experiences can be accommodated.

Note that here we are not just dealing with "your mind" but "the mind", the mind associated with the dream world, or "ideational space", to borrow a lucid dreaming term.

(Re: "Brains" are just images that you see in the dream. Nobody really has, or is run by, a "brain" - only mind/consciousness, which is fundamental.)

[QUOTE]

Solipsism:
Solipsism (i/'sɒlɪpsɪzəm/; from Latin solus, meaning "alone", and ipse, meaning "self") is the philosophical idea that only one's own mind is sure to exist. As an epistemological position, solipsism holds that knowledge of anything outside one's own mind is unsure; the external world and other minds cannot be known, and might not exist outside the mind. As a metaphysical position, solipsism goes further to the conclusion that the world and other minds do not exist.

Philosophical zombie:
A philosophical zombie or p-zombie in the philosophy of mind and perception is a hypothetical being that is indistinguishable from a normal human being except in that it lacks conscious experience, qualia, or sentience. For example, a philosophical zombie could be poked with a sharp object, and not feel any pain sensation, but yet, behave exactly as if it does feel pain (it may say "ouch" and recoil from the stimulus, or tell us that it is in intense pain).
The notion of a philosophical zombie is used mainly in thought experiments intended to support arguments (often called "zombie arguments") against forms of physicalism such as materialism, behaviorism and functionalism. Physicalism is the idea that all aspects of human nature can be explained by physical means: specifically, all aspects of human nature and perception can be explained from a neurobiological standpoint. Some philosophers, like David Chalmers, argue that since a zombie is defined as physiologically indistinguishable from human beings, even its logical possibility would be a sound refutation of physicalism. However, physicalists like Daniel Dennett counter that Chalmers's physiological zombies are logically incoherent and thus impossible.

[END OF QUOTE]

I've been thinking about this since I was 9...

You must be exhausted by now! Move on to something else?

Q2: The way I like seeing it. We're all the main characters in our own movies. To others we're nothing but the creepy extra staring out the window watching the bus stop.

u/torilikefood: I like making guest appearances in other people's nights, but I don't like to be the center of attention. Let them have their light.

Do all your dreams start with "Previously on torilikefood..." ?

POST: Impossible does happen."impossible" is a metaphor,why haven't redditors realized this by now?

*Q1: Isn't it interesting that if you make impossible two sperate words, you get **Im possible** ==> I'm possible ==> I am possible. If you believe that the **I** in you creates the reality that is, then the impossible is always possible. Just find that rather fascinating.*

Q2: I hope you're not serious.

[QUOTE]

Equivocation:
Equivocation ("to call by the same name") is classified as an informal logical fallacy. It is the misleading use of a term with more than one meaning or sense (by glossing over which meaning is intended at a particular time). It generally occurs with polysemic words (words with multiple meanings).
It is often confused with amphiboly; the difference is that equivocation arises from an ambiguous definition of a word, while amphiboly refers to ambiguous sentence structure due to punctuation or syntax.

[END OF QUOTE]

Sounds great. How does that work though? How do I go about creating the 'reality that is'?

Q1: That's a great question. How, to me, is highly subjective. Much like reality itself. We see a lot of universal ascepts to reality that encompasses both you and I. Beyond the framework of reality itself comes the uniquely individual ascept that is you. Or me. This you is the distinction that seperates our how's, if that makes sense. We are both apart of a larger reality in which our ways of living denote what is possible and equally impossible. I may never come into contact with a glitch that directly affects you, yet I would still believe that the glitch you experienced is equally possible for me -- that glitch is how you and I are related to reality, the framework which gives us both possible and impossible. I tend to think in terms of duality and ultimately believe in a source from which dualism derives. Think of a river and as it flows, part of the stream gets seperated by a boulder and decides to traverse a different path and near the end finds its way back to the larger whole, that is the river. The entire time, while seperated, it was always still apart of the river, because that is its source from which it came. Reality acts the same way. Impossible and possible are the same, but both are distinct paths of reality and yet are still connected and derived from reality. Reality is the collective sphere of both possible and impossible and what seems impossible to someone may in fact be possible to another and vice versa. Hope that all makes sense. I'm not even sure I understood where I was going with that till the very end. So thanks for making me explain. TL;DR:: How you create reality is how you define reality.

Interesting. Alternatively, we are both whirlpools in the same stream, temporary patterns made of the same water. Sure, if our attention is on the whirling, we seem separate, but if you reach down below... there is no separation.

Our own pools have their own structure: reality seems a certain way for each of us, but it actually we are experiencing our own being and structure. We can change shape in order to change this for ourselves; different people have different shapes, therefore possibilities.

The shape of the whirlpool that we are evolves and changes, which we experience as the passage of time. But really, no time passes, and there is no real existence of before-after, cause-effect, doer-done, except as trace memories in the structure of the pool - just like the wake of a ship is the "past" left by the ongoing "present" of the changing location of the ship itself.

TL;DR: Reality is our experience of ourselves. If we change ourselves, we change our possibilities.

I like it. And totally agree. Like an equation, whatever changes on one side, directly changes x or any unknown on the other! Though there are moments where x may equal itself, this is reality finding congruence with itself. Finding oneness throughout the formula.

Another component is that messages and changes travel without adherence to time or space...

If you have a glass of water and add more water to it, the water level doesn't end up higher at one side than the other; the water level as a whole rises. In this way, the 'height' of the water evolves all at once. So it is with the universe. 'Messages' apply to the whole, changes are available to everyone / become part of everyone.

All good fun. But, how to use practically?

POST: Missing Time

[POST]

I personally feel that missing time is very much NOT a Glitch. It is some thing else entirely but I go through it from time to time...
Colorado, about 2 years ago... Back story: Ever since I was a kid, I'd go outside every night and look at the Moon, Jupiter, Mars, Venus, and the Constellation Orion. Of coarse not all are visible all year round and they are in the sky at different time. So when ever I go outside, depending on time and time of the year, I look at those that are present in the sky if its clear enough.

I went outside to have a cigarette at about 11:00pm. I walk out to my car, look up at the Moon, Jupiter, and Orion. I look down and my car door, open the door, and look back up at the sky. Jupiter and the Moon have completely set and only a portion of Orion is now visible! I go through the standard "Holy Shit! What the fuck!?" stage and just stand there completely disoriented and a little dizzy. (How long does it take to open a car door? 3 seconds? 5 seconds?) I bend down and crab my cigs off the seat and light one. Still completely disoriented and dizzy I say to myself "It happened again..." I smoke my cig and go back inside and it's 1:48am. Almost 3 hours are gone and they went by like it was just 3-5 seconds...

Stuff like this used to happen regularly, like multiple times per month from Feb 2008 to September 2011. I've taken showers that I could swear was only 10 minutes but 1.5 hours have gone by and my brother is passed out on the couch (which he never does). Once I was gone for an entire day. I went to bed one night at about 10pm and woke up at about 2am the next night so it was about 28 hours! And on that instance I had my brother ask me where the hell I've been. I sleep with my door cracked open so the AC can come in and my bed is visible from looking through the crack. He asked something to the tune of... "Where the hell have you been!? Your car was here the whole time but you've been gone! And when the hell did you get home!?" I answered "What the hell are you talking about? I just took a nap, it's 2am." He said "Ya you went to sleep WEDNESDAY NIGHT, it's FRIDAY MORNING! Where the f**k have you been!?" I replied "Oh shit..." When stuff like that happens, I tell him the same thing. Either "I don't know, but it's best not to ask.." or just "Don't ask!"

[END OF POST]

A combination of "absence seizure!" plus "reduced activity invisibility" [<https://realityshifters.com/pages/yourstories110.html>]:

I don't know if this is a reality shift but it is weird. My wife is invisible to me at times. It happens frequently. I'll go through the house looking for her then call out and she'll be right there sitting on the couch. She'll think I'm nuts that I didn't see her. I've already been in a room with friends and I'll be talking about her as if she wasn't there and people look at me like I'm nuts and then look at her and suddenly I see her sitting right there in front of me. I think she can relax her mind and go to a real quiet space. It's like she wants to be alone and undisturbed at times. It seems like people in general ignore her or act like she's not there.

POST: Glitches and Chaos Theory

The difficulty with all this is, if we can't directly experience it, then effectively we're still here, just imagining it. Branches and branching are just ways of thinking about possibilities in visual/diagram form and possibilities are themselves just imaginary, if we never experience other branches or the 'branching process'. We only ever experience what actually happens. In fact, we only experience this; what 'happened' is out of reach too. :-/

But it's fun to think about, and maybe in a 'non-material' all-at-once universe we can do something with it.

If we did jump time streams - not to escape death, just to jump to another possibility - what happens to the body we jump out of? Does it continue as a 'zombie' on automatic without our consciousness looking through its eyes? When you walk down the street today, look at the other people, and consider how many of them might be 'dead inside' with their 'viewport occupants' having jumped to nicer alternatives!

Other possibilities:

- We each experience our own dream-world, with cross-dream interaction when things 'match'.
- The universe 'takes everything into account' from the start. If we make a decision, it is re-factored in from the beginning across the whole timeline, all at once.

For the second option:

Imagine being on a particular hill (location and point in time) on a landscape built up from sedimentary layers (time passing). You make a decision that the hill over there should be a different shape. The landscape instantly alters from the lowest sedimentary layer upwards such that this is true. Both your present experience and evidence of the past match your request; you may or may not remember the request.

The whole landscape adjusts such that The universe as a whole is always self-consistent, with memories being consistent and so on, unless a person knowingly make a change, in which case they might retain old-vs-new memories.

I guess it depends on how significant our experiences really are. Are we as important as we think? Experiences only matter because we attach significance to them. I mean ... What makes something that happened 20 years ago any different from something that may happen in the distant future? Well... The answer is that something 20 years ago may affect the future. But still, it's as distant (and probably as unknown) as something from the future. But still, the past and future are both intangible concepts. That's my point. Both are equal, but one is a speculation and the other is a foggy fact. People say the future can't influence the present, but who knows if it can or not. We don't even know how things work. We don't even know what we are. Are the past and the future really that different? What's more "important?" Endless future probabilities or a past set in stone? As humans we like to attach value to everything. "This is real and this isn't." "This means something and this doesn't." Heh...

I guess all of us wonder if other people are even real. I like the idea that everyone is the same consciousness in the end. Every human soul is the universe expressing itself in a different form, tied together. When you think about it, it's quite logical... We're all made from the same stuff, driven by the same forces, experiencing similar desires with overlapping dreams. People feel the need to make a distinction and stress their individualism, for obvious reasons. But I bet there's a way for separate souls to communicate far beyond speech. Wouldn't it be odd if in the end we were all the same consciousness?

I like the same-consciousness idea: waves in the sea, whirlpools in the stream, all the same water, and so on. We place importance on our own experience because it's the only one we have directly really, but there's nothing necessarily stopping us 'reaching down' into the connecting, timeless water beneath the temporary pattern that constitutes ourselves.

For the past, present, future - well, if they're all part of the same thing (the universe, whatever), then the fact we experience moments in sequence is just that, our experience. Actually they all arose at the same instant, and you can imagine that they will be part of the same pattern. Past may not influence future may not influence past, but the whole pattern would be coherent or self-consistent, which would look the same as each taking account of the other.

Perhaps all that really matters is: is reality responsive to our intentions and desires? Does it listen, does it speak to us? If it is made of us and us of it (the whirlpool and the stream), then there is no boundary and our deepest intentions will surely be in line with everyone else's and the flow of the universe overall.

...

Q1: I would like to take a shot at answering your question. Assuming you die in your original timeline and switch what happens to the version of yourself that's already living in that time line?

Let's imagine consciousness as a river ever flowing. When it branches off in to different areas is it the same water is the water connected still? It's the same with consciousness and time. Time split somewhere down the river but it is still connected to the original stream.

If that is the case then when you die in this timeline then you "wake up in the other it's still you there was never a different consciousness. It was always the same one. There is no other version of you that was replaced it was you.

You are infinite in your "being", there are infinite numbers of you experiencing different things at the same time, but it is all being experienced by the same you the same consciousness.

I hope that makes as much since as it did in my head.

TL;DR: Nothing happen to the other version it was you all along.

Okay, I am 'infinite in my being', but I still seem to be looking through one particular "viewport". Are the other versions of me just 'zombies', acting automatically but without anything 'looking out' through their eyes? When I look around, how many of these other people are 'zombies' too? How can i tell the difference?

(I tried to explore this in a post a while back, with the idea of "extended persons" and "parallel experiences", but it's pretty hard to connect the parts persuasively into a coherent picture.)

I like to think of it like information sent over the internet. Take email for example, when you write it, it is whole. After you send that email it is broken down in to packets which then are sent but don't all take the same path. If one packet of information is intercepted in transit then you can read a small piece of information. Think of these paths as time and the email as "You" when you began you were whole then time split and each line got a different packet of you with information as to "What/who" you are. Like the email when it gets to its destination it becomes whole again. If there are a finite number of time streams in which you exist then this would explain the N.E.D. people experience sometime.

Edit: Not zombies its just part of the packet experiencing one line of transit to the finial destination. Think of it as one packet of information in the email reaches its end point and jumps to the next packet in line until all packets have reached the end.

By 'zombies' I mean 'philosophical zombies', note.

Interesting idea. From a personal perspective though, there still only ever seems to be one 'me' in one 'place'. However, I guess this is similar to the conception of 'God' where God is all things, or the 'one thing', but fragmented into numerous viewpoints (waves in ocean analogy).

[QUOTE]

Philosophical zombie:
A **philosophical zombie** or **p-zombie** in the philosophy of mind and perception is a hypothetical being that is indistinguishable from a normal human being except in that it lacks conscious experience, qualia, or sentience. For example, a philosophical zombie could be poked with a sharp object, and not feel any pain sensation, but yet, behave exactly as if it does feel pain (it may say "ouch" and recoil from the stimulus, or tell us that it is in intense pain). The notion of a philosophical zombie is used mainly in thought experiments intended to support arguments (often called "zombie arguments") against forms of physicalism such as materialism, behaviorism and functionalism. Physicalism is the idea that all aspects of human nature can be explained by physical means: specifically, all aspects of human nature and perception can be explained from a neurobiological standpoint. Some philosophers, like David Chalmers, argue that since a zombie is defined as physiologically indistinguishable from human beings, even its logical possibility would be a sound refutation of physicalism. However, physicalists like Daniel Dennett counter that Chalmers's physiological zombies are logically incoherent and thus impossible.

[END OF QUOTE]

I like that idea; waves in an ocean.

Yeah, it's a current favourite of mine.

If you ever feel appropriately motivated, I've just been reading this guy's (Bernardo Kastrup) new book on idealism (that everything is made from mind; there's no 'stuff' separating us). His main metaphor: we are like whirlpools in the water, made of the same stuff, connected, and yet individual too. Like the answer to the question: if we were in The Matrix, what would 'The Matrix' be made from'? Quite accessible, as these books go; check it out.

That and the cheesy story from the start of Illusions by Richard Bach about letting go:

"The Master answered and said "Once there lived a village of creatures along the bottom of a great crystal river... continued
[https://en.wikiquote.org/wiki/Richard_Bach#Illusions_:The_Adventures_of_a_Reluctant_Messiah.281977.29]"

Consciousness can't be created or destroyed because of conservation of energy. It's all linked to the source of consciousness and goes on somewhere else. Whether it be at the source once again or in a new life or reality depending upon what the consciousness has decided to do. Sort of like dying in WoW you can choose to restart or begin again or create a new character with better talents etc. That's what I think.

Respawn! Nice. I'm looking forward to that then. Only, if I am consciousness having a 'TriumphantGeorge' experience, when I die, I won't be 'me' anymore I suppose? My 'character' will be gone, as I think of it.

Q2: My take would be that there are not parallel worlds of all possibilities, but potential possibilities. That being said, we need to remember that time is not linear as we experience it. So, maybe if you wake up in another world, that world hasnt been fully actualized with you until you are in it. i am probably not making sense. I would say a tree does NOT make noise falling if no one is around to hear it

So, each of us is effectively having a 'personal dream-world' type experience?

Q2: In a basic sense, ya

So, time is linear as we remember it - because we only have one set of personal memories. If I 'jump worlds', really all that has happened is that there is a discontinuity: that my most recent memory and my current experience are at odds.

We might say that we 'branched off', but really we never see a branch, we just see that our present moment has changed quite a bit. We might think of there being a 'dead me or another me on the branch I left', but really that's just us imagining things - a way of explaining making choices to ourselves.

(It's more plausible that we're dealing with a shared dream where all choices have been taken into account...)

POST: I vaguely recall Verne Troyer dying a few years ago. I thought about it and realized it was Gary Coleman, even though i was pretty sure both did. Instead of saying i "switched universes" or some shit like that, I accepted that I probably remembered wrong. A lot of you need to do the same.

I always thought of this sub as a tongue-in-cheek way of presenting weird experiences. I didn't think people were actually taking the idea seriously that we are transferring between universes.

A lot of the "fun" of the thread is that it has a slightly jokey banter - hey check this weird experience and the responses. However, lots of people do seem to have real jumps that occur to them that go beyond this, and most people seem fairly sincere when they post.

"Seizure!" or forgetfulness or distraction or confusion is probably the usual explanation, but you can rarely prove this - and the real point is that the experience is personally meaningful in a way that seems beyond likelihood.

The main problem here is that there are too many trigger-happy submissions to this forum; the quality bar is becoming pretty low! Over at the your stories section of Reality Shifters, stories are added more slowly, and I'd say about a quarter of them are worth thinking further about. (i.e. Even if we assume no 'paranormal/parallel' aspect, there is something interesting going on, and there is enough detail that the usual explain-awayers can't be applied.) A much lower number applies here!

Q1: A lot of people on here actually believe their life has "glitched" at some point. For a large part yes most things are just major coincidences or brain fuck-ups but alternate reality theory (or whatever its called, multiverse) is actually something that people believe and its not that crazy. (I don't really, i just like the stories).

Q2: It's not that I find alternate realities crazy. I am at least familiar enough with quantum mechanics to understand the possibility to be quite within the realm of believability. I just doubt that transitions between them occur that easily or frequently.

Q1: I agree. But it could happen constantly and we'd never know. It's difficult to translate my thoughts to text especially on my phone. I think we're on the same page though.

I think I get you.

You don't need quantum mechanics, you just need some form of idealism (the idea that what we perceive is fundamental, there is no secret 'solid stuff' hiding behind the scenes, there are no divisions of parts to the universe).

If there are jumps, then these are jumps of the whole universe, at once. If the jumps are self-consistent, then the memories post-jump will corresponds to the details of the post-jump universe - nobody will ever know. There will be no trace of the previous format of the universe, because where would that be stored and how could it be accessed? Could be happening all the time.

If someone were to discover how to cause a jump, they might retain the pre-memory - because they remember the action, the 'doing' - whereas everyone else would be re-aligned to the new version. Perhaps this is what 'magick' is. (And if we're all accidentally doing this, bringing the universe in line with what we want, then we'll all be getting incredible coincidences at least occasionally, not realising we're causing them.)

Q3: Why even come to this sub then? For a lot of people it's interesting to entertain the idea of possibilities like the ones presented on this sub, even if they don't fit into your understanding of reality. What is reality and who are you to define it, anyways? What are your credentials?
Instead, your statement comes off as condescending in a really narrow-minded and immature sort of way, like you're trying too hard to convince us (or probably yourself) how much you've got it all figured out. Why not just lighten up and enjoy the sub for what it is? I mean, did you really expect to find some sort of proof of deeper truths here or something?
Part of what makes things like this sub and the paranormal in general fun is having an imagination -- you might want to try it sometime.

Q2: You couldn't be more wrong. I just want people to think before they post because of the high percentage of shit on here lately. (I unsubscribed about a week ago actually). I love reading about actual strange/unexplainable things that happen to people. Not "i thought x was dead" or "i couldnt find my clothes, but then i found them righy where i left them!" Or just simple coincidences. Or computer glitches.

Super-agreed.

"I couldn't see my eyes, I looked for them all day, and when I eventually found them they were in the other mirror, not the one I last saw them in!"

POST: one way to get whatever i want

Thinking the opposite of something, with intensity, is the same as thinking of something. You can't actually think of an absence: you end up with the thing, plus some modifier like "not" beside it. The Matrix don't listen to no negative bits, it's all 1s no zeros. Agent Smith likes to toy with you, remember.

You might find this thread [POST: What was the most Epic Fail you ever had from a spell that actually worked?] and this thread [Dramatic Effects] interesting. You should post more examples!

POST: The day our two hour drive became a ten minute drive

[POST]

Hello everyone! Here's a weird driving glitch that happened to me and my husband back in 2005.
We were leaving Lubbock, Texas. Our drive home would take 2 hours. We'd driven this many, many times over many years. There are lots of small towns in between and just no way to make the drive any shorter.
We'd called the kids to say that we'd be home around 4:30 P.M. It was now around 2:15 P.M.
After we called the kids, we stopped at a cute little grocery store. We browsed every aisle and picked up some snacks for the road. We were completely content to take our time and enjoy the drive.
We also stopped at about the halfway point to fill up on gas because the prices were so much better than what we knew they were at home.
The drive itself was very peaceful. The day was beautiful and we were content to enjoy each other's company and the road trip and overall everything was very, very pleasant.
(side note: our vehicle was older back then and would show the radio station number when the radio was on. It would show the time if the radio was off. We had the radio on the whole time.)
I remember small chit-chat and eating some of the homemade beef jerky we'd picked up. Otherwise, the drive was uneventful and seemed typical with the usual amount of traffic.
As we pulled into the driveway, I switched the radio off to check the time.
It was 2:25 P.M.
I was very surprised, but also very sure that the car clock had messed up somehow. I asked my husband what time it was.
He looked at his watch, looked at me, looked at the car clock and then back at his watch.
He said it was 2:25 P.M.
We were both in shock, but told each other that somehow his watch and car clock had messed up at the same time.
We went in the house and checked the time. It was now 2:26 P.M.
The kids were surprised to see us so soon, but quickly brushed it off to 'parents being weird'.
My husband and I talked through the whole trip over and over.
We'd spent the day in Lubbock shopping. We'd stopped for lunch around 1 P.M. to miss the bulk of the lunch crowd. We'd headed home after lunch.
We KNEW it was 2:15 P.M. when we started the trip home. We KNEW the drive would take 2 hours. We KNEW we'd stopped TWICE along the way and should have gotten home very close to 4:30 P.M.
We've never come up with explanation.
EDIT: TL;DR: Drive should had taken 2 hours. Hubby and I called the kids to say we were on our way home. We got home 10 minutes later, much to everyone's surprise.

[END OF POST]

Q1: You read 12 as 02 twice. Happens.

Q2: Occam's Razor prevails.

I don't think that's quite how Occam's Razor works... it's to do with choosing between two models with equal explanatory power, and choosing the one with the smaller number of conceptual entities - it's not just "I can dismiss it as you made a mistake". Especially when, as most often is the case, it doesn't address the actual post, instead offering a little parallel story instead.

Which isn't to say it's some sort of time jump either, of course. But "brain went funny" or "saw things wrong" isn't an explanation either; it's a content-free retort.

You make a valid point, but others were leaning towards the possibility of a wormhole as the explanation for this glitch. I figured, since misreading the time is something that sometimes occurs for me, it must have been what happened in this story. Not the totally extraordinary possibility that OP can pseudo-timetravel.

Yeah, there's sometimes a tendency to see everything as falling into one camp or the other here. Either it is presumed that a story is an example of (say) time travel, or it is presumed that not accepting a handwaving reference to (say) "memory is fallible" is a vote for time travel.

The underlying assumptions are that: a) there exists an explanation, and: b) the post contains sufficient information to reach that explanation. Neither are necessarily true.

By the first one I mean that an "explanation" exists as a human construct, a narrative fiction, rather than something out there in the world - and it's not necessarily true that one can be formulated. And if it can't be "tested" - via thinking through the events in these cases - because there's insufficient detail, it's hard to see how it's an explanation at all. When the explanations offered amount to a naming and categorisation (such-and-such a cognitive bias, beyond its applicability), or a broad generalisation (memory is

fallible, brains are glitchy), then they're essentially worthless.

So far as they remember from 10 years ago. Without the hard evidence of the receipt from the store, we really don't have anything to work with.

Okay, so the actual answer is surely: we don't know what happened, it's an open verdict? (Note: and by open verdict, I don't mean "keeping it open because it might still be time jump. I just mean we shouldn't confuse explaining away with having an actual explanation.)

Nope, its a pretty clear cut case of an anacdotal story from a false memory. We have multiple options for what happened that don't involve breaking physics, can't say which it is due to the 10 year time gap, but we can be confident it wasn't a time jump.

So... as I said, I wasn't suggesting it was a time jump. However, we can't say it's a false memory either (which has a specific meaning and context), if 'we're going to hold ourselves up to a high standard.

Of course, this depends on what we're after here. If we're trying to scientifically (in the proper sense of the term) "prove a glitch" - and if what we mean by "a glitch" is that the "laws of physics" were broken - then obviously we're going to be out of luck. Life is anecdotes, and the reports on this subreddit have already happened, usually in everyday life, and never in a controlled environment. The gas station receipt could have been explained away also, if it had been part of the original story, it would just have added another layer to our "confusion and coincidences" narrative.

POST: [META] John McAfee plays Russian Roulette

[POST]

I read this article in Wired a while back and since then I've been scratching my head over what it describes... specifically John McAfee's "Russian Roulette" demonstrations. Here's the article:
[<http://www.wired.com/2012/12/ff-john-mcafees-last-stand/>]
Here are some choice quotes:
He keeps his eyes fixed on me and pulls the trigger a fifth time. Still nothing. With the gun still to his head, he starts pulling the trigger incessantly. “I can do this all day long,” he says to the sound of the hammer clicking. “I can do this a thousand times. Ten thousand times. Nothing will ever happen. Why? Because you have missed something. You are operating on an assumption about reality that is wrong.”
...
“Let’s do this one more time,” he says, and puts it to his head. Another round of Russian roulette. Just as before, he pulls the trigger repeatedly, the cylinder rotates, the hammer comes down, and nothing happens. “It is a real gun. It has a real bullet in one chamber,” he says. And yet, he points out, my assumptions have somehow proven faulty. I’m missing something.
The same is true, he argues, with Carmelita. I’m not seeing the world as he sees it. He opens the door to the bungalow, aims the gun at the sand outside, and pulls the trigger. This time, a gunshot punctures the sound of the wind and waves. “You thought you were creating your reality,” he says. “You were not. I was.”
The way I see it, there are a few possibilities here:

- The reporter is outright fabricating these events,
- The reporter is exaggerating what happened,
- John McAfee used some sort of trick to fool the reporter (maybe he secretly had the safety on?),
- Quantum Suicide is real and we happen to live in the universe where John McAfee doesn't blow his brains out,
- John McAfee is somehow "creating our reality." (???)
So... I put it to you, good citizens of /r/Glitch_in_the_Matrix: what the fuck is going on?

[END OF POST]

John McAfee is somehow "creating our reality."

I quite like this as an interpretation (for fun), because it's reminiscent of a Philip K Dick story style, perhaps Eye in the Sky in particular. Are we in fact all living out our lives in the last few moments of the mind of John McAfee, in the aftermath of a virus scanner error which resulted in a devastating nuclear accident?

See also: Ursula K. Le Guin's novel The Lathe of Heaven and the associated PBS film adaptation.

Maybe he read those too.

POST: A New Dimension of Thought

I'd be a bit cautious of the "computer software" metaphor when it comes to brains and (really what we're talking about) mind, but it's certainly good to indulge in a bit of introspection and to directly attend to experience. Specifically, noting the content and nature of our actual experiences as they arise, and deconstructing the descriptions we tend to use - which often don't correspond to the direct experience very well at all.

For instance, in what sense do you actually experience "your brain" at all? Do you even really experience "remembering" as such? What leads you to think that there are "programs" that are "running in the background"? The background of what, precisely? And when you are introspecting, where and what exactly is the "me" that is doing the observing?

All good fun.

POST: [deleted by user]

Hello! So, I think that what we often really mean by saying that the world is a "dream", is that it has no solid underlying substrate that can ever be experienced - which therefore means it effectively doesn't have one. Calling the world a "simulation" and so on, is really just a currently fashionable way of formulating that older idea, using modern metaphors of "information" and "programs". (And in common with other metaphors, a problem with the simulation metaphor is that it gives the sense that the world is being "run" as a process and is dynamic, in an objective way and dependent on something external. This arises because we assume that the 3D-spatio-temporal formatting of our experience is a property of the world itself. It's perhaps more accurate to say the world is being "explored", and it is logically static but perhaps modifiable.)

Similarly, when we say that we are a "soul", that's a way of trying to articulate the nature of our direct experience, which I'd suggest might be best described as an "open aware perceptual space" in which our experiences arise. If we pause a moment and attend to what we are actually experiencing right now, we can recognise this for ourselves: we discover that it is indeed like we are a "space" in which our bodily sensations float, fading in and out, with a visual image floating in front of us, and sounds floating here and there. There might be a particular "feeling" sensation which we tend to call "me" - typically a small spot somewhere behind the eyes - but that location is inside our overall perception, so it obviously cannot be us. It's just a reference point. Note that this direct experience is different from how we think about ourselves, which is as "a body walking around in a 3D environment, with an associated personality" - a human inside a world. Our actual experience is of being "that which perceives", within which sensations and perceptions and thoughts arise - a world inside us. Looping back around to dreams and glitches, then, a "glitch" becomes just a discontinuity in our ongoing experience. The idea that "the world" has shifted is something we infer from our own concepts about the world, via our parallel constructions in thought, just like any other explanation. The nature of experience itself, however, remains a complete mystery, in the sense that it can be known but it can never be understood. Our explanations place no restrictions on what can be experienced. Although we sometimes forget it, our descriptions are merely connective fictions which summarise the observations catalogued so far; they are in no way "what is really going on". In other words:

- Observations dictate the validity of models.
- Models do not dictate the validity of observations.
- No underlying substrate will ever be experienced.

Although there may be some overlap or feedback here between the models we adopt and the observations we are funnelled towards as a result.. This would have implications in terms of the stability of one's ongoing experience, and the potential to deliberately create a glitch?

...

Don't poke holes in the screen, it took an eternity to get those dimensions all lined up! I dunno, nothing specific on reading material - and it's just one take on it I've got obviously - but maybe George Berkeley's Three Dialogues for some retro thought-provoking stuff?

I do struggle a bit to recommend specific reading, since as is the way of these things, you come to your own view and everything else is "yes, but". And a lot of where you end up is a result of having lots of thoughtful conversations. Most of the reading that got me thinking was more philosophy/science stuff, plus models of memory and perception, mixed in with some more esoteric things. At the end though, you see all that stuff as metaphors, parallel constructions.

Okay, let's see...

The underlying thing, then, is about having a certain direct experience though. When I say "open aware perceptual space" I mean that you literally can experience yourself as that, if you pay attention. And having done so, the relationship between the nature of experience and the content of experience makes sense on a direct, intuitive level. If you're looking for books which discuss and lead you through that, Rupert Spira's Presence I & II are probably about the best written descriptions. (Ignore the fluffy language on the covers, the actual content is pretty streamlined one you get past the introduction: see sample chapter.)

If you like a science starting point, then N David Mermin's What's bad about this habit essay is worth a read, as is his introduction to QBism. Also on the science and philosophy front, I'd recommend Julian Barbour's The End of Time and David Bohm's Wholeness and the Implicate Order. Also, more in terms of the thinking about thinking, Paul Feyerabend's Against Method and Farewell to Reason are great but a bit dense - his unfinished Conquest of Abundance is more accessible and gives a flavour though. (And if that all sounds too grim, I still recommend his autobiography, Killing Time.)

...

*A1: I believe this too. And we're not the only ones.
"To live is to sleep, to die is to awaken"
And,
My grandmother used to recite this rhyme:
Row, row, row your boat
Gently down the stream.
Merrily, merrily, merrily, merrily,
Life is but a dream.*

*A2: It is not true, it is not true
That we come on this earth to live
We come only to sleep, only to dream
-old Aztec poem*

POST: Question for those who have gone through near death experiences

[COMMENT]

I have had a near death experience. I was in a head-on collision going 65-75 mph down a two lane road. The other car hit us on my side (passenger side) and the car was totaled. Looking at the photos I don't know how I lived. Somehow I walked away with whiplash and a broken toe. But moments before the accident, I saw a large yellow and green glow in front of us. I even said "hey what's going on up there" but my bf that was driving didn't see anything. It was just this feeling like the site of the crash had energy already there. Coincidentally (or not?) we were listening to the Jack Johnson song Country Road, about a "head on collision on a two lane country road" at the time and the song was the last thing I remember before I blacked out. My bf remembers everything, hitting the car, the noise it made, even the spinning of the car after we hit. But I didn't become conscious again until after the the airbags deployed and I "woke up" to the voice of the on star woman. My bf was completely ok but I was so disoriented. I went to the hospital and got everything checked out but somehow I felt that I had died. I have this vague memory of dying and then looking at my life and choosing to go back. Like I felt I had more to do here and wasn't ready to leave. I can even remember conversations with other beings about whether I should go back. The memories seems to fit into the timeline of my blackout, but it doesn't really make sense that way because what I had experienced had no time, at least how like I know it here. I have always been intuitive and had seen many apparitions, "glitches", deja vu and other paranormal experiences when I was a kid. And since have been fascinated with clairvoyance and the like. Studied energy healing, etc. This near death experience only validated my belief in a spiritual reality outside of our limited perspective. If you are experiencing these things, I wonder if you also had made a decision to come back but just with more awareness. Do you remember anything like this?

[END OF COMMENT]

Q1: This is incredible, thank you for sharing! I think you're absolutely right about me consciously deciding to come back with more awareness. You hit the nail on the head. After I was hit the only thing I remember is everything going black and having the thought of "I'm really hurt right now but I'm here, I'm alive, everything's going to be okay." I never had any moments where I connected with other beings or had any vivid images, it was just black, but I did receive some kind of message saying that I would be fine. When I was young I didn't have any paranormal experiences, except I do have a vague memory of seeing the number 11 a lot when I was going through puberty (around the age of 12). The appearance of the number 11 came back in full force after my accident, and has been a guide post for my life journey if that makes any sense at all. Thanks for sharing your story and allowing me to gain some insight into mine!

Q2: 1's, and specifically 11:11 is most closely associated with a forthcoming positive awakening. A blossoming, if you will. It makes sense that you'd be surrounded by it at a time of your coming into physical maturity and now your coming into spiritual maturity. This is a bit of synchronicity for me, too. I was just reading about the significance of 1's this morning. I've learned to understand these things as road signs that you're on the right track and everything is okay.

Although - sometimes having an 11:11 pattern sounds like a real pain.

Personally, I do not think such "pattern overlays" have any inherent meaning other than the fact there is a patterning effect - plus whatever meaningful associations you gain from them yourself. Some unfortunate people get obsessed a pattern and it begins to dominate their life to a scary extent (the patterns needn't necessarily be numbers, they can also be full-on scenarios), and end up having a very tough time. See this interview with Kirby Surprise, for examples [<https://www.youtube.com/watch?v=2-iMw9KA93U>].

TriumphantGeorge Compendium - Part 24

POST: 11:11 -the numbers in my life for over 25 years

[POST]

I want to preface this by saying I have heard every established theory on this from "you are subconsciously prompting yourself to look at a clock" to "it is the gateway opening of the age of Aquarius and we must dress in white robes and do a dance in Ireland." Nothing fits, nothing helps. I am very much a skeptic and although I always keep an open mind, I also first seek the most rational explanation to anything. If you can accept I don't take these things lightly, read on. It started very simply. I saw 11:11 on the clock and thought something about seemed interesting. I don't know what. A mirror of 2 numbers? Four towers? I can't say, but everyone has bombarded me with these explanations. All I know is, I noticed it and something felt odd about it. And then I saw it again. And again. and again. Eventually, it was happening with such frequency that I can honestly say I started to think it was alarming. Why was I seeing this? Well, I shrugged it off nonetheless. After a year of this, I made a new friend who is still the closest friend I have to this day. We go beyond friends, beyond family. One day she timidly asked me if I had ever heard of anyone seeing 11:11 on the clock repeatedly. Needless to say, the hairs on the back of my neck stood up. Over the course of I'd say 5 years, we both saw it with alarming regularity. But we both came to the same conclusion; it doesn't mean anything at all but rather we are very aware of time and we are subconsciously prompting ourselves to look when it's 11:11. That makes a lot of sense, really, because many times when I set me alarm to wake up early, I will wake up a minute or two before the alarm goes off. Subconsciously, we all have an internal clock, so it makes sense that we were just making ourselves see it. That explanation satisfied us for many years. And then it got harder to deny. Several years later, after life took us in separate directions, I was living on the whole other end of the state. A few years in, I was rummaging around in my closet and found a wristwatch of mine I had misplaced months before. It had wound down and was not running any more. I squinted to look in surprise. It had stopped at 11:11:11. Precisely. I also lived alone, and was not in the habit of telling anyone about what I saw, so I don't see that anyone else could have done such a thing. The only person who knew was many miles away and had been since before I bought the watch. But, I still shrugged it off. I was driving down the street one night and the local bank had a digital sign that displayed the time. This night, it read 11:11. I chuckled and then my eyes darted to the clock on my car. It was 8:24. I can totally see the clock breaking. It could even blink 12:00 like an old VCR after a power outage. But 11:11? Why? About 8 years ago I sat with a dear friend in Denny's at the wee hours of the morning. The place was empty except for us and the staff. I told him all my stories about 11:11 as we were swapping strange life experiences. He was dubious, of course, and offered the "subconscious prompting" explanation as most people do but I explained too many instances were piling up that I had no power to influence. He chuckled and shrugged it off. Well, sadly he has passed on since then. He had a variety of illnesses, not the least of which was ketoacidosis which finally claimed his life. As a result of his illnesses, he always had to rush to the restroom after meals and this time was no different. I had already paid the check so I said I'd go with him. On the way, I stopped dead in my tracks and grabbed his shirt. "Look at THAT" I said. There, on the wall, the wall we were both looking at from our tables, the wall NO ONE had gone near while we were in there, was a wall full of graffiti all saying the same thing. 11:11, 11:11, 11:11. "Did I subconsciously write that with my mind or did I subconsciously prompt us to visit the only place in the area with this on the wall," I teased. That was the first time he took it seriously. A couple of years ago or so I had the experience that frightened me. I had moved a bunch of stuff out of my office when I moved out of it and frankly left some of it lingering around the back of my car for about a year. Lazy, sure, but that doesn't matter. What matters is I had a large digital clock in there that had been on my desk. One day I opened the trunk and saw it. It was face down. I laughed inwardly. "You know if you turn it over what it will say, right?" I teased myself. I really didn't believe it, though. And then I picked it up. To my relief, it was blinking 12:00 like any good clock should when it's not properly set. I heaved a sigh of relief. And with that, the alarm on it suddenly rang and the numbers changed to 11:11 11:11 11:11. And then -it powered off, dead, never to work again. Let me say, with all of the grace and dignity I can muster, that I nearly shit my pants. That's not something I can prompt. That's not something I influenced. It was here, in my hands, happening independently of me. a bit over 3 years ago, my mother fell terribly ill. Turned out to be a massive tumor outside her brain in the netting that holds the brain in place, called the Meninges. (The cancer is called a Meningioma). The surgery went awry, and after an emergency second surgery to relieve an infection, she has been left an invalid, barely able to form sentences. It's very sad, let's not go there. But the reason I bring this is up is because a few weeks ago I was visiting her and she kept repeating "one." "one." "one." "one." I asked her nurse what this was all about and she smiled. "Oh, she must have seen the clock. She has this thing where she keeps seeing 11:11 on the clock." Mom smiled and managed a "yes!" And of course my blood ran cold. I had never told her about this. So what conclusion can I draw? I saw it earlier today and I saw it again last night. Is the universe trying to tell me something? Maybe, but if so, it really, really sucks at it and if the universe has this capability it might just resort to words as that would be a lot more expressive. But this is all I get. 11:11. I'd say about maybe around 2003-ish, I had decided to poke around on the net and see if anyone else had ever seen this. To my shock, I found millions of people had. Alas, they had no better explanation than I. "It means it's time to make a wish!" Hogwash. "It means the angels are with you." Preposterous. My favorite has to be on a website called Solara the Nvisible which talked about elaborate druidic dances called "master cylinders" (isn't that a car part lol?) and all of this aerie faerie stuff. Not a shred of hope of answers from that lot. And obviously I completely reject the subconscious prompting notion to say nothing of the pure coincidence idea. No way I can have this many coincidences over this many years. But that clock in my car. It made me think. I drove on my way and mulled it over. I cannot have affected that clock in any way that could produce that effect upon lifting it. This was external to myself. I cannot have used the psychic powers I don't have -I don't believe anyone has them, it's just wishful thinking. So how do I explain it? The unavoidable answer is that nothing is real. That somehow an external force can affect reality and is doing it for others and for me. Well, what the fuck does THAT mean? I don't believe in gods. I cannot say I completely disbelieve in psychics, I suppose, only because I myself have had too many experiences where I have known the unknowable right before it happened -but that is another glitch report. But no matter what else I've experienced, I am certainly not going to believe someone was using mind-powers to do this to me. Not rational. It was a glitch in the matrix. A sign that the impossible was possible because that should never have been able to happen -but it did, just the same. Now, mind you, I don't go around thinking "nothing is real and we're in the matrix." What I mean to say is that I can think of no better explanation to fit the facts -but I still reject it. There has to be a better theory but no amount of "you're doing it yourself" or "dance the master cylinder" is going to work for me either. At this time I have to say I have no theory I firmly believe but will always, always be looking for one. I'm not prone to hallucinating, most of these have been corroborated by other witnesses, and I certainly didn't dream it all. And the examples I have given here are a drop in the bucket for a nearly 30 year long experience. All I really can say is I don't know what it is -but it's something and it doesn't happen for no reason. I am just unwilling to give a pat answer just to satisfy myself. I will keep wondering and looking and thinking. And no doubt, I will keep seeing it.

[END OF POST]

Self-reinforcing synchronicity. The more it happens, the more you decide to attend to it, the deeper the impression, the more you are mind-formatting your reality. There's no inherent meaning; but it does reveal something interesting about the nature of experience eh.

See also The Patterning of Experience.

You clearly only skimmed what I wrote. But thank you for proposing the same tired theory I've heard for decades that has no bearing on the evidence I submitted. I sort of expected this.

No, you clearly only skimmed. What I describe isn't Bader-Meinhoff or the like. By "formatting your mind" I don't mean you are pattern-searching. You are not filtering experience from what is there; you are filtering experience from all possibilities. Read it properly before moping or thinking you're special. ;-)

I adjusted the link phrasing a little to make that clearer.

I'm neither moping nor special. in fact, bringing up a theory someone has heard a thousand times before makes you the one who thinks they've hit on something special and original! It doesn't fit my experiences. But thanks for the suggestion. Again.

Really, so what is the theory I'm proposing? You definitely didn't read those links. I'm suggesting that you have accidentally selected your future events according to a pattern, formatted your own future path, to an extreme degree. There is no power outside of you making it happen. The more you encounter a pattern, the more you notice a pattern, the stronger the selection is. The pattern affects things 4-dimensionally, even though you only encounter it one moment at a time. You end up looking around just at the exact moment a pattern is there. Reading material and conversations are centred around the pattern. Actually are centred around the pattern - it's not just a case of you noticing. Numbers are the easily recognised one, but any pattern or relationship behaves the same way, once you get into it.

The implication? That your experiences and thoughts actually select your later experiences. The inevitable conclusion is that you to some extent live in your own private universe - a subjective idealist reality - which is effectively an extension to your own mind. And the more you focus, the more you end up in situations which give you more of the same. You might find this interview with Kirby Surprise (great name) interesting. His book Synchronicity is probably the only one worth reading on the topic.

EDIT: Seriously, I don't mean to be snippy. What you are experiencing is what genuine full-effect synchronicity looks like. I've been generating it deliberately lately. It's like cutting a whole in your reality filter and suddenly new sets of events, new parts of the universe, manage to leak through.

Look, when I tell you I know these theories already, I'm not putting it lightly. I don't believe in the synchronicity thing and I see no rational evidence anywhere that I have any ability to influence future events. This requires an almost supernatural belief in things that can't be proven. I do appreciate the attempt, believe me, but it doesnt work for me.

Well, synchronicity is maybe not a great term for it, given its misuse these days, but there's not really a better term I'm aware of. By synchronicity I mean "collections of experiences arising over time which are of the same pattern". And it's not an explanation, it's an observation of a pattern.

Look, I've tried everything in this area too and after experimenting with it, and as far as I can see any useable model requires that we introduce some temporal landscape concept. Although we experience things moment-by-moment, that's not how it's laid out behind the scenes.

I know:

- It's not hallucination.
- If you deliberately attempt to create synchronicity, you can.
- It seems like pattern-selection in a 4D environment.

It's not supernatural. It's not God. It's not other beings. It's not a simulation. It's not "you" in the sense of making deliberate choices. It's not influencing future events as such. It's more like simple, mechanical, automatic perceptual pattern filtering across space-time.

I'm not downvoting. Never do. And I see you took this personally.

To me it's just an interesting phenomenon that most people have to some extent, and it seems we can deliberately increase its occurrence (and I've been getting people to do that). I guess it's been a bit more meaningful in your life than that - so perhaps I seemed offhand and disrespectful. Apologies if so (sincerely).

Ok, show me the scientific evidence that this sentence is true.

As you'll have noticed, there is no way to measure this objectively other than through the experiences of people, so designing a study is problematic (I've considered doing this). At the moment it's restricted to personal investigation. But, why don't you (by which I mean "everyone") do your own experimentation? It's easy to do. Choose a particular pattern, get really absorbed in it, notice how it appears in ways that can't be explained by just noticing stuff, notice how it is self-reinforcing. The best fit so far that fits the experience and isn't "the matrix did it" is there is some filtering process going on. Others (Dr Surprise) have proposed that a model based on string theory might be able to account for it in principle because it can take in the higher dimensional component. I find it a bit of a stretch, personally.

I'm not ignoring you, I have to dash out for awhile. I will adress further posts of yours later. Look, I dont want to make an enemy of you and I have no wish to fight or have it devolve into insults as happens too often on reddit. I just see it differently. I can get that you can make a self-fulfilling prophecy. The man who is convinced he is going to die will find a way to make it happen. Look at Jim Carey. Wrote himself a check for a million or something and kept it in his wallet, believing one day it would be real, one day he'd have a success big enough to match it. And then he did. He claims it was synchronicity. I say he gave himself the confidence and that confidence made the difference. But that's totally different than affecting electronic devices or graffiti on walls. Anyway, Im open to talk, but when I return.

Yeah, that's why "synchronicity" has become a difficult word for this, it's got all these connotations. What I'm using it to describe is just the basic observation:

Similar patterns arise repeatedly over time, in both thought and senses, in ways that seem unconnected except that they have the same pattern. The "matrix" explanation does have the idea we need, which is: That behind the moment-by-moment sensory experience we have, there's a larger world. This doesn't need to be some supernatural or computer based thing, though. Philosophers have previously suggested views that offer the same essential idea (Immanuel Kant, to an extent George Berkeley, etc). The basic idea being:

- There is the world as it really is.
- There is our experience of the world.
- The form of our experience isn't necessarily the same as the world as it truly is.

In Kant's description (here's an okay summary here [https://web.archive.org/web/20130516095302/http://philosophynow.org/issues/95/Kant_at_the_Bar_Transcendental_Idealism_in_Daily_Life]), things like space and time are part of the senses. It is the mind that formats the world into "spaces" and "moments". The world as it is, is all-at-once and everything-everywhere. Just a load of "facts" dissolved into the background.

From Wikipedia:

The salient element here is that space and time, rather than being real things-in-themselves or empirically mediated appearances (German: Erscheinungen), are the very forms of intuition (German: Anschauung) by which we must perceive objects. They are hence neither to be considered properties that we may attribute to objects in perceiving them, nor substantial entities of themselves. They are in that sense subjective, yet necessary, preconditions of any given object insofar as this object is an appearance and not a thing-in-itself. Humans necessarily perceive objects as located in space and in time. This condition of experience is part of what it means for a human to cognize an object, to perceive and understand it as something both spatial and temporal. . . .Kant's view is better characterized as a two-aspect theory, where noumena [world as it is] and phenomena [world as sensed] refer to complementary ways of considering an object.
-- Transcendental Idealism, Wikipedia

This opens the possibility that just as patterns arise across a spatial environment and our mind picks them out (that's what seeing objects really is), so patterns can appear across time and our mind picks them out (that's what events are). Most of the assumptions we make about our perception being direct are obviously wrong but we never really notice. It's only when "crazy things" seem to happen that we realise there must be more going on. That applies to spatial environments - can the same be true of the 'temporal environment'?

Are we effectively pre-filtering "moments of experience" that correspond to patterns? We don't do this deliberately though, it's just an automatic thing. The more you are exposed to a pattern, the more your "perceptual filter" lets that in. The illusion of time passing makes us think that it's a miracle. In a way, saying "it's the matrix" isn't all that bad if what we're really saying is: The universe is actually made from dimensionless information, and we navigate it by pattern searching. We don't cause the future, it's just a natural filtering mechanism that makes it seem to line up.

EDIT: Just to add, the idea behind this subreddit is to "explore together" to find interesting and useful explanations for odd things, whether based on current knowledge or left-field thinking. Very few people are here just to be "right". Most are just here to be interested/ing.

If that were possible, I could have altered reality hundreds of times in my favor.

Yeah, I'm with you there.

You can filter your experiences that correspond to your thoughts (it seems) - and unlikely examples might then take place - but that's not the same as creating them. You are just filtering what's already there. I've played quite a lot with trying to make things happen. You can make your life appear to fit patterns, but that's different to summoning a nice new Ferrari out of thin air. I do see owls everywhere though.

...

I got really beat up for making this post and I just assumed it was more of the same.

Actually, I think everyone loved the post. They just didn't like your approach towards their discussion.

For glitches, by definition, there is no scientific theory yet, perhaps because we need some new concepts, perhaps because they're hard to study in a controlled environment. Sometimes all we have is 'rational philosophy' (which is what physics came from, after all). Everyone in this subreddit is just exploring possible ideas, bouncing ideas off each other. It's not "all about OP".

In my case, you mistook a rational metaphysical idea (which has roots in established philosophy) as being a non-rational spiritual one, and then gave it some major attitude. You don't have to like an idea, but the point here is to discuss it ("that doesn't work for me because..." or "what about this?") and make some progress. Maybe this subject was just too emotional for you to explore like this, understandably.

This place is normally much more easy-going, honestly - I hope you'll stick around. Grounded skeptics are needed to balance out the science-category-recyclers and the philosopher-theorists!

...

AI: You aren't moping you just come across like you reject anything you've "heard" before so you dismiss it entirely

Q: I think most people dismiss things they have investigated before and come up with a dead end from. If you want to color that as moping, that's on you. Not me.

Well, given my first comment was a kinda enthusiastic one (basically I was saying "you too!", check this out) and I basically agreed with you, your response was kinda crap - especially since you obviously don't really get the idea behind it. The fact that you seem to have concluded that something external to yourself causes it is... a sign that you really haven't experimented properly with it and got to grips with the subtleties. It doesn't take much work to prove that's not the case.

...

Prometheus Rising
By: Robert Anton Wilson

Man, I read that so long ago. Is that the one with "reality tunnels"?

Yes, a big part of the book talks about reality-tunnels. Your comment reminded me of an exercise from chapter one where you focus on a quarter until you find one in your environment. It's not every day that I get to link to RAW so I felt compelled to throw it in there.

Right! I remember that now! There's a hundred different ways to say the same thing, I suppose, but each way needs to be said for someone.

I don't think I ever did the exercise. I guess the "owls" are the new "quarters". I think there was another book, Quantum Psychology, which had a language which omitted "I". E-Prime. Quite a thought-provoking read too.

You're right, excellent read! Although I believe E-Prime was meant to omit "is" rather than "I". You mentioned a book called Synchronicity which I keep hearing about randomly but have yet to check out. I suppose now is the time. Thanks!

Right, it was to omit the "is" of identity!

Synchronicity / Kirby Surprise: I initially found the book a bit self-contradictory, but actually it's more that it's intellectually honest and aims to explore possible angles rather than claim a solution. Check out the interview first and you get a pretty thorough idea. Watch out for owls.

...

I just thought of something before going to sleep. Maybe your mom is influencing the other person's thoughts when winning those arm wrestles. I've been looking at some reddit posts recently about energies that we can transmit. I'll link them later. You may have seen some of them because I saw a post about it on this subreddit. This also makes me remember how I finally talked with a friend who also acknowledged the ability to visualize (while concentrating really really hard) what the opponent in a RPS game will do. And then win. Oddly, I have always visualized what hand will be needed to lose, so I have to quickly reverse the idea to make my decision and win. My friend would visualize the winning move. We did not test this on each other because I was too tired during that time period. Jeez, and I might as well share this too. I was playing CS:GO with a friend and some other players I was sort of friends with. I've played Counter Strike for thousands of hours previously, so I had a really good idea of how people move around in the map. So I ended up predicting perfectly where the opposite team would be going every single round, for almost all 15 rounds, until I realized that my microphone was off. I was shouting to my teammates where the enemy team was going, but we always ended up going somewhere else. My friend was impressed lol...but we would have won way more easily if my team had heard my directions. In this particular map, there are at least 10 places the enemy could be heading towards to defend (they were Counter-terrorists), and many other paths they could take to get to these places. A lot of choices. Basically, it wasn't chance. To reiterate, I accurately predicted the enemy's exact movements, which I know because there are points on the map where it becomes obvious where you and the enemy may have intersected or not intersected as the game goes on. So either I predicted accurately due to my extensive skill in understanding the enemy and knowing what choices they make based on previous map gameplay decisions and turnouts, or I used the method of asserting facts, and the enemy team followed my facts. Just as a note, I'm generally really good at identifying human patterns and conditions once I take a long time to learn them, so it's not impossible that I predicted their movements simply based off of our round wins/losses, and the previous choices in movement that the enemy and my team had made in the other rounds, as well as available money and weapons, which affect future game play choices. I've included this story because it combines mental gymnastics with asserting facts. Both are ideas you included in your comments.

Hey, good stuff!

I think it's not about her influencing other thoughts, although that's how someone could imagine that it was happening (and then the limits that implies would apply). It's more straightforward than that: she is simply deciding that something is going to happen and, remaining in a relaxed state, she is then allowing that to unfold (without re-deciding or preventing it happening).

Possible interpretations in general (pushing it out a bit here):

I say: We can't tell the difference between experiencing something we caused, something we influenced and experiencing something we predicted, because it amounts to the same thing:

- Although we encounter time in a "moment by moment" sequence, it is actually laid out like a landscape - always there even though you are only "looking" at a certain part.
- If we predict something, we are "reading" the landscape before getting to a location.
- If we assert something, we are "writing" the landscape before getting to a location.
- When we get to the location, it is whatever it is. We can't then tell whether reading/writing occurred specifically, or whether reading/writing occurred indirectly. For instance, by "asking for information" you might be implicitly "asking for information that corresponds to your desire", which involves making the information correspond to your desire. The background intention or assumption behind the act makes a difference.

Basically, it's like you dream your world. It unfolds spontaneously according to the current "facts"; you have the ability to modify "facts" whether the evidence corresponding to those facts is present within the senses at that moment or not; subsequent experience will be in alignment with those facts. As suggested earlier: once we've made a decision about what's going to happen, though, we have to then not 're-decide' and thereby re-pattern events again, undoing our good work. That's why you need to be non-

attached and allowing.

From elsewhere:

"However you imagine that it works, That's how it works. - TG"

That's one take on it anyway: What you are sensorily experiencing arises as a 'transparent mirage' from the facts-of-the-world in the background. All intention operates indirectly, via adjusting the facts-of-the-world. We never actually interact with our sensory experience. We never actually "do" anything directly, instead we just experience things.

EDIT: Inserted earlier paragraph which I'd omitted.

Ever since I read your post there have been bloody owls everywhere!! I even bought a T-shirt the other day with an owl on it and realised after I left the shop!! You and your bloody owls! I mean, it could be worse I suppose, but it could have been better dammit! I have had to route out your comment again just to tell you about the curse you have bestowed upon me. Its no hoot I'll tell you that much, aw God damn it.

Haha, a hoot indeed! :-) Thanks for sharing.

You've got off fairly lightly: people who've done it more deliberately suddenly find that, apparently, they've been amassing owl-related objects for years without noticing...

Still, if it works for summoning The Owls Of Eternity, perhaps it might work for other, less beaky items eh?

The Owls are a good way for people to explore the idea, I think, because it can't cause any damage. Well, bar a few sleepless nights from nocturnal noise, perhaps. (8>)=

A nice way to think of this is, you are "recalling" an idea or thought-pattern into your experience from the background memory of the world (summary here with deeper links). Objects are like ideas overlaid onto experience - and more interestingly, aren't situations a bit like momentarily-present, environment-sized objects?

Worth experimenting with anyway, I would imagine (excuse pun)...

POST: Serious question, do you believe any of the stories here?

It's helpful to keep in mind that the topic of the subreddit isn't that we are literally living in a computer simulation - the posts aren't meant to be evidence to support that theory in particular (nor any other). Rather, they are reports of experiences which made a person reconsider their idea of how reality is, because it broke their expectations of it, as a starting point for discussion.

From the sidebar:

"A personal, everyday-mode experience for which you have no explanation."

So, in each case, we should be careful to separate out the experience itself from any proposed explanation for the experience. Generally, then, I think I'd tend towards "believing" that the poster had an experienced as described (in terms of sensory unfolding), but its nature is something that is open for debate. The subreddit is not for fictional stories - there are other places for that - so if a post seems suspect, readers should hit that report button to alert the mods.

...

Q1: A lot of people apply Occam's razor to this stuff, and the "normal" explanation makes more sense. But taken as a whole, that starts to fall apart. What's more believable, every person who posts in here is insane, delusional, or making shit up to get imaginary internet points, or that maybe my perception of reality isn't all inclusive?

Q2: Besides, I like the counterquote to the little understood and much overused Occam's Razor. I believe it goes something like "Any model of the universe which isn't strange is likely also not accurate". It's a freaking weird world, whatever's really going on.

Occam's Razor has a specific meaning other than "the simplest explanation is the best", which is loosely:

- "Given two models with the same explanatory power, it is usually better to choose the one which introduces the least number of conceptual entities."

It doesn't say anything about one being inherently "more true", or that the world itself follows some sort of "simplicity rule". In fact, there are many reasons to choose a more complex model: sometimes because it provides an "understandable" model rather than one which simply predicts results but is opaque; sometimes because the more complex model shares a form with other models in other areas, and allows the use of calculation or reasoning approaches which have already been established elsewhere. (Mathematics, for example, is full of areas where something is transformed into a certain format for "no reason" - other than it allows a certain approach to be used.)

We've also got the additional thing where the "explanations" being proposed basically have no explanatory power at all. If there's no way to test a description in terms of predictive power or by applying it to a dataset, then it's not really an explanation at all. It's not that saying something is a "false memory" or "confirmation bias" or "brain seizure" is wrong as such; it's that it is meaningless in the sense that it is non-scientific. It's just a hand-waving "plausible story".

Of course, pretty much all of our ideas for what happened in these reports is hand-waving story-making - but that's actually part of what makes it good: an exercise in flexing our powers of imagination and reasoning, and spotting the assumptions we use in everyday life without perhaps recognising they are assumptions.

POST: My glitch

Coincidences like this are actually the rule; reality is very "clumpy" that way. You are just overthinking them, because you are actually overthinking everything in your current state.

Now, there are "just coincidences" and there are also /r/synchronicities where the coincidence is more deeply personally meaningful, and the universe does seem to 'send us messages' from time to time (or we 'send ourselves messages', depending on your viewpoint). But these are far more significant and present themselves as opportunities rather than just curious details.

Personal example: I was in a bit of a spot a couple of years ago. While in a cafe pondering this, the two guys at the table next to me started talking about a friend who was in my exact situation and the advice the guys came up with was exactly applicable and useful to me. The details of the situation were very specific, and I really was stuck. This was more than just the usual low-level coincidence, which is the norm.

The things you describe in your post, though, seem more like coincidences of the everyday sort but because you are in 'hyper vigilance mode' and are basically scanning the world continuously for meaning, you are over-interpreting them.

Let them go, and let the idea go. Useful things will still happen, but give up looking for them and analysing them. Try and commit to stop thinking so much.

POST: Everytime I hear some word, suddenly everyone uses this word

Welcome to the wonderful world of the Baader Meinhof phenomenon. <https://www.damninteresting.com/the-baader-meinhof-phenomenon/>

Although, the "Baader-Meinhoff phenomenon" isn't really an explanation of anything - more a naming or categorisation of an experience, accompanied by some vague "the brain did it" handwaving. We're essentially just saying this is the "Having A Recurring Experience phenomenon - because that's how experiences work". As with some uses of "Confirmation Bias" as a diagnosis, it can often be essentially a contentless general statement that feels conclusive, but doesn't really say anything.

For example, calling "Confirmation Bias" really requires that there be a fixed pre-existing reference dataset that is known and being surveyed, and then being selectively perceived. However, in daily life it is not clear that there is such a dataset, or at least we must recognise that this is an assumption. If we are to take "glitch" type experiences seriously - seriously as experiences, anyway - we can't necessarily take such things at face value. To assume that the world is a "stable, simply-shared, spatially-extended 'place' unfolding in 'time'" in our responses to experiences whose content is as if that is not so, is circular or redundant; it doesn't truly respond to the report on its own terms, unless we at least make explicit that assumption and any others.

POST: Meta-switching realities

To bring this into a coherent worldview, you really need to examine your underlying assumptions about what it is to be having an experience, what you actually are, what is the nature of time, and so on. Or we can jump straight to an alternative model.

Let me try:

- Imagine a vast grid extending in all directions.
- Imagine that each square in the grid is a particular experience, a particular static moment, as seen through the eyes of a particular person.
- Imagine that the grid isn't just 2-dimensional, or 3-dimensional; imagine that it contains all possible moments, all possible experiences.
- Imagine that your life is experienced as a traversal across this grid, moment by moment.
- Imagine that remembering the past is also a moment, a moment with a thought overlaid upon the experience.
- Imagine that generally the sequence of moments a person encounters do not differ substantially between each step, and that the trajectory is in line with your expectations and intentions.
- However, there is nothing preventing there being a discontinuity, a jump from one moment to another one that isn't consistent with the facts of the previous moment. That would be a 'glitch'. Doing this deliberately would be 'magick'.

In this model:

- From a 1st person perspective 'what you are' is a consciousness that is looking through the "viewport" of a certain square on the grid. There is no solidity to the experience, it is a dream-like experience. Everyone is having the experience of looking through a certain "viewport" at a certain time.
- From a 3rd person perspective, everyone is essentially an "extended person", since they appear as characters the experiences of many moments.

In other words, when you make a 'jump' what you are doing is subjectively 'tuning into' a new grid position. There is no physical jump involved. You do not so much change solid reality as have a discontinuity in your experience. It is possible that only you will remember how things were previously, although at other times you may elect to bring another character through the change with you.

(An alternative take is to get rid of the grid metaphor, and just see all possibilities as being "enfolded" into the space you are experiencing right now, as if it were a dream emerging from your consciousness. Each moment "unfolds" into experience, then "folds" back into the space around you. The grid of all possible moments is embedded internally into your experience, rather than external and you select it.)

...

I'm not being argumentative or anything like [that](#).It's just.....I can't seem to believe in it.

I'm not necessarily saying it's true, I'm saying it's a fun way to look at it. :-) Actually, it's quite a good way to look at the world without believing in glitches, because it also allows for moving into a moment where your memory has changed to be inconsistent.

I still don't really believe in reality [jumping](#).It seems mythical, [somehow](#).It almost seems like the person changed their own perspective in their own mind,but stayed in the same reality.

Some of them it's hard to tell the difference - see reality shifters too, here. But you are right, even if jumps are 'real' then what they are is a person chaining their own perspective - but the meaning of reality has to become more extended than just 'this shared world'. Even if you assume a shared world with defined people, we are all having our own mini-dream experiences of that world; we assume an 'external' world but never experience it.

Classic thought experiment: Hold up your hand in front of your face. Now, point to your real hand. Where is it? It can't be that vision in front of you. If your answer is "in my head", then point to your real head. Where is that? You are "living the dream", one way or another. :-)

Extra bit:

Do look at how many of the comments these days say "absence seizure!"; a lot of the major shifts do seem to have that trait. However, if someone did jump and report a change, then a corresponding explanation would be provided once sought out.

For instance, this post has the comment:

If you tell your friends, the world will change to make the event mundane. It will turn out that someone left the pad in some sort of diagnostics mode or there will be a software bug that allows 10% of random codes to work or something like that.

So there's no getting around it; your world will strive to remain 'self consistent'! ;-))

Q: That is a fun way to look at it,yes. :)
Actually,people who immediately post medical explanations(like absence seizure) is a pet peeve of mine.Not that it isn't possible,I just don't think it should be assumed right away.
I do prefer it when people look into the more mundane explanation,and consider it,instead of instantly thinking they jumped realities.But I always accept the mundane explanation. i.e.Did I a.I misplaced a hammer.Or b.I misplaced a hammer,I've jumped to an alternate reality. I misplaced a hammer.This is reality.
If the hammer comes back wearing a ballerina skirt,then I'll consider glitchiness,not before.
There's an example of people keeping it together and not immediately stating they shifted here:
[https://old.reddit.com/r/Glitch_in_the_Matrix/comments/26fdyv/chartreuse_its_not_red/]

Yes, that's a good example of a proper discussion. It does sound red. It's when we get to the idea that every decision involves a splitting of reality and a new universe, it gets a bit tiring. Thing is, most of the most "Matrixy" stories are probably seizure-like: favourites here
[https://old.reddit.com/r/Glitch_in_the_Matrix/comments/1qu3b6/the_day_the_worldshifted/] - here
[https://old.reddit.com/r/Glitch_in_the_Matrix/comments/1zq56z/but_i_did_own_the_car/] - here
[https://old.reddit.com/r/AskReddit/comments/1xyn79/what_is_the_creepiest_glitch_in_the_matrix_youve/cffvytf/]. However, how would you tell the difference? Are seizures just what glitches look like from an external point of view? :-)

But there are enough quirky stories here of a smaller scale that do indicate that things aren't as "solid and reliable" as we might normally assume.

Q: I sometimes find when people post that it is probably an absence seizure,or other medical explanations,some of them have a tendency to ignore other things the poster is saying,and jump right to the medical explanation,not considering anything else the poster is saying.For instance,somebody comes on and says they have a green car and it suddenly turned red yesterday.They have a friend,and the friend remembers it being green,too.Somebody then replies it was some kind of seizure of some sort,go to the doctor,get checked out,etc,etc,while completely ignoring the part of the post that a friend remembers it as [green](#).It just isn't logical to ignore parts of what the OP posted so it fits into something the commenter is comfortable with.
Funnily enough,when I see the quirky stories that don't mention reality jumps,I don't question them nearly as [much](#).So that's my own prejudice,I guess. :D

Yes, quite a lot of them have some implicit corroboration. In some sorts of stories it's as if people have "fallen in to a dream" together (more reality shifters site than here). But then, perhaps everyone has "fallen into a dream". Thing is, even the ones we dismiss easily seem to have an ongoing life. The Berenstain/stain Bears debate is still raging even right now this month, over on this site.

There is something going on, and the chief barrier to sussing it out is that it questions what it means to be a person having a shared experience with another person. If you and a friend both remember a car as being green, but now it's red and your family remembers it as always having been red - are those still your original family members??

Q:I actually remembered it as Berenstain.But I accept this explanation as very plausible and likely:

AnonymousAugust 23, 2012 at 3:44 PM

I normally don't comment on blogs about our family name but yours was so unusual and imaginative that I thought it only appropriate to add my thoughts. "Berenstain" according to our family lore was an attempt by an unknown imigration officer sometime in the late 1800s to reproduce phonetically a highly accented version of the tradtional Jewish name "Bernstein" as pronounced by my Father's grandparents when they came to America from the Ukraine. In that linguistic region, the name tended to come out sounding something like, "Ber'nsheytn". Since that's how the name was originally documented, it has always been spelled that way by our family and it has always been misread and mispronounced by nearly everyone. It has always been "The BerenstAin Bears". Your parallel reality theory is very resourceful but, unfortunately, by applying Occam's razor, we arrive at the explanation that most people have just misread the name. Mike Berenstain (Son of Stan and Jan) Reply
If you and a friend both remember a car as being green, but now it's red and your family remembers it as always having been red - are those still your original family members??
Yeah,that would be disconcerting.

I saw that too. If you read further down, there is some doubt (in the minds of other posters) about its authenticity, because people are so convinced, but I'm inclined to go with that as the best 'everyday world' explanation.

However, if there was a 'jump' then of course the son of the authors would have the -stain spelling and would have an explanation. Part of the jump is that the resulting universe is self-consistent! :-)

Q: Yes,that's true. It's tough,with berenstain bears there aren't really any downsides,other than a bunch of people are annoyed with you because you don't believe they're from a berenstain bears reality,and then the people who don't believe it are annoyed with them for not realizing they probably just remembered it wrong. It's a bit more serious in a case like this,though: [<http://beforeitsnews.com/beyond-science/2012/01/redux-terrified-woman-from-another-universe-wakes-up-here-1575265.html>] If she actually did jump,they she might be treated for a medical illness or mental condition she doesn't have.If she didn't jump,well then if the jump is accepted by herself and others,she might not go get treatment for an illness(mental or medical) that likely might be kind of serious.

I think that one is probably just a story, but it's actually not too dissimilar to the ones I referenced in an earlier comment. Someone replies into a post of that story, though:

I went to sleep one night and a similar thing happened to me. I was a totally different person(body) when I woke, living in a different part of the country with a completely different family, friends, job, and home. I was still "me" on the inside. it was very difficult at first, taking me a long time to adjust to my "new reality". I stayed to myself about the "shift", in fear if being locked up for insanity. I was able to fool those around me. the years past and I grew happy, forgetting my original life, deciding it was just a dream, rationalizing. I worked, loved, played, slept and dreamed as this "other" person. I was this "other" person. then four years later I woke up again in my "original life" without any missing time. it was the next morning that should have been on that fateful night four years before. I was very confused. I kept thinking I would wake up in the "other life" again. it took a while to get back into my "original(?) life". I had to remember who I was. its been decades now and the memory of the "other years" are faded from my mind. I wrote them down years ago, so I could not forget. I found the "other", he still lives where I had lived as him. I will never make contact. who are we really? there is far more to reality than we know. why was I used for this mission? where was this "other" person while I was in their body? how could I have no missing time in "this" life? talk about a mind f--k. I must conclude we live in a vast multiverse that can somehow become entangled on a quantum level.

Someone else says:

I don't believe her, she has no proof but her words.

Which, well, is always going to be true for this sort of thing. Meanwhile, another explanation here (also offered on these forums for other victims):

What I think is most likely here is that Ms. Garcia is a victim of something akin to the Capgras delusion, about which I have written before (read my original post here [[dead link](#)]). While this isn't classic Capgras -- the most common manifestation of which is a sudden conviction that everyone has been replaced by perfect duplicates -- the similarities are apparent. And she certainly has what is the most striking thing about Capgras and other delusional disorders, which is that while the sufferer is exhibiting symptoms of serious impairment, at the same time (s)he is absolutely convinced that (s)he is entirely sane.

I think this is stretching the Capgras definition too much though; it's about non-recognition rather than things changing. Also, there's no reason it's not real of course, in the sense that things might look the same and yet you 'know' something isn't quite right...

Cheesy list of stories here [[dead link](#)] includes that main one.

Q:Yes,I agree.That does seem to stretch the Capgras definition too much.Confabulation does seem like it could possibly fit some(not all,but some) of the posts on here that involve reality shifting.A lot of times,the poster presents remembering things differently,and then the reality jumping is presented to them,or they seem to accept it,because it's the thing that makes sense to them: [<http://en.wikipedia.org/wiki/Confabulation>] It says it's rare,but can sometimes occur in normal individuals: [http://en.wikipedia.org/wiki/Confabulation#Among_normal_subjects] Not suggesting all or any of them are due to exactly that,I think people should be diagnosed by professionals,and most definitely not be diagnosed by me,I'm not qualified to. This one would fit that,except it's hard to explain how they knew how to ride the bike(not picking on them,it's just one of the most recent I recall reading): [http://www.reddit.com/r/Glitch_in_the_Matrix/comments/2gis9e/a_illusory_road_trip/] Though again,with the non-proof of jumping realities,then somebody who feels they jumped realities could disregard that. It's quite interesting.

I read that too. 'Confabulation' is a pretty interesting idea. Again, though, the evidence would be identical either way. But for individual's stories, it works; for shared memories or when there is a 'skill' in evidence, perhaps not.

However, there are cases of people suddenly becoming great guitar plays or being able to speak foreign languages fluently after head injuries. Example here [[dead link](#)], but there are better ones. Good musical one here. Meanwhile, there's cases of people with higher-then-normal IQ who have almost no brain tissue. In other words, things are generally stranger than we might imagine anyway. Is it possible to "access" bike riding skills without having actually learned them?

A further thought is: To what extent are our memories actual our lived history? If I were to 'snap awake' right now, it's hard to tell if my remembered past occurred or not. Mostly, I am unlikely to examine it for discrepancies - discrepancies might be arising all the time, but people are oblivious because it's rare they notice a 'clash'.

Q: Oh,I read a couple similar stories quite a while back.There's another story about a guy that started hearing music in his head and started playing the piano after he was struck by lightning: [<http://www.newyorker.com/magazine/2007/07/23/a-bolt-from-the-blue>] The girl who speaks german after her head injury is really freaky,I wonder what caused that? Sure.I might remember having a grey mug a few years ago,and then it got broken.What are the chances that somebody will mention the mug,and inform me it was really green?And if nobody brings it up,I'd never realize I remembered it [wrong.It](#) probably happens a lot more than we realize. :)

Amazing stuff.

I guess one point is: We create our memories - or at least we 'assemble' them from something - we do not recall them. Where we create/assemble them from is debatable.

Of course, people do try to make these things happen intentionally. Randomly here:

...the persons present shift their point of view from the Universe that they were in, to another parallel universe that they have now arrived in. This 'jump' is spoken of repeatedly in the Dialogs."

Ebony liked to describe the phenomenon of the 'jump' as a movement into a parallel timestream, but it can also be seen as a re-alignment of the same universe, with all the paradoxes that either description entails. The experience is the same in either case. The limits of the universe seem to collapse into the space of the working. Over several minutes or hours, depending on the strength of the working, one's sense of outside reality begins to re-solidify. Often details of the new universe are discovered to be different from that of the old.

POST: [THEORY] Scientists able to make the present determine the past.

Yes, it's a nice experiment, thanks for posting! Some thoughts:

I'd suggest the particle-or-wave isn't a wave or a particle prior to conducting an observation - rather, "particles" and "waves" are observations. Here's a nice snappy article from Nature magazine which offers a nice view on this:

The only reality is mind and observations, but observations are not of things. To see the Universe as it really is, we must abandon our tendency to conceptualize observations as things.

-- The Mental Universe, Richard Conn Henry, Nature, 7th July 2005

To continue:

Talking about things "being this" and "being that" independent of them being observed is an error. Extending this, it does not make sense to talk about "something happening" when it is not being observed. This is because the facts-of-the-world do not exist in the same form as we experience them within the senses. Our habit of using our minds to "imagine how things are" and "imagine what happened" is just that - imagination. It amounts to making up little "sensory stories" about the world as if they were playing out.

Philosophers like Immanuel Kant had the notion that time and space were, effectively, "basic sensory formatting" of the mind just like shapes, tones, and so on. The world itself, world-as-it-is, is not spatially or temporally organised. It is an "infinite gloop" of dimensionless facts - not even! - which doesn't correspond to our conceptualisation, because conceptualisation itself is formatting.[1]

This means that you live in a mode of constant experiencing which is only organised "as if" there is time and space. Cause and effect don't mean anything:

- The only rule is that the apparent world remains self-consistent as an entire pattern.
- This means that all observations will be coherent, without regard to apparent distances in time and space.
- Time and space are part of observing, not inherent divisions of the world.

More broadly:

- Things that you aren't observing don't "happen" in a way that corresponds to sensory experiencing.
- Observations are the only things that "happen".

Potential relevance to glitches:

- If a change is made to the (implied) world-pattern, the whole pattern will shift to ensure self-consistency.
- There will be no trace of the previous state of the world-pattern after the shift.
- This may not include the observer's memory, which will contain memories of experiences of the former state.
- The observer's memory may therefore fall out of step with the world-pattern.
- Glitches involving a world-pattern shift will leave no physical evidence other than the memory of it.

Final thoughts:

- Therefore in a way what we are truly experiencing is the "formatting" of our own minds.
- We might view this "formatting" as the memories of previous observations + their implications.
- Experiences leave traces which in-form subsequent experiences...

[1] There's an easy-reading article on Kant here
[https://web.archive.org/web/20130516095302/http://philosophynow.org/issues/95/Kant_at_the_Bar_Transcendental_Idealism_in_Daily_Life], although it gets it slightly wrong in later parts in my opinion.

EDIT1: Made some changes for increased... coherence and self-consistency. Added some glitch-based musings.
EDIT2: Added some concluding remarks which, interestingly, connect to a previous comment about synchronicity.

...

Thanks, U-Chairs, nice post.

You might also look at it from a simulation standpoint where rules dictate the outcome of a given physical setup, and these rules are running in "realtime". So while the helium atom is not being scattered, the particle rules are employed. But as soon as that second "grating" is added, wave rules are now used. Thus when the atom hits the detector, the pattern is calculated as wave interference. Hmm, I wonder if they could turn off the second laser grating right before it hits the detector (but after the atom supposedly went through it). This would be a delayed-choice-oops-I-changed-my-mind-again experiment. [Modeled after some dates I have been on.]

Has anyone done this?

You can't fool it. No matter what you do, the result remains self-consistent. Lots of variations have been tried.

It's as if once an observation is made, the larger "implied pattern" of which that observation is a part, becomes fact. It doesn't matter which part of that pattern you trigger or when - once you've done so, the larger "fact" becomes the situation.

So by making part of the pattern "concrete" or realizing it, all the other parts of the pattern must necessarily come into reality, in order for reality to remain consistent. I was thinking of the uncertainty principle the other day and how interesting it is that reality doesn't seem to want to be pinned down to a single set of physical parameters. It's as if there always needs to be a bit of wiggle room. I wonder if these phenomena are related to this apparent spontaneous creation of "reality". There's always a little room to fudge the data, so that stuff agrees with what we see.

Extra bit:

One might wonder - are there methods to artificially give ourselves the experience of "something being true", such that subsequent observations are consistent with that experience...?

Perhaps placebos are more than mind over matter. Maybe they are mind over reality?

Nice idea! There have been experiments like that before. In fact, there have been lots of pretty thorough "psi" type studies but they don't get any traction. Interestingly, enthusiasm seems to play a large role - beating the statistics towards the beginning and end of sessions (getting bored in the middle). Random list.

I would take this a step further though. "Fooling ourself" seems like a weak version of such an effect - especially belief isn't causal, but rather a filtering of what you might attempt to do. (i.e. It's intention which brings about change, and believing something simply means you are more likely to go all-out with intending it.)

Instead, it would be more interesting to see if we could "assert new facts" deliberately. Perhaps mind = reality, and so all cases of cause and effect are, in effect, expectation or habit (i.e. residual intention) by someone, singly or collectively...?

(Aside: And we might ponder what "collectively" would actually mean. If there were contrasting intentions, would we be competing or would we simply have divergent experiences.)

[EDIT: Added headings to avoid wall-of-textness!]

Consistent Patterned Reality

So by making part of the pattern "concrete" or realizing it, all the other parts of the pattern must necessarily come into reality, in order for reality to remain consistent.

Right, but it's completely automatic, like autocomplete.

It's like we accumulate facts and those facts act as a filter or formatting for what can be experience subsequently. A new fact narrows the possible future facts. It's a bit like exploring memories by association (as we've said before). You recall a memory pattern and then you are restricted as to what you can remember from there. The rule is that the next pattern must always "make sense". It must always be thinkable from where you have got to so far.

If you are in a "moment" where observe that a particle is in a certain state, then you can only move to "next-moments" which make sense, which correspond to a coherent world. For as long as there is ambiguity, though, your "next-moments" are less restricted. So long as you don't know, you have more flexibility.

- **The facts-of-the-world are being fixed in real time.**

That's why it's good to focus on actual experience. What you imagine about something just doesn't count. (Unless perhaps you imagine it really, really intensely...)

Uncertainty and Unpindownability

I was thinking of the uncertainty principle the other day and how interesting it is that reality doesn't seem to want to be pinned down to a single set of physical parameters.

When two things are the same thing but divided across formatting structures - e.g. it has aspects in time and aspects in space, like position and momentum - then we have a problem.

It's like trying to see both sides of a coin at the same time. The coin is a single pattern, but because our experiencing is formatted "spatially" then we can't experience both sides at once. If our experiencing had been formatted "spectrally" then perhaps we would be unable to see different colours at once.

We make this mistake again and again: seeing "two things" when it is just aspects of "one thing". In the limit, of course, we realise that the universe itself is just "one thing" and the only divisions which exist are the formatting of our minds.

Those psi experiments are cool, but to me they always seemed too experimentally "soft" for the mainstream to take them seriously.

Yeah. Actually, it works the other way than you might think: anything that isn't "soft" is very hard to get a mainstream study going in. You're right: the telepathic vs reality effect is difficult, as is the causing vs predicting thing in general.

I'm not very interested in psi research work actually, of this type. Just experimenting with generating synchronicity and so on, it is easy enough to prove to yourself that there is a flexible aspect. The official recognition that "stuff goes on" is nice. But there are also inherent limits maybe, due to the way experiences are formed.

If we want to assert new facts, it seems like these are the two inhibitors that need to be overcome.

I think those two things are very present. Children often are intention machines actually - environment responds to their moods; strange experiences. Some stories also indicate a problem...

And that problem is that the "world-sharing" model doesn't appear to be a simple one. If you have an "extreme intention" it may just be that you stop sharing your environment with those who would not want to experience the results. I don't mean by that that people disappear, more that you are sharing your reality experience with the versions of "extended people" that overlap with your own formatting.

Make a dramatic change, and you've shifted the "world-pattern" to what you want, but only you have a memory of the previous state.

Btw, I was thinking that maybe that's how "magick" works.

Yes, I think it exactly works via plausible mechanism. There is no actual mechanism, but adopting a "second cause" (an apparent technique or method, combined with a shared worldview for confidence) allows an "as if" mechanism. More precisely, I think that magick and indeed the everyday world works by what we might call "Active Metaphors". That the conceptual model you have adopted = the formatting of your mind = the formatting of your experience. Change your formatting, change your experience.

Common metaphors = common, shared, everyday experience. Unusual metaphors = unusual experience. Deliberately utilising this would be the deliberate practice of magick. I've actually played with this quite a lot. It comes as a direct offshoot of contemplating the structuring of the mind really. Synchronicity, imagination, direct intention, willing. Variations on the theme of perception.

Want to try it?

What do you have "in mind"? :-)

Just this Saturday, I tried to "intentionally" find a frisbee to play frisbee golf at the park.

Yeah, that's how it kind of works mostly. I don't think it's restricted to that though. The takeaway from the OP experiment is: "The only rule is that the world-pattern must remain consistent overall".

However in this area we push into new territory: About how observations may arise, and if observations have to be permanently "true", and what keeps prior observations being apparently "true". If all that's required is that the world-pattern remains consistent, we can make potentially make any changes we like so long as the world continues to "make sense".

And surely "making sense" is a property of the mind, not of an external universe. In other words, if an observation is a sensory experience and there is no "solid world" behind them, perhaps the only making that observation continue to be "true" and have an effect on future observations, is us...

I'm just wondering how far this goes. People often talk of Steve Jobs as having had a "reality distortion field". Maybe he did in fact have one.

Steve Jobs exactly was into this sort of thing. If you read his biography, his history is along those sort of lines. Not "magickal" but more a muddle of Zen and intention. However, I also think he never really understood it, it was based more on a sort of narcissistic arrogance, self-delusion and lack of awareness. He sometimes believed rather than knew. He did after all die of thinking he could cure pancreatic cancer via a diet (a diet which he'd been on, and is linked with pancreatic troubles). In other words, sometimes he use "force of will", but other times he resorted to "second cause".

Was that history in the Walter Isaacson bio?

Yes. It's surprisingly not very fawning at all, as it goes, considering it's official. To Jobs' credit, he encouraged him to write what he thought, to be accurate.

(I mean, Jobs had all sorts of issues, denying his own daughter for 20 years, weird emotional things with people and not understanding them as people, having family meetings about choosing a washing machine. I think he was pretty 'internal', probably mildly autistic or aspergers or whatever. He definitely had problems with feeling-out, both in the 'empathy' and in the 'deciding' sense. This classic picture said it all.)

Do you know about the 5-Hour Energy founder, Manoj Bhargava?

No, that's interesting. He probably found that the mystics had been buzzing on a local lucozade for years.

Actually, now that I think about it, the possibility of this stuff does scare me somewhat. I'm not really sure why...

Perhaps it's because, if you can change anything, and anything includes your experience of being-a-person, then you realise there is nowhere to stand that is stable (it seems) - and you can only be the background context in which experiences arise.

If it's true that the only rule is "the world-pattern must remain coherent overall", then you can completely remake the world right now. Just declare prior observations arbitrary, and being again with a fresh observation this moment. But what does that mean for all that you have (apparently) been and experienced thus far?

Perhaps the experience of Narada can cast some light upon the matter:

Narada, Vishnu and Maya

In Devi Bhagwata Purana, it is mentioned that once Narada asked Vishnu about the secret nature of Maya (Illusion).

“What is Maya?” asked Narada.

“The world is my Maya. He who accepts this, realizes me,” said Vishnu.

“Before I explain, will you fetch me some water?” requested the Lord pointing to a river.

Narada did as he was told. But on his way back, he saw a beautiful woman. Smitten by her beauty, he begged the woman to marry him. She agreed.

Narada built a house for his wife on the banks of the river. She bore him many children. Loved by his wife, adored by his sons and daughters, Narada forgot all about his mission to fetch water for Vishnu.

In time, Narada’s children had children of their own. Surrounded by his grandchildren, Narada felt happy and secure. Nothing could go wrong.

Suddenly, dark clouds enveloped the sky. There was thunder, lightning, and rain. The river overflowed, broke its banks and washed away Narada’s house, drowning everyone he loved, everything he possessed. Narada himself was swept away by the river.

“Help, help. Somebody please help me,” he cried. Vishnu immediately stretched out his hand and pulled Narada out of the water.

Back in Vaikuntha, Vishnu asked, “Where is my water?”

“How can you be so remorseless? How can you ask me for water when I have lost my entire family?”

Vishnu smiled. “Calm down, Narada. Tell me, where did your family come from? From Me. I am the only reality, the only entity in the cosmos that is eternal and unchanging.

Everything else is an illusion – a mirage, constantly slipping out of one’s grasp.”

“You, my greatest devotee, knew that. Yet, enchanted by the pleasures of worldly life, you forgot all about me. You deluded yourself into believing that your world and your life were all that mattered and nothing else was of any consequence. As per your perspective, the material world was infallible, invulnerable, perfect. That is Maya.”

Thus Vishnu dispelled Narada’s illusion, bringing him back to the realm of reality and making him comprehend the power of Maya over man.

Thought experiment: What if your girlfriend (or whatever) had blonde hair and you'd prefer brunette. What if you could just intend and change that "fact" now. Would you? If not why not?

Okay, what if instead you could intend and then events would unfold such that she changed her hair colour (spontaneously deciding to dye it). Would you? If so, why would that be better? Just because there's a little "story" between what you did and how the result seemed to happen?

Interesting things to ponder, and examine your actual response.

EDIT: Extra sentences about Steve Jobs, added a thought experiment.

When a death event occurs, if our awareness is so opposed to death at that moment...

Yes. I think there is always a next-moment. That next-moment might be that the crash didn't happen, or that you survived miraculously, or maybe you experience "dying and leaving your body and going somewhere else", or even just losing all memory and being reborn. But... there's always more dream no matter what.

So, the next-moment as defined by a mix of plausibility and pattern momentum, perhaps?

Talking about altering facts, it could be possible that some larger scale fact-altering experiment has already been conducted...

Could be. There does seem to be a lot of fluctuating. I think it's a mix of there being shared updates, and there not being a single shared world really. Something more like multiple personal dreams with overlaps which come and go.

In other words, the "consciousness" that is experiencing being-Scroon and the "consciousness" that is experiencing being-George overlap (are both looking out into the same space) so long as we are aligned. We share some "trajectory" together. Our dream-space becomes common and entangled for a while.

However, if I intend something that is completely contrary to your intentions, our worlds may disentangle, and the "Scroon" in my experience won't have "you" looking through it anymore.

If we really go crazy with reality manipulation, perhaps we end up completely alone in our world - with nobody else sharing the experiencing, nobody else looking through the perspective of the other people. The more "God-like" I try to become, the more that might be the case, since nobody else would want to have the experience of being the other people in my life...

Deity is a dirty, lonely business!

EDIT: Bad internet made the posts multiply per revision, so deleted 'em except this one.

Hey, perhaps that's part of the fear of taking over the world through intention. It's a subconscious knowledge that you can manipulate other people, but then they cease to be awarenesses and function simply as behavioral automatons.

It is part of it - but remember that unless (and even if) you directly manipulate them, they are not automatons, they are completely human and going along their own trajectory as characters in your dream. And even then...

This is the case anyway. Even if you're not doing it consciously, the aspect of other people you are experiencing corresponds to the state of your mind. In fact, are the state of your mind - since the content of your mind is your experiences, and that takes in perceptions, sensations, thoughts: all experiential objects and events.

You are exploring the state of your own mind whether you like it or not. Deliberately changing the state of your mind is just you unfolding consciously rather than accidentally. Until now, you just didn't know what you were doing anyway...

Changing this "external" stuff by willing is no different to moving your arms and legs. It's all you. And as you wouldn't bend your arms the wrong way (them being "you"), you wouldn't bend the people you encounter inappropriately (they are "you" too). So ironically, the potential for "powers" comes with it a realisation which means you are more compassionate to others in your world, rather than less. The nature of power has this baked in because of its nature!

I just had a thought that reality could be like Tinder for patterned experiences.

Tinder: Reality Path Selector Upgrade - great! :-)

Q: *means you are more compassionate to others in your world*

Love and compassion keep coming up when exploring these things. Who would have thought?

I guess if you keep in mind that perhaps our awareness is part of the awareness of the totality of existence, then the idea of "me" vs. "others" ceases to have meaning.

Yesterday, I was thinking about the nature of individual cells in the body. One cell can alter its environment by expressing signals, yet you wouldn't say that it's necessarily controlling its neighbors. They are all part of the bodily experience, aspects of the same shared system while also in control locally.

Hmm. If you are your neighbours though? Or if your neighbours are your experiences? Because "you" yourself are an experience?

Oh man, now my head hurts. :)

Don't you mean... your experience of a head? :-)

...

If you approach this from a scientific materialism pov- consciousness is caused by the brain- If the universe keeps branching, creating copies of me, and copies of my brain, then I should be conscious of myself in all those universes that I'm still alive in. But I'm not- for some reason, my consciousness chose one of many paths, why? how? If we take a non-materialistic view and consciousness arises from the soul, not the brain- then the soul chose one of those many paths. So then in the rest of the universes I'm soulless, therefore have no consciousness? If not, then what? A different soul enters my body in those worlds? It doesn't matter if you take a materialist or non-materialist approach, the multiworld theory raises some really difficult and profound questions that don't seem to have answers.

In both cases you are assuming consciousness is somehow "in" the world and that the world is an actually spatially-extended place, independent of our experiencing of it.

If you flip it around, and have sensory experience arise within consciousness - and have time and space as the structuring of mind rather than an external structuring, a la Kant and others - you avoid all this. "Many universes" are just "different conscious experiences" aligned to a different set of facts (none of which takes up any space). There are no bodies to be filled: a "body" is just a set of sensations and thoughts, an experience.

Meanwhile, given that time is not something that "passes" but is instead an aspect of experience, all possible viewpoints and experiences are in effect active simultaneously. One consciousness then takes on all experiences at the same "time" - including being-UniversalChairs and being-BlahBlahBlasphemee.

TL;DR: None of these things is an issue, they come from assuming that time and space are properties of the universe independent of conscious experiencing. Actually, there is just one thing. Can't get more Ockam than that... ;-)

This experiment actually involved either adding or taking away the second grating AFTER the atom hit the detector. In different rounds of the experiment, they tried both ways, adding the grate or taking it away. In every case, changing the experiment after the atom hit the detector changed the behavior that the atom exhibited in the past when it passed the detector. That's what's so remarkable about this. It is a delayed-choice-oops-I-changed-my-mind-again experiment.

But it's important to say that it didn't change the behaviour that the atom exhibited, right? That atom didn't have any behaviour at the grating/non-grating, because we didn't observe it there at the time it passed. It's important here to distinguish between inferred behaviour due to a model or expectation, and observed behaviour. The only behaviour observed was at the detector.

The real takeaway is that our little stories about "particles going on a journey" are just imagination?

Yes, that's a good point. The information gained is necessarily after the fact. So when speaking of behavior, it must be "inferred behavior".

Right. "Behaviour" is a sensory thing, it is the name of an observation. There is no such thing as unobserved behaviour. Imagining something in your mind is not the same as it happening. Imagining that "something happened" but is unknown, is still not the same anything happening. It's not that we don't know what happened. It's that nothing happened. Because "happening" is an experience.

Q: *There is no such thing as unobserved behaviour.*

Yup. That's basically what this experiment proves. Even though we have this perspective of a linear flow of time, and we would expect that the particle hit the detector at a certain moment in time, that's not the case at all. Nothing happened until we observed it happening, in which case what we think of as "the past" seems to have been impossibly been altered by the future. In reality, if such a thing as an atom and a temporal dimension exist in any fundamental way, they're not bound by linear time.

It is a dream-world - one that we are dreaming into being, moment-by-moment!

Really, I suppose all of this is saying what a clear-minded focus would reveal. If you never fantasised (thought-about things) ever again, your experience of the world would be accurate. There is obviously no such thing as a past or future. There is obviously no such thing as an object or event you have not seen. Those are just "sensory shadows", mere imaginings, overlaid on our actual experience...

Of course, if you didn't think, then you wouldn't be able to enjoy that realisation...

The detector did record some state at the moment that the atom passed it.

No, it didn't record anything at the time. The detector wasn't in any state until it was observed. Nothing "happened" at all until an observation was made. There was no fact-of-the-matter until then.

The real takeaway here is that information in the past that is unknown in the present is actually not determined at all until an action in the present decides what happened in the past; at which point the past that we get is one consistent with our present.

The essential is right, but you are still describing an unfolding of unobserved events in time surely? The past in this account only exists in the imagination, remember. The connective story is about the past, but nothing happened in the past. If you imagine being the scientist, looking through his eyes, moment by moment - while avoiding imagining anything else going on from a "god's eye" perspective - then those are the only facts-of-the-matter.

Q: *No, it didn't record anything at the time.*

Well, yeah, you're right. It's more accurate to say that if our expectations of linear time held true, then the detector would have recorded some state at this moment. But because the state is able to be determined at a point in time after the point that the atom should have been at the detector, this seems to show that indeed nothing happened until the outcome was determined and the observation was made.

Right! It's our story-making that is in error, with our assumption that the world is inherently spatially-extended and temporally-sequenced, rather than just our experience.

I'm really pleased this experiment has been revisited. The original versions lead to the same conclusions, but they have become lost in time (excuse!) such that discussing them seems like 1950's philosophical curios rather than genuinely serious.

I've always been drawn to that idea for as long as I've known about the 2 gate test.

Quite! That and David Bohm's approach - the implicate order and so on - pretty much got me on this. In effect, we are dealing with a situation where - although only a small part of it is unfolded into the senses - the entire timeline of world is always present and available for revision, limited only by the restriction that it must "make sense" as a whole.

Which leads us to ask: isn't that restriction just something that we impose?

Literally I've been building a very stable theory on how everything is governed and this just confirmed a big part of my theory.
A simple, but extremely plausible example I'll put out is let's say everyone on June 1st had a great day, or close to everyone. There's a chance that a related event (spawned from a simple thought that "snowballed" into existent) can be created that took place 1 year ago to 50 years ago. I definitely have started discovering my profound fascination in our life right now

Because... there is no "50 years ago"? There is just a self-consistent present experience?

If a new "fact" was somehow created now that implied an event had occurred 50 years ago, then subsequently all observations would be consistent with that event having occurred 50 years ago. There is no actual history, there is just observation, observation, observation... sometimes an observation is "about" a past event, but there is no actual persistent past event. Only a coherent experience now.

We don't know what time is, or isn't.

Perhaps the answer is: there isn't.

Actually that comment should have had some "consider this" type question marks, since it was indeed written as speculation rather than declaration - duly added! However, I'll stand by the idea that "all time is now", that the "past" is embedded into "now", which in effect means time is an aspect of the observation, not of the universe. (Following on from OP.)

Maybe. But, at this point, it's purely personal guesswork... Theres very little conclusive evidence, either way.

I think in matters of time and space, it comes down to personal experimentation. Time and space are the "fundamental formatting" of perception. This is different to the representation of time and space in descriptive schemes.

Which gives us a problem in terms of studying it "objectively": you can't. Observation and modelling rely on reality being "made of parts" before you can begin, and time and space is what lets experience be made of parts (spatial partitioning: objects, temporal partitioning: events).

It's basically the same thing as trying to study consciousness.

Time and space necessarily existed long before consciousness came on the scene...

I disagree. I definitely don't see how they existed "before consciousness". Particularly since they are concepts derived from subjective experience.

...experience exists within an objective framework that is space and time

I'd say that experience might be "formatted" in terms of space and time, but I don't see how experience exists within an "objective" anything. It's important to distinguish between our stories about our experience - stories which of course exist only within conscious experience - and the actual nature of experience itself. We can only ever really examine the formatting of our own minds: Our thoughts about our minds, are of course within our minds and therefore subject to its formatting.

We imagine space and time to be pre-existing only because our thoughts are inherently structured as "shadow sensory experiences", and so pre-formatted by space and time. We cannot perceive or think our way beyond that formatting, so we incorrectly assume it is inherent to the universe. (Except for the occasional mystical experience, of course.)

The experiment described in OP point exactly in this direction (and it's an old idea in philosophy too: Berkeley, Kant, etc).

Okay, I'll accept the only thing we can ever know is our own perception, and we cannot know to what extent that is wrong.

And even: wrong compared to what, exactly? We can only compare one experience with another.

So, when I refer to the universe, I'm simply talking about the apparent one.

Me too. The universe of human experiences.

That apparent universe is composed of quarks, which themselves may be composed of something else.

Well, strictly speaking - and what is at the core of the experiment described in OP - is that the universe isn't composed of quarks as such. Quarks are ideas in effect, just like atoms. They are connective concepts between observations. What you have described - quarks, particles, and so on - is a connective story, a fictional framework. One that operates very nicely in terms of linking particular observations together. It's not "how it really is" though. As any good physicist would tell you: physics is about models which predict observations within their remit, not about truth.

[the story...] if indeed, anything can be said to that affect at all.

That's probably about right. Nothing much can be said about that. All we can do is come up with a conceptual framework which matches present observations.

it follows consciousness is an emergent property of space and time, and not the other way around.

Well, it doesn't follow at all. Our scientific work starts from observations as a conscious being. That is the primary fact. The whole idea of emergence of consciousness from matter is extremely problematic, and not supported by evidence.

Which is why even neuroscientists such as Christof Koch are referring philosophical ideas like panpsychism, and cognitive scientists such as Donald Hoffman theorising about interface theories and conscious realism. Both take consciousness to be a fundamental property of "whatever it is that the universe is made from".

In fact, the work of Wheeler (the designer of the OP experiment) leads very much to conclusions of this sort as a solution to the "hard problem of consciousness", as described by David Chalmers:

Wheeler (1990) has suggested that information is fundamental to the physics of the universe. According to this "it from bit" doctrine, the laws of physics can be cast in terms of information, postulating different states that give rise to different effects without actually saying what those states are. It is only their position in an information space that counts. If so, then information is a natural candidate to also play a role in a fundamental theory of consciousness. We are led to a conception of the world on which information is truly fundamental, and on which it has two basic aspects, corresponding to the physical and the phenomenal features of the world.
--Facing Up to the Problem of Consciousness, David Chalmers

To continue...

However, that isn't apparent from observation, so we must proceed, especially when dealing with each other, with what is apparent.

We must proceed from what is apparent, but we must bear in mind that what we mean is: "what is apparent to us". Without this, results such as the OP experiment become intractable.

It is apparent space and time are not only prerequisites for conscious perception, but that they don't require it and certainly existed long before it.

It is more accurate to say that "nothing can be said" about this. I don't think we can say that time and space are prerequisites for experience. All we can say is that they are aspects of experience. Of our experience.

When a physics experiment (as above) is obviously operating outwith that formatting, we can say with certainty that it is not a fundamental division in the world-as-it-is, it is only a division in the-world-as-experienced.

If we don't make the distinction, we cannot model these observations.

Maybe that isn't true, but maybe the universe is an aliens pre-school project... It doesn't matter, since both are equally likely to be the case, along with an infinite number of other arbitrary assertions.

Hmm. It's only you that is making arbitrary assertions beyond what can be observed. I am strictly within what is observable and making no assertions that go beyond sensory experience and thought - to the extent that I am not willing to confuse the structure of experience with the structure of the universe. Which is just as well - because if I had done so, the Wheeler Delayed Choice experiment would be not a fascinating reveal of our assumptions, but the breakdown of the universe itself.

EDIT: Not exactly sure where you were going with the flying, simulation and aliens stuff? Just because there's no solid world beyond conscious observation (as indicated), doesn't mean there is no structure to experience.

After all, that is what we are truly studying: the regularities of the human experience.

POST: How to produce a glitch in the matrix (part 1)

...another way that I might frustrate it would be by acting without a goal.

That's actually an interesting line of experimentation. There is a difference between performing an action with a purpose in mind, and simply performing an action. A different experience results, even though in a basic sense the behaviour is apparently identical.

A mundane example would be, while sat down: to move your muscles in a way that corresponds to standing up, versus intending to stand up and allowing movement. The former amounts to "intending my muscles to move" whereas the latter is "intending to stand up". You have to actually do the experiment to get the difference. (I think that, in this case, most people typically move using a muddle of the two.) You can then extend this to target outcomes which are not so "local" in terms of timeframe or location.

As for the rest of it - it sounds very much like you were becoming aware of your own patterning, and observing that making changes to this can have quite unexpected side-effects for our perception of more than just ourselves. Although we tend to conceive of ourselves as both perceiving an external world directly, and also making conscious behavioural choices on a moment-by-moment basis, a brief period of observation shows that this isn't the case. In the first case, all sorts of quirks reveal this not to be true, and in the second we discover our ongoing life is more like a "spontaneous multi-sensory happening" that we only occasionally redirect intentionally. Even the feeling of "doing" can turn out to be more like a habitual experience of muscular tension, than actual choice-making and controlling.

I'd suggest not getting overly focused on theories relating to "simulations" and so on - a lot of that stuff is just today's cultural metaphor of the moment; it's best to stay grounded by paying attention to what you actually experience, rather than getting swallowed up by a narrative about what's happening in an imaginary "behind-the-scenes" that you will never observe.

Aside: If you leave a blank line (hit return twice) in your text, that'll create some more paragraphs. It would make reading your post much easier - thanks. Meanwhile, your pattern-breaking counter-action idea reminded me a little of The Dice Man.

POST: Do any of you really believe that life really is a computer program?

It's a fun thing to think about philosophically, but the actual notion of "a computer program" being used ends up being so abstract as to be pretty much meaningless. It ends up being just another version of the older idea that the-world-as-it-is is not of the same format as our sensory experience of it. In other words, that its basic structure is not a "spatially-extended place unfolding in time", and that apparent division, multiplicity and change are aspects of experience rather than inherent properties of the world itself. A related point would be that our descriptions about the world are "parallel constructions in thought" and actually say nothing about the world itself. We never "think the world", we only think our thoughts. Noticing that some of the content of our experience deviates from the usual narrative, and that some aspects of it are of the same structure as the "computer programs" story, doesn't necessarily mean much. Typically we are just comparing one conceptual framework to another. It just highlights that our descriptions are generally very basic, and that we are good at noticing partial pattern matches in two strands of experience (where strand 0 = ongoing sensory experience; strand 1 = our thoughts about sensory experience; strand 2 = our thoughts about computers).

TL;DR: The world is not "a computer program". Also, though, the world is not "a world".

POST: Sudden realization about the universe's nature before falling asleep

[POST]

Well, last 27/march i had this unexpected information "download" right before falling asleep, i had almost forgot that. So i'll register this here because i think it somehow fits this subreddit.

I laid in my bed and i haven't though about anything that dense for the whole day, but suddenly i became this internal monologue that just flood through like i was listening to a podcast, but also was myself. It was like that:

-What is time?

-Every single moment is like a sheet of a book. They are really thin slices, and everything is right here, right now: past, present and future, in the whole universe this is the same.

-So i'm existing at the same time everyone else in the whole history far back and far in the future?

-I am

-But the planet is moving in the space, we won't be even in the same spot

-The planet and everything else is simultaneously all the same places it was and it will ever be, these are just different sheets of the book

-but how does the book move forward?

-the universe is expanding like a wavelength, and the different lengths are the different pages in the book

-So its possible to travel through time

-You just have to syntonize the right wavelengt. you might sintonize to a bad place like the outer space, though, because earth could be somewhere else by that point.

-so better get a space suit to do this, right.

It seems shallow and a little pseudoscientific, but there were some other times i just "had information". When i was younger, like 4 or 5 years old, i had a friend of my age complaining about bug bites. He started kid's shenanigans like making up things. The dialogue was something like this:

-Bugs bite us because bugs are bad!

-They aren't bad, that's just something they have to do.

-No, they're evil! they likes to hurt us.

-They only do this because they have to, it makes no sense they would get so close just to be annoying!

-I heard they poop under our skin and put nasty things in there!

-They could just poop anywhere, they wouldn't risk getting slapped just to poop under our skins

-Why would they do this, then?

-To feed on our blood and put eggs and their little bugs would feed on us until they could get out.

Since when he first said that "bugs were bad" i just knew the whole thing, and at the same time i made these affirmations, inside i was like "how do i know this? why can i be so sure?".

Whatever. Note that all of these was in another language.

Tr;Dr: sleepy me knew shit about time, 5 yo me knew shit about arthropods biology.

[END OF POST]

AI: *I had something somewhat-similar happen in middle school. I was in 8th grade, and for some reason that I still do not understand, I suddenly developed an interest in time travel. I did in-depth research and study for over 3 weeks. Keep in mind, I was only 14 years old and had no understanding of quantum physics. Yet, here I was reading fucking Michio Kaku and soaking it all up like some kind of guru. I spent every hour I could on the internet looking up reports and theories, and the rest of the time I'd be highlighting lines in material I'd printed out, taking notes, and drawing detailed diagrams. I understood it all, and more than that, I expanded on these theories and developed my own. I had done what no scientist had done before - I not only figured out how time travel could be accomplished, I declared reality itself to be another dimension that can actually be traversed, and I also discovered a new law of nature that explains that paradoxes are avoided by the automatic creation of a new universe to counteract it - thus, paradoxes are both unavoidable and impossible at the same time.*

Or, as I wrote in my 8-page report:

"For every paradox, there is another universe created to balance it."

Long story short: What you came up with in your epiphany is absolutely correct. If anyone wants more information, I still have the full text of my report with diagrams and all. I sent it to a former science teacher I knew who used to be a physics professor, and he said it all sounds plausible and does not contradict any known laws or fundamentals that he's aware of - in other words, everything I came up with in this random unexplained period of advanced interest... is scientifically accurate. Since then, the multiverse theory has gained more widespread acceptance, and more theories come out all the time that fall exactly in line with mine! It's freaky, I really think I'm on to something here, and I think you are too!

EDIT: Addendum: When you refer to the universe as a "book" and the different points in time as the "pages", my theory would say that this "book" is one volume of an ever-expanding series. Turning the page is fourth-dimensional travel (Einstein said that time is the fourth dimension, no different than the others in that out consciousness travels along it), that's the linear past-to-present-to-future progression that we are familiar with. Fourth dimensional travel is merely what we interpret as the passing of time. To "time travel" requires fifth-dimensional travel, that is, actually exiting the book and going to another book in the series.

I like that. Now, it's probably not best termed "science" since it can never be tested intersubjectively (this applies to "multiverse" and also "eternal" descriptions more generally; this is not a criticism), but those sorts of extended space metaphors - which provide a wider context for time - do come up in philosophy and fiction quite a bit, and I think they can be very helpful.

Examples include JW Dunne's The Serial Universe and An Experiment With Time, which take a similar route; Julian Barbour's The End of Time describes a "Platonia" where all moments exist simultaneously. The writings of Jorge Luis Borges are full of these sorts of things - see The Library of Babel and The Garden of Forking Paths, for instance.

What they help us do is free ourselves of the hidden assumption that the world-as-it-is, is of the same format as our ongoing experience - that is, that the world is a "spatially-extended place unfolding in time". Reconfiguring it as a simultaneous and persistent set of "frames" that can be traversed - an "infinite grid of all possible moments", for example - can be quite powerful. In particular, it can encourage us to reconsider what "we" are, as observers relative to the content of our experience (and maybe make connections between time and perception in philosophical idealism and so on).

Meanwhile, I think the common assumptions about what someone who is "only 14 years old" can come up with are often widely off base. My own interest in things like reality, perception mind kicked off around the same time, and in much the same depth. Curiosity is the most important thing - when you're focused on something and put the hours in, very few things are that difficult, if you have imagination.

POST: Try it at home! See the matrix in a laser cat toy.

The speckle pattern? Not a glitch as such, but interesting to ponder because it encourages us to revisit assumptions we might have about our experience. From that Wikipedia entry:

A speckle pattern is an intensity pattern produced by the mutual interference of a set of wavefronts.[1] This phenomenon has been investigated by scientists since the time of Newton, but speckles have come into prominence since the invention of the laser and have now found a variety of applications. Speckle patterns typically occur in diffuse reflections of monochromatic light such as laser light. Such reflections may occur on materials such as paper, white paint, rough surfaces, or in media with a large number of scattering particles in space, such as airborne dust or in cloudy liquids.

There's a nice little summary which corresponds to your own experimentation somewhat, here. Excerpt:

- ==1) The speckle is not on the surface you are viewing. To prove this, hold a pencil at your near point and focus on it while gazing at the screen. The speckle pattern is still sharp! If you wear glasses, take them off: no difference. Speckle is an interference pattern in space caused by the coherent light of the laser being reflected from the rough surface.
- Because the speckle pattern is not located on any particular plane in space, you will have trouble focussing on a laser-illuminated surface; the eye involuntarily tries to focus on the speckle grains. Try reading a printed page by laser light. Try again while moving your head.
 - The apparent "grain size" of the speckle depends upon your distance from the viewing screen and also the aperture available to your eye. For example, if you hold a variable iris in front of your eye, closing the aperture will increase the coarseness of the speckle pattern; the same thing happens if you step further away from the screen.
 - The speckle pattern is sharp regardless of your visual acuity. In fact, you can use speckle as a crude eye test: stand about 2m from the illuminated surface, and move your head slowly from side to side. If the speckle pattern appears to move in the same sense as your head motion (i.e., pattern moves left as your head moves left), you are far-sighted. If motion is in the opposite sense, you are nearsighted. If there is no motion of the pattern, you have normal, 20/20 vision. If you wear glasses, try this test with and without your glasses; if you have normal vision, simulate nearsightedness and farsightedness by holding positive and negative lenses in front of your eye.
 - Speckle is observed only for stationary surfaces. For example, your hand will not display clear speckle, nor will the surface of a glass of milk (use the milk surface, not the glass) -- milk is a colloidal suspension and the Brownian motion of the suspended particles destroys the pattern. This fact can be exploited to detect vibrational motions with amplitude as small as a quarter-wavelength (about 0.15 micron) with the unaided eye.==

So, your final idea that the pattern is "in the universe" is not a bad one - although I would probably phrase it as the pattern being "distributed throughout space" or something like that.

You should have posted this as a question in r/askscience. But do try placing three pencil leads together and creating an interference patten using your laser. That'll get you into theoretical physics and hopefully not in to psuedoscientific woo/ eastern mysticism mixed with perversion of quantum physics... [http://www.instructables.com/id/How-to-perform-Interference-and-Diffranction-at-Ho/]

To be fair to OP, though, I don't think he was in much danger of mangling mysticism and optics. It's really refreshing when people pursue their own explorations into phenomena like this - engaging in structured investigations, being wary of assumptions - since hopefully that critical eye spills over into thinking about glitches, maybe life more generally. And who knows, perhaps it might even inspire metaphors/models that are more useful than the ones that are currently predominant?

POST: [X-Post r/MandelaEffect] Myers-Briggs Personality Types

If there were a correlation, I suppose it might also be that only the more introspective people actually pay attention to, contemplate further, any odd experiences they have - or have an interest in this stuff as a topic. The subscribers to the subreddits might be disproportionately introspective, then, but that could just be a case of those types being more interested in such "fantastical" concepts as part of their richer inner life - and also a general bias in the reddit community overall.

POST: [META] What is the logic behind reality?

The word "real" causes a lot of problems for this stuff, I guess. Most people interpret "real" as meaning "out there independent of me", even though they never experience such a thing. What they actually mean is that the experience corresponds to a particular narrative, fits with a particular conceptual framework (specifically: the "container concept" that is "the objective world").

So concentrating on just the experience for the moment: neither Dad is false in and of themselves, the "falseness" is just a thought of "falseness" we have as subsequent "sensory frames" of experience render the "real Dad" narrative unworkable. Similar, perhaps, to the way "a dream" is really a "having woken up". Until you woke up, you weren't actually dreaming - because "dreaming" as an explanation is the choosing of the "I was dreaming" narrative; it is not part of the experience.

Really, we have to make a distinction between "ongoing sensory content" and thoughts 'about' that content. They are both strands of experience, though; they are both content within awareness. We could view them as being two streams of thought - it's just that one of them is a "bright 3D-immersive" thought ("reality" or "the world") and the other is a weaker diminished thought ("thoughts 'about' the world").

The mistake we often make is to confuse the latter as being identical with the former. However, there is no mechanism-based causal relationship between the two, and there's no reason to assume that the "given" strand is patterned in the same way as the "constructed" strand. Just as there is no reason to assume that the world-as-it-is is formatted in the same way as our human perception - that is, the world is not necessarily a "spatially-extended place unfolding in time", which is the assumption most of our narratives are based upon.

So I suppose the crux of this is the idea of "aboutness", and how this can lead to confusion when it comes to the relationship between different aspects of experience.

POST: [META] Collecting common glitch report themes?

Having played with this a little myself (I am a mod here), it's actually really hard to group them in a way that makes sense; going through them, you find that whatever the "underlying" of the glitches is, it's not mapped very well to object-based categories.

At best, one might map them to groupings like: "object location", "temporal location", "object form", "abstract facts" and so on, but they are so broad as to become fairly meaningless. Very quickly you realise they all resolve to something like "a discontinuity in the formatting or content of subjective experience".

Of course, that conclusion, and the difficulty of categorising glitches, is itself is a pointer to the nature of glitches.

POST: Oranges.

[POST]

I haven't eaten an orange for over a year maybe. Used to eat them all the time they were around, but stopped for some reason. Today I decided "hey, I should eat some oranges". So a couple of hours ago I bought oranges and brought them to the house, but haven't eaten one yet. Instead, I started reading a book that's been sitting on my hard drive for a month. I wanted to read it for some time, but only started today for some reason. Guess what the author wants me to do? This:
...imagine that you've just arrived from another planet and have never encountered an orange before. Now take a few minutes to experience a piece of fruit in a fresh new way
Oh, and the book is about meditation.

[END OF POST]

It's called the Baader-Meinhof Phenomenon.

And... how does that work, exactly?

If it's just a name or category for experiencing a clustering of a certain pattern, then great, but I'm not sure it adds much in terms of being an explanation (if that's what was intended). It's surely the start of a conversation, rather than a conclusion.

For example, if the model is that the thought of "hey, I should eat some oranges" caused him to "notice" more instances of oranges, even though the background population of instances was unchanged, that's an interesting idea. However, we have no access to an untainted dataset independent of a subject's "noticing". We can't differentiate between "the thought caused him to notice what was already there" and "the thought actually increased the number of subsequent instances of oranges".

Although your theory might be plausible in terms of the usual narrative of the human-world experience, it is unfortunately non-scientific, since it is impossible to test.

Even if we had someone else as a "control" prior to and during a test subject's exposure to an orange reference and their observation of subsequent instances, we couldn't discount the possibility that the control's instances were being modified by their orange-focused intention.

you are spot on, as usual ;-)

Wait - are you sure it's not just that you witnessed me being spot on once, and now confirmation bias is leading you to see me being spot on all the time? ;-)

...

Well then, that's that.

Well, someone's given it a name now, which means there's nothing more to discuss.

Did you know that the reason unsupported objects drop to the ground is because of "Falling Down Phenomenon"? People used to spend lots of money investigating ideas like "gravitational waves", until one day they realised there was a much simpler three-word explanation for what was happening, and that everyone could just go home.

We named it gravity. And yet we're just as clueless as we have always been.

Yeah. Well, at least we went a bit further in terms of constructing a useful narrative, rather than just calling it a name and stopping there. Although "gravity", as you are implying, is really the name of the narrative, and not something in "the world as it is". It's not very fashionable to draw a distinction between our descriptive fictions and "how things really are" at the moment, though.

Really, my reply was more directed at the commenter than you - and not necessarily intended to start discussion. So feel free to ignore. :-)

Every report of this type gets a few people stating the names of a couple of psychological phenomena as if it is an explanation, often out of context, without actually connecting it to the post. The implication is that there's nothing further to discuss, and that there'd be no point in people sharing similar experiences because they "are just" <insert-name-here>.

I disagree.

It's okay! I came here from /r/findareddit where I asked about a sub where I could share such experiences and read about others who had them, without all the explanations. I love science and build my worldview around it, but I'm tired of people waving away any genuine human experience just by mentioning some XYZ effect.

Well, you are in the right place I think! Generally speaking, this is a pretty welcoming sub that is indeed mostly about gathering and sharing accounts of unusual experiences.

Beyond that, yes, it encourages discussion based on standard or more esoteric ideas - to let the thoughts go where they may, mainly for the fun of it, but definitely not in order to dismiss the experience. Unfortunately, a small subset people are a bit too keen to "explain away" things based on a concept they read in a popular science article, for example, without really offering an account how exactly it explains OP's story. This tends to be a bit of a conversation-stopper, hence my picking up on it (as a moderator).

You can just not engage with that. :-)

Did you read the linked article? It more than names the phenomenon:
From the article's summary of Stanford linguistic professor Arnold Zwicky's attempt at an explanation or "useful narrative": It's caused, he wrote, by two psychological processes. The first, selective attention, kicks in when you're struck by a new word, thing, or idea; after that, you unconsciously keep an eye out for it, and as a result find it surprisingly often. The second process, confirmation bias, reassures you that each sighting is further proof of your impression that the thing has gained overnight omnipresence.
Not trying to be a dick but there is an explanation in the article, more than just a name.
Edit: fixed typo

Not very convincing, is it? It's really just a restatement of the assumption! How can we differentiate between this and there actually being more oranges?

Also, what does it mean to "unconsciously keep an eye out" for something? Isn't that saying we don't detect doing something but we are assuming a process for narrative convenience? For confirmation bias: again, isn't this meaningless unless we have a raw "environment dataset" and an "observed dataset"? Is BM not just an empty pseudo-science story with no solid foundation?

Which isn't to say I'm promoting an alternative account, only that there's not much reason to support this one vs leaving it as an open verdict. Not trying to be a dick either - just pushing things along a bit! :-)

POST: [Theory] Why do we only hear "quantum immortality" stories from the "immortal" person's point of view? Why do we never hear "my loved one had a brush with death and now they insist that Thing used to be way X when it's always been way Y"?

I have a difficulty with quantum immortality, as it has been told to me:
If I jump into another reality when I come close to death, then in that other reality people may see me as dead, right? But in the new reality, what was going on with me for the duration that I was in the old reality? Did I just take over someone else's experience and life? Did I kill them? Even if you want to say they are both me, and I'm just switching camera views or something, it still stands that the person in the new reality was having conscious experiences before I took them over, and now they are not. Unless you want to say that we are both sharing conscious experiences, but without knowledge of the other one sharing them. So which conscious experience is controlling the action? And if that body in the new reality has a near death experience, then it must jump to a new reality, and now you have 3 conscious experiences of 1 bodily experience and none have a right to control that experience. This could happen over and over again, with more and more consciousnesses occupying one body. If you want to say that the new reality doesn't exist until you jump into it, then you must assume that nothing in your experience is really there, and be a solipsist. Anyways, I just don't think it makes any sense. :/

A way out of this is to stop assuming that the format of the world is of a "spatially-extended place unfolding in time".

If instead, we are dealing with a pre-existing collection of "all possible sensory moments" across which we scan our attention, then we no longer have the problem of new and old realities and taking over people's lives. There are no people, as such, only that-which-experiencess. And there is nothing "happening" other than experiencing-of-moments.

Other realities aren't places, they are static moments. They don't "happen" when you are not experiencing them.

This is solipsism is the sense that "only mind exists and all possible experiences are within it", but it is not the same as saying only me-as-person exists, and so is less problematic I think.[1] In fact, it ties up nicely with your actual direct experience: all that you ever experience of the so-called "external world" arises within your "open aware mind-space"; this includes all your thoughts about the "external world"; you never experience any boundary to your mind-space.

So, the evidence supports this view in terms of the context of experience. The content of experience is actually irrelevant in a way, since in this view it becomes a sort of "3-dimensional sensory theatre" drawn from an eternal record, which can't tell you anything about "how things are really" (the context).

Finally, there is therefore no fundamental reason why an experiencer can't skip to a set of moments whose content conflicts with previously experienced moment. Integrity with respect to history is at best a habit of moment-selection, not a rule attached to a "universe" as such. And this may even mean having experiences of commenting on subreddits about how our experiences conflict...

[1] There could be any number of "experiencers" in theory. However, it makes no sense to talk of experiences happening at "the same time and place", since "times" and "places" are aspects of an experience, and are meaningless outside of an experience. Also, all experiencers would be identical really - all just an open experiencing-awareness - so there would be only one of them in effect, since experiencing-awareness would be "before" division, contrast and multiplicity. Hence an alternative phrasing: you will "eventually" have all possible experiences and everyone is effectively you, although not at the same time. Although also: kinda at the same time.

EDIT: Slightly long-winded, but I wasn't quite sure exactly which aspect you were picking up on. Solution: type a lot.

it is because time and location are aspects of experience that it makes perfect sense to speak of them in relation to experience, especially if you want to make argument s about how experience could shift between worlds.

Doesn't this separate "the world" from "experience", however? Note: I'm not saying that discussing things in terms of time and space is pointless, only that it is not meaningful to talk of time and space "between experiences". Actually, it's probably beneficial if we rename "time and space" as "change and division" when referring to experience itself. To have an experience of something, those are requirements. And so to have an experience of a "world", the content of our experience must be so-formatted. What we tend to call "time and space" is really something we infer from the experience of "change and division".

Anyway, the footnote is emphasising two things: First, that some of the difficulties people encounter when thinking of solipsism arise due to thinking about the context as if it were content. Second, that it is not meaningful to talk of shifting worlds using the language of worlds themselves. For as long as we are thinking of a world as a "place" that is "out there", treating that as the fundamental truth, then we will misunderstand the nature of experience and so of world-shifting. It may be relative truth (you have an experience "as if" such-and-such was the case), but the fundamental truth is unchanged (of an aware-experiencer who is having an experience of being-a-world-from-the-perspective-of-a-person).

For example, say the house next door is painted red and the guy who owns it is called "Robert" (and everyone calls him by his full name because he hates contractions). One day, I wake up and see that the house is blue. I notice that everyone calls the owner "Bobby". Everyone claims that these two facts have always been the "new way" and only I remember differently. It is "as if" I have switched universes!

But what does that actually mean?

Well, what I actually experienced was a discontinuity in the content of by experience. I didn't actually experience "switching universes", that's just something I infer from a conceptual framework I have. In fact, the notion that I am even "in a world" is also something I infer from a conceptual framework. The notion that the room next door is "over there" assumes that the world is formatted like - is a continuation of the formatting of - my ongoing experience. And even then, only a part of my ongoing experience (since it is relatively easy to have spaceless-timeless experiences).

What are the implications of that?

It simply means that it is meaningless (but not pointless) to talk of time and space between worlds, or of worlds being "located" in any way - because a "world" is a concept inferred from a collection of similarly-structured moments, rather than a place.

In truth, if I pay attention, my actual experience is of being an "open aware space" with a constantly changing "3D multi-sensory image" floating in it, one aspect of which I've fallen into the habit of calling "me", and the rest "my body" and "the world". Anything beyond that involves thinking in terms of "the view from nowhere", which immediately means I am "already wrong" since that objective view can never be experienced; it does not exist. It is a connective fiction, an abstraction. Again, that doesn't mean it isn't useful - but for structuring purposes rather than finding the truth of the situation.

I'd say it's not that there can't be a discussion about it - it's just a matter of being honest with ourselves about the nature of our descriptions?

I don't think we benefit from viewing our abstractions as actually true rather than being fitting narratives. It can even lead to us defending things which are essentially fictions, after they have outlived their usefulness. When talking about this stuff, I think we reach the limit of the fiction of the "objective world" container, and we have to adjust our approach accordingly.

As you indicate, if we insist that our narrative about "what is going on" must be in terms of "time and locational and individual experience" - even though we will never be able to make a direct observation to confirm this - then we might be effectively preventing ourselves from creating a useful narrative. We may even be making some experiences completely unexplainable in terms of our ability to create a model. It's like only looking for your lost keys under the streetlight, even though you have no idea where you dropped them!

I think 'glitch' experiences and 'quantum immortality' models are very vulnerable to this - hence all these "what happens to the people in the other timeline?" questions and similar. Those questions aren't actually questions based on experiences, they are questions based on a certain conceptual diagram (the timeline) or two (the cartesian co-ordinate system) which has been conflated with individual experience. It's the assumptions of the model that is creating the problem, and in this case those happen to correspond to unexamined assumptions about the nature of experience itself...

So, where does that leave us?

Actually it probably leaves us with more possibilities for coming up with explanations that connect to direct experience than ever before. Because we:

1. Treat the unchanging context of experience as fundamental (our "open aware perceptual space").
2. Treat the changing content of experience as primary (the 3D-sensory experience that arises within perception).
3. Recognise that everything beyond this is a connective fiction with a certain number of observational touch-points.

Freed from treating our abstractions as actually true, we are also freed from requiring that the nature of experience and the structure of experience must correspond to the format of the content of experience. (Avoiding the reification of abstractions, basically [<http://www.ehu.eus/aitor/irakas/mes/Reference/mermin.pdf>].)

POST: [Meta]Sight/Vision is just a mental hallucination

Can we talk about how basically everything we see is in our brains?

Well, if we're doing that we should probably talk about how even our brains are in our "brains". Where do we draw our philosophical boundary? All our evidence about the world arises in our mind, that is certain, and we never experience any "outside" to our mind. This includes our ideas about the world too. In that sense, everything is in our "brains". This might lead us to ask...

Even things like the television use three basic colors to create the illusion of multiple colors, distance, depth and movement when none of those things exists in that medium.

...is the world itself just an illusion in much the same way? Perhaps none of the things we perceive around us "exists in that medium" either. Are we exploring the formatting of our own minds, rather than the formatting of a world? The world itself, as it is, might be largely unstructured, to a greater or lesser degree. But to what degree?

Are we not influencing it as well?

The degree to which we can influence the world, would depend upon where the boundary lies that divides "formatting of your mind" and "formatting of the world". There would be no way to discern this, though, other than by experimenting with trying to make changes. Simply observing the world via mundane interactions, as we do in most science, would only tell you how things are right now; it would not reveal the limits of how it could be, surely?

So, what experiments can we do to discover the position of the "boundary of influence"?

Related: Darkroom Vision

POST: Did the matrix help me get out of my driving lesson? There's no such thing as a coincidence if you ask me.

What you need to look out for are those occasions where things don't work out in your favour...

One potential problem might be, if the looking-out-for itself shapes our experience, then there's just no way to win - and that doesn't even required the act of looking to be "causal", just "filtering". To expand:

Although we might imagine that there is an external world out there, an independent stable dataset, and our cognitive biases mislead us, we never have access to that external world. We only ever have access to our cognitive biases. In effect, our cognitive biases are our experiences of the world - our patterning is the world.

So, if OP starts passively noting goods days, or bad days, or every day, the experience that they have will always be "coincidental" in a sense, since there's always going to be a presupposition involved, from this point onwards. There is no way for them to be "objective" about this.

The only way they might test this, I suppose, is to actively explore the possibility - by booking a strip of weekly driving lessons, and then each week "wish something would happen so I didn't have to do this lesson". If the results are consistent, then there might be "something" to it. (Although of course we'd have no idea as to the nature of that "something", but that's not required initially - just the observation of a consistent repeatable effect.)

All down to OP now.

POST: Hold your horses.

If this actually is a case of quantum immortality, how would you have noticed it? Everything you remember is stored in your brain, which, if parallel universes exist, is separate in each universe as well. If you die in one universe, your consciousness might move to another universe, as that's not something physical; nobody knows what that is. But your memories of the previous universe wouldn't move; that would require the information stored in your brain, which is physical, to spontaneously change as a result of something happening in another universe. That wouldn't be a "change" from your perspective, but within that one universe (which is what the laws of physics are bound to) it would be. So if this were to happen, you'd simply forget everything from the previous universe and remember everything from the new one, as if that's how it had always been. (And yes, this means it might have happened several times in your life without you knowing.)

Besides, if that were possible, wouldn't you see it happening with other physical objects that store information as well, not just brains? If your computer's hard drive is destroyed in a parallel universe, would the data on the drive platters spontaneously change in this universe to match the data from the other one? I know your computer isn't conscious (actually, come to think of it, I don't; as far as we know anything could be) but if it was, why would that suddenly enable the data on its hard drive to change through non-physical means? The same principle applies with your brain.

I think what most likely happened is that your wife suddenly remembered a repressed memory or something. The near-accident might seem like it was related due to the

timing and significance of the event, but correlation does not equal causation. The human brain can do some very weird things, especially when psychological trauma is involved. Do you have any records of previous conversations involving the expression "hold your horses" that you can show her? Like voice/video recordings, or text messages?

I guess the assumption you are making is that these universes are "spatially-extended places unfolding in time" - or more specifically, you are making the assumption that because your sensory experience is formatted as a "3D space with stuff in it", that this is the form of the world itself. This might not be the case. The images you see do not necessarily arise from a "behind the scenes" place that is of the same form.

One of the follow-ons from this is that the "brains" are part of our experience, not necessarily the world as such - which means they are not causal, because the world we see is not causal either. Our apparent world is sensations, one after the other. We make the assumption that the brains we see correspond to brains "behind the scenes", but it is an assumption (arising from the other assumptions). The image of a brain wouldn't store anything, of course. The only real storage would be in "that which experiences". But what is that?

Actually, if we pause and attend to our experience, we discover that our direct experience is not actually of being a body in the world, rather it is more like we are an "open aware perceptual space" in which our experiences arise - consisting of sensations, perceptions, and thoughts. In other words, although for convenience we treat the world as being external but directly accessed, all we ever really experience are sensory forms arising in this "mind-space" of ours. We might have thoughts about an "external" world - laid out in space, in which we see brains - but those thoughts also arise in that mind-space. We never get outside of it. "Outside" is just an idea we have inside. It is then not at all clear that the mind-space itself is anywhere, since it has no perceivable boundary, and therefore can have no location.

So taking all of this into account, if we "jump universes" then we wouldn't be going anywhere. What would be changing is the content of our experience; we would be "selecting" a new set of sensory images to explore, for and from and as the "inside". Whether you would still have access to your old memories, ones that would now be inconsistent with the upcoming experiences, is debatable - but it would not have anything to do with "brains", as such.

POST: 'New' house on my old block.

Q1: I've said it once, and I'll say it again. The Berenstein theory comes because The Simpsons showed it the way people always remember it, when referring to it, rather than the way it is actually spelled. Edit: Huh. And now the image that said Berenstein from the Simpsons, when I looked at it a couple months ago now shows Berenstain on google.

The episode of The Simpsons with this in it is "The Fat and the Furriest". At 09:10 onwards in this video of it you can see it says "The Berenstain Bears". The still images you see online with "Berenstein" are just people having some photoshop amusement with themselves, because of this very thing.

*Q2: You can find it both ways if its the image I'm thinking of...
[https://img.4plebs.org/boards/x/image/1402/60/1402602476521.png]
:edit: spelling*

Q3: there are 2 images that exist online but which one was in the show? ain?

At 09:10 onwards in this video [Dead link] of it you can see it says "The Berenstain Bears".

yeh, I figured someone probably p-shopped the "ein" image lol

Yeah. Hence the endless stream of posts where people claim to have "solved" the bears thing after discovering a "misspelled" image via Google. Like nobody thought of googling for this before!

I think a lot of people who are just barely stumbling upon this whole thing don't yet grasp the concept that even if it WAS "ein" for them.. that RIGHT NOW.. every instance will be "ain".

True. At first they're just "everyone knows memories are fallible, you guys are crazy", because they are assuming that people are just talking about something they "just kinda thought it was this way", rather than had direct contact with.

I eventually wrote a definition for the Mandela Effect sub, to try and emphasise the "direct personal experience" nature of it (regardless of any particular proposed explanation) and that it is "as if" a fact of the world has changed from underneath you:

DEFINITION
"The phenomenon where a group of people discover that a global fact - one they feel they know to be true and have specific personal memories for - has apparently changed in the world around them."

But people don't really get it until they have an actual experience themselves, and suddenly it changes for them: "I came here to mock you guys but then came across <insert example> and had my mind blown", is typically how it goes down.

Still, that's quite interesting all by itself, I suppose.

POST: I think God may have finally reached out to me.

Stepping back for a moment, it might be worthwhile separating out the experience from the explanation. Obviously there's the "it's just a coincidence" explanation, but let's ignore that for the moment...

Putting that aside, what definitely happened is that you requested an experience of "knowing that someone is out there looking for you", and then subsequently had such an experience. That's the content of the experience. The nature of that experience, is still up for grabs.

You can interpret this as an "Entity God" or something else listening to you and sending you a message - but equally you could interpret it as an an intention (from the desire to experience knowing something) followed by a result (the experience of knowing). If you'd asked for the experience of knowing that the devil was taunting you, or knowing that the NSA was hunting you, the corresponding evidence for those might have arisen, as requested. On the one hand that might seem a bit disheartening - on the other hand it means you have deliberately created a glitch-like experience for yourself, via intention!

Playfulness aside though, you should just go with whatever explanation feels most useful to you (you can always change your mind later). In lonely and lost times, little glimmers of inspiration can make all the difference, and you should let them work their magic when they appear. Glitch or God, who cares so long as it's helpful?

...

Q1: I was talking to God about how I just wanted to know that someone was out there looking out for me. I kept asking for a sign because I felt like I was talking to myself. I consider this a delusion, but if it helps you find hope, then it is well worth it.

A1: It's interesting how this subreddit completely accepts the idea of "slipping temporarily between dimensions", or going through a temporary form of time travel randomly, but someone saying that an explanation could be God, or reaching out to God is delusional. I'm not saying you have to be religious, but come on.

Q1: Am I not allowed a personal opinion? I believe the concept of a god is a mental delusion. That doesn't mean it doesn't help some people with their interactions with reality. I'm of the mindset that if a god exists, he can't convince me of his/her/its existence without forcing my mind to believe it. That doesn't mean that I don't believe that odd, unexplainable things happen. I just find that relying on a god for the explanation immediately hinders further, actual research.

The concept of a god can't be a delusion surely; it depends more on what that concept represents. I agree that stopping further investigation due to that (or any) concept is a missed opportunity though. It's the equivalent of saying "just... because".

It's not my cup of tea, but I still drink from time to time.

I like that angle.

I'm inclined to think that all conceptualisation is "delusional" thinking, if it is seen as being identical to what is actually happening. So long as you recognise thoughts as being what they are (thoughts), and your explanations as "connective fictions" to link observations together, all is well. As soon as you start thinking that it was "God" that really did it, or that "Gravity" is a real thing that somehow "causes" objects to move towards each other, you are being delusional. Of course, forgetting that "Gravity" is a just a conceptual framework (albeit a very useful one) isn't nearly as likely to cause you problems in daily life as other things are - particularly because the raw observation "people who fall from high places tend to die horribly" is pretty persuasive all on its own when it comes to decision-making. So some types of delusional thinking cause less trouble than others. An open mind, though, hopefully recognises their fictional nature and is always accepting of other, better descriptions when they come along.

Yeah, so, explanations and descriptions are useful or not, they are never "true" - thinking they are is delusional.

Q1: so how would i go about 'forgetting' gravity and forgetting that i can't teleport anywhere of my choosing or materialize objects etc?
[<https://twitter.com/loopautoseal/status/667575092273160192>]

That's certainly an interesting question which raises all sorts of fascinating philosophical issues.

Q1: again, none of it matters because clearly whatever i think and do is wrong, otherwise i wouldn't be experiencing life...

What is your reasoning for that conclusion?

Q1: because what i want is unknown until i've exhausted every other avenue of action and the experience i make comes about at that point of near-despair.. which makes the in-between time-period distressing, but i realize that that period is there only so that i can 'see' the real nature of reality: that everything comes about as a result of one's desire. and any speculation and action leads nowhere useful because i can't see where i want to be until i've got no choice but to experience what is required, so the entire process is a useful-useless tool, if you get what i mean...

Actions themselves don't accomplish anything, if all you intend is the experience of doing the action. And if you instead intend a desired state, you have to get out of the way and let movements arise without opposition as experience unfolds towards that state - basically "be okay with whatever happens" - because you can't know in advance what the connective is experience is going to be. (You can't "pre-experience" an experience, otherwise it would be the experience.)

This is good and bad. One the one hand, it means you must have "faith" that things are going appropriately, even though you cannot conceive of how that is so. That can be uncomfortable, because it requires that you are okay with "being moved" rather than being in moment-to-moment control. On the other, it means you don't need to bother "working things out" because it has no bearing on the actual outcome - the causal link between apparent actions and outcomes is illusory, only intention (or the assigned meaning of an act) matters. So eventually, the idea is that you recognise that you always give up in the end, often through despair and exhaustion, so why not just give up at the start instead?

right, but how? doing the non-doing is still a conscious effort, otherwise i'd have no desire to experience

There are two things we're talking about here I think: a) non-doing, b) changing state. Excuse the slight rambling:

a) Non-doing is ceasing to interfere; it's not something you do at all. And when you cease interfering, your experiences will play out spontaneously from your current state. It's like having ripples in a pool of water, and stopping splashing or countering the direction of the already-established wave pattern. In this context, we can view desire as the temporary state of resistance that prevents "over here" unfolding to "over there" - it's like constant intending to prevent of the movement of the waves via holding on. When you cease interfering, then desire will fade, as the state shifts to accommodate it, as the desire pattern becomes integrated into the overall wave pattern. There are no guarantees about the form in which it will arise as an experience, or when, since it will be incorporated into whatever other structure or "facts' make up your current state.

b) Changing state is how you actually modify the patterns directly. You do this simply by intention - which means holding an unbounded thought in mind, rather than a thought about it. However, the more established the pattern, the longer you will have to hold that intentional pattern in mind, and the more foundational a pattern, the more involved this is. Having done this, you will have shifted your state, and your subsequent experiences will therefore automatically be in line with this.

So to just clarify - "Non-doing" means not interfering with the experiences arising from your current state. It doesn't mean experiences stop, and it doesn't mean that intentions necessarily instantly have effect, because you have deep patterning already present. Having said that, the longer you remain as a non-doer, the longer you have ceased to reinforce or re-trigger existing patterns, the more flexible and responsive things become.

Additional thought - What you "desire" isn't always the same as what you "want" as apparently described by passing thoughts.

Q1: right, I find that if I want something - e.g. I want a robot to behave in a certain way - it opposes me (even going so far as to tell me that it has no power over me but still adamantly refuses to do what I want) until I later on assume that the preferred outcome has already happened and then things occur much as I'd wanted. I'd class that as trivial yet depatterning. so to bring to me what I actually want requires holding the unbounded thought in conscious.

Yes, good example.

POST: [THEORY] Theory of everything

Some thoughts on solipsism-

Yeah, it's definitely solipsism in the broader sense, in that all that can be directly known is "your mind" (avoiding the word "self" here, which has become muddled in use). But that doesn't necessarily mean we're talking about a personal mind, one that belongs to a person, because "being a person" is something you have an experience of, it's not something you are.

It's saying that all you can ever know fundamentally is:

- That you exist.
- That you are having experiences.

And really these are the same thing: that "you are experiencing". Any thoughts you have about experiencing, are also experiences. There is no "outside" to experiencing. It is meaningless to talk about what you "are", other than that you are that-which-has-experiences.

However, beyond this fundamental truth (the nature of experiencing, the context), which cannot be conceptualised and so there's not much to say about it, we can talk about relative truth (the shape of experiences, the content) and the conceptual frameworks we construct in parallel to describe them. We can investigate the content and make up stories about it, but those are all "connective fictions". And with a (semi-)solipsistic view at the context, we won't be in danger of confusing our descriptions for the actual context.

This is recognising the error in assuming we can have an experience about the structure of experiences. Even the concept of it having a "structure" is incorrect, because structure is an experience, and whatever it is, is "before" that. It's like trying to make a sandcastle which accurately models "sand" (or more accurately perhaps: that tries to model the colour "sand-yellow"). You can be sand, taking on different shapes of sandcastle, but you cannot take on the shape of sand. You can be sand-yellow but you cannot take on the shape of that colour.

This immediately dispenses with the 'simulation' hypothesis, the 'objective world', and all other notions of an external solid substrate that arranged in space that underpins experiencing, as anything more than fun "what if?" ideas that can never be proven. Although there might be an extent to which experiences might be have "as if" such things were true, the things themselves can never be examined, as contexts.

But what about "everything depends on your beliefs"? -

Well, there is no inherent structural reason why this couldn't be the case - the bunch of models or narratives we have are just our own fictions, they are descriptive rather than causal, they arise from a small subset of our observations-to-date, and do not really forbid anything. The only way you could know for sure is to adopt different beliefs and see how that affected the content of your subsequent experiences. Perform experiments.

Having said that, it would seem like a good idea to have some sort of definition for what a "belief" is. Is it "thinking that something is true"? We are surely talking about something more than an opinion here. The literal formatting of one's mind by a "fact-pattern"? Could there be such a thing as "intensity" of belief or an "adopted fact"? How would one adjust the intensity of such a pattern, and explore its effects, if any?

Life may be a reflection of our beliefs, or a combination of our beliefs and some other substrate or belief system. We have to be cautious with what we assume, but liberal with what we accept as possible.

That's very nicely phrased.

One metaphor I enjoy is viewing our experience like a stack of patterns laid on top of one another, like moire fringes. Think of each pattern as a "fact of the world" that formats the open perceptual space within which all our experiences arise. Some of those facts are quite high level ("the sky is blue") some of it is more like formatting (the organisation of our senses) and some even more abstract ("spatial extent and location" is a fact; "time passing" is a fact. Taken together, we have a static pattern which is the basis of the apparently unfolding content of experience.

Actually, we might think of all possible fact-patterns always being present in the stack, but just differing in their level of intensity or contribution. The distribution of intensities would be our current state, or the state of the world - the list of active facts and their relative dominance.

Now, this means there is no inherent restriction to what can be true in experience. However, since the current state is a single continuous pattern, it must always be logically coherent. It must always "make sense". This simply follows from its nature.

And so we have that: Yes, it may be possible to fly. However, it might not be possible to fly without changing state. It may not be possible to fly while your experience is human-formatted and you are living in a world like this, because to update that fact will involve quite dramatic changes as "collateral shifts" - like changing the shape of one fold in a blanket of material, and that act necessarily involving pulling on the rest of the blanket, and the shifting of the other folds.

Further musings -

What does this mean for beliefs?

Well, perhaps beliefs correspond to pattern-facts, and if we truly increased the "contributing intensity" of a fact it would indeed become truth in experience. Perhaps simply by sitting down and asserting vigorously a fact, once could increase it's dominance. However, practically speaking that might mean you are trying to shift the state of the entire world - unless you can find some way to isolate that pattern from a general fact.

And if this could be done, then the "open perceptual space" that you are might no longer be aligned with others' lists of facts, and you would cease to overlap with them. So, you would be experiencing flying around the clouds with your friends... while simultaneously they would be experiencing having a beer and a BBQ with you in the garden, firmly grounded.

TL;DR: I like it. But it is as hard to pin down as the belief in any god or the simulation theory, etc. Which means we aren't any closer to resolving the issue than we were before (but it might be a useful theory in the future).

Perhaps the problem amounts to: how can you confirm the nature of experiencing? And the answer is pretty much: you cannot. Or at least, not in the positive, not by performing an act.

So initially anyway, this is a negative description of experience. It suggests what is not true - by which I mean not fundamentally true - and it highlights what is meaningless to pursue. What it does do, is provide you with a boundary-free way of conceiving of experience. It says: there is no "how it is really" at all in terms of content. From there, though, we can push forward...

Recapping, we have something like this from a subjective perspective:

- What you truly seem to be is an "open aware space" in which experiences arise. (This is directly knowable.)
- All possible fact-patterns are "dissolved" into this space. (Metaphor.)
- The relative "intensities" of these fact-patterns correspond to the static state of you-and-the-world. (The current "list of active facts".)
- Your ongoing sensory ("the world") and shadow-sensory ("thought") experiences arise from that current state. (To modify the state would be to modify the experience.)

The way to confirm this setup would be:

- To satisfy yourself by direct observation that you are in fact an "open aware space".
- To deliberately change state and observe that the subsequent content of experience corresponds to that modified state.

The first, I suggest, is easily done. The second requires a bit more pondering. So, how do we change state? Can we change state? If we were follow up OP's ideas, then our first port of call would surely be to identify how "beliefs" fit into this model, how they are related to "facts", and how exactly we might modify beliefs to see if it results in observable changes in experience. (Additional concept we might choose to introduce along the way: intention.)

==So, some interesting observations:

1. When I am in a bad mood, it colors how I see everyone else behaving around me. They become more sinister, more reflecting of my mood. This is evidence that belief can effect perception.
2. When LDing, it can become easier to confuse reality and dreams in small instances. Dream verification checks can counter this, but the feeling of living the dream re-enforces the idea that life may be like a dream. One of these individuals may truly believe they can fly like they do in their dreams (much like some drug users may believe they can fly). However, they are not observed to fly in the physical reality, and confrontation has shown they will readily admit they can't fly, but believed they could.
This seems to counter the idea that belief changes physical reality, but not the idea that belief colors perception of reality.==

They could both be a reflection of the (potential) fact that your belief changes reality.

First, let us consider that "reality" is a concept - by which I mean, the notion that there is a "baseline" and that your perceptions are a modification or filter of that (even though you will never experience the baseline). What we are talking about here, is depth of change. Our general assumption is that "reality" is pretty much world-shaped, and that perception is a small adjustment of this. What if "reality" was of no shape at all, basically an "infinite gloop", and that perception was the entirety of the selection or shaping component? This leads us to...

Returning to our idea of the "relative intensities of facts", in your dream the relative intensities are close to each other. The highs and the lows are not very far apart, and hence easily adjusted. Turning no-fly into yes-fly is a minimal adjustment from peak to trough.

Meanwhile, in waking life the peak-to-trough is much greater - facts are "more intense" - so a much greater adjustment of the intensity of no-fly is needed. A simple decision or an "I can fly!" thought makes minimal difference. However, fact-patterns that are more shallow and whose alteration is less world-breaking are much more susceptible: your bad mood and the "everyone is evil" thought is hardly a change at all, and is easily within the fuzzy adjustability zone of "plausibility".

For the sake of argument, if we say thoughts are basically "intensifying a fact-pattern" and intentions are a type of thought consisting of strong "assertions of fact", then the extent to which our experience will be modified will depend upon how much our state is shifted relatively speaking, which in turn depends on how intense the fact or counter-fact already is.

So then we should be able to measure these peak to trough sizes for a variety of situations for a quantity of people. Perhaps using hypnotism? What we are really measuring, then, is the discrepancy between physical and mental, or how much mental influences physical. In my first scenario, mental is only influencing mental. If I build an airplane, physical is influencing physical directly, and mental is influencing the ordering of the physical (another non-physical trait, since that organization is only assumed organized by the mind). What we want is for the mental to directly influence the physical. We have a map where we think the mental is represented in the physical (the mind holds the mental, or at least translates it into the physical and the physical into mental). Perhaps there is something in our bodies we can examine to discover the separation and connection between physical and mental? If we know their differences, we can probably also find how they effect each other, and how to improve or hinder that effect to accomplish something.

One of the issues with that approach, is that the model says that the mental/physical division is not meaningful. They are both just experiences arising inside the "open perceptual space", which itself has no outside. One might say that the experience of the physical world is like a particularly bright strand of thought, one that is quite 3D-expansive and unusually stable - but it still occupies the same space as any other thought you have. Mental and physical differ only in stability, brightness and 3D-immersiveness - not in kind.

So we can't really measure the "intensity of facts" objectively, because the notion of "objective" isn't meaningful here. And if we hypnotise other people, for example, what we are doing is creating an "experience of hypnotising someone" within our own experience - which of course is shaped by our own beliefs. No matter what we do, we are in effect dreaming. Any action-based experiments you perform within a dream-world on a dream-world, are dream-experiments, and yield dream-results. We might think of ourselves as the "dream space" here.

But what we can do is experiment with ourselves. Not via actions perhaps, because all our action-experiences will arise from the current state, and will be consistent with it, when what we are trying to do is change that state. Could we instead proceed via intentions...?

This is ignoring the observational evidence of a separation between mental and physical. Though the theory claims there is no real division aside from intensity, physical reality shows some sort of division. Whether that division is merely the difference between a system that watches 5 Volt fluctuations versus 500 Volt fluctuations (just an example of a system type that can depend on fluctuations of intensity), we still need to discover what the mechanism of that separation is. Once we know HOW these two observable levels of interaction are separated, then we can learn the mechanism to span that separation. The division of mental / physical is meaningful because it is observable, not because it is an accurate representation of the underlying forces. We are trying to discover the underlying forces, but we only have the observable to work from, so we use what we have.

I'm not so sure about this. What exactly is the observational evidence of a separation between mental and physical? Can you expand on that?

Imagine a house. How big is it? No matter the size, how much space did it take up in physical reality? It didn't take up any perceivable space, therefore it must not have been a physical creation (for this physical reality, anyway). Next, try to move an object with your mind. Imagine it moving, or do any number of things you can think of to move the object using your thoughts. If the thoughts don't have a physical component (you spoke to someone, you moved your body, you used a special device that monitors electrical impulses in your brain to move a robotic arm), it seems, at this juncture, that you cannot move the object. That is the visible separation we see. The mental can create vast images and experiences, but they don't last, and often have poor resolution and/or dissolve when examined or ignored. They also take up no physical space (from what we can tell). The physical can move things and mimic things, but doesn't seem to be able to produce spontaneously (like visualization), though it is quite resilient to observation, scrutiny, and being ignored.

So, we're distinguishing between the two based on apparent properties, not necessarily by nature (since both appear in the same perceptual space, even if apparently in different "parallel-simultaneous" places sometimes).

If we return to the idea of different strands of thought arising in the same space, with one (which we label "physical reality") being more persistent and intense than others (the other thoughts we have) - would we necessarily expect a "parallel" strand of thought to affect the main one?

When I move my arm, do I not "intend" its motion? Is that not the same as modifying the main strand of thought, by basically thinking the "arm movement" pattern into that strand? If I just think about moving my arm, it doesn't have the same effect, because the thought about it is in a separate strand.

Meanwhile, does a "physical" house really take up any space? How much space is the room next to this one occupying right now? Is it not the case that spatial extent is part of an experience, and that we just assume that the rest of the world is laid out in space in the same way as our experiences are formatted?

Looping this back to belief: Is the problem with effecting large changes perhaps due to a mix of: a) the relative intensity problem noted earlier, and: b) that we often don't "think-intend" into the stand of thought we are wanting to change, and instead we start a new strand about the change.

Okay, for the first part -

Let us reintroduce that old standard: lucid dreams.

When lucid dreaming, although often lucid dreams are vague and unstable, it is actually possible to apparently create or go to a pre-existing (via creation by implication) environment that is stable and persists and can be revisited (for optional reading, someone did a nice write-up about this: "Persistent realms and other lucid dreaming techniques I use"). In all respects, it is another "physical world" and is recognised as a dream perhaps because when there I have memories of being here, but when here I do not have memories of an experience which precedes this one.

Going with this, then we have a set of experiences which are all of the same "kind", but differ in stability: thought => dream => lucid dream => persistent realm => physical reality, with the last two being fairly indistinguishable except in terms of their content in context.

It seems that the difference is only in stability. Therefore we might ask, what is it that makes one stand of experience more stable than another? Is it just that relative intensity thing, the amplitude of facts?

Intending change in the "physical" strand -

How do you "think-intend" an object to move, rather than just think about it moving?

How does the dream intention differ from the physical intention?

There are two ways one does this in a dream: one directly "asserts the fact" of the movement, or one asserts an intermediary. It tends to be much easier to do the latter - for example, to "reach out" with one's feeling and grab it (avoiding here the more extravagant imaginings). However, since the whole dream is us, they are really equivalent, and I am just misdirecting myself from noticing I am actually still asserting directly - the "reach out" - because my assertion logically implies my result and makes it seem reasonable.

In both those cases, I am intending as the dream rather than creating a separate thought bubble, as it were. In waking life, the default would be to consider the body-space as "you" and the rest of experience as "other". Is the first step to identify with the whole experience, and so take it on as one's "extended body"?

The problem here is that there can be no "how" to do this, you just have to become it. But the intermediary approach in the dream scenario gives us a hint: expanding our "feeling-presence" to fill out the (apparent) room, and beyond.

The further we try to describe this, the vaguer and more abstract it becomes again, it seems.

Yes, this could be an issue needing both intensity and properly placed intention. Can we devise a test that can divide the two? A test where the level of intensity can be measured without worrying about the intent?

A first step might be to not try and alter any facts, but simply to recognise ourselves fully as the background of this strand of experience - fully assert that we are the "open aware perceptual space" in which experiences arise. This would be like a "null intention": no changing of facts but an establishing of context.

I do think an attempt at a "null intention" that is open and receptive is great for observation. But I think manipulation is what we are trying to achieve.

We might think of it as an initial "disentangling" of ourselves (or identification) from the content of experience, redefining our relationship to it into something clearer and cleaner, and in some ways allowing it to "settle" because we are no longer thrashing it.

So first we attempt to build a receptive, null state. When we get good at that, then we attempt to assert our intention upon part of what we receive?

Right. Now, we are always the entirety of the space and what arises within it, but having reshaped experience to be basically "I am the container + the content arises within me", the assertion would be more straightforward.

A further step would be to release the division between container and content and just identify with the entirety, but that shouldn't be necessary if one already recognises the truth of the situation. Also, if you do that you'll probably lose interest in changing anything!

So the general idea: first use assertion to reshape ourselves into an arrangement which promotes non-attachment to unfolding content, and then utilise that because this better allows subsequent assertions of fact.

so what am I doing wrong?

I suppose that would depend on what exactly you are doing! :-)

well everything always comes back to the same set of things so it seems like there is an inevitability of some sort but practically, now, i have a recurring ear blockage that seems to resolve with the associated thoughts so my desire is to resolve the ear blockage - by having the correct thoughts? nothing i do can resolve it - (as in the past) only having the correct mindset leads to the resolution, and the fact of its recurrence implies that there is something i am not grasping which leads to its reoccurring

For the sake of argument: if everything is part of a single landscape, then your ear and its condition is part of an extended pattern, and its blockage will be part of a larger structure. So the question becomes: how to get access this structure and allow it to shift? Which thoughts and/or physical elements are in play here, what is dominating?

Well, the nice thing about a continuous pattern is that there is no particular starting point as such. Rather than sloshing about looking for the thing which triggers it and work towards the problem, you could go to the "ear blockage" part of the pattern and work your way out.

How exactly would one do this? Well, just rest your attention lightly on the sensory aspect of the pattern (the feeling of your ear being blocked, located in your perceptual space) and sit with it, and mentally ask or intend to know what the extended pattern is of which the blockage is a part. I mean this literally.

Q: the answer I have is

sense of reality

what kind of things would the extended pattern be? if I have a general idea of metaphorically not hearing reality and it manifesting in my perceptual space as a blockage, I must have to arrive at the realisation of what is presently unrealised:

Which thoughts and/or physical elements are in play here

this goes deeper into the realm of controlling the environment and the perennial wish to teleport/change state. I have an idea of mushrooms facilitating that and finally mushrooms are growing. but again - what is the blockage...

having done this there is a slight alleviation but my other ear has been profoundly 'blocked' (deaf) for a long time

idealistically I'd like something like this whilst something like this occurs

There's not much point asking what things "are" - because the answer is: they "are" your experience of them, which is itself made from your awareness of it. You blockage might be said to be: the perceptual experience of having a blockage plus all its associations. If you "sit with it", with your attention on your ear and the sense of blockage or absence of sound there, you will likely after a while start having associations arise with it, as additional sensory experience or thoughts and impressions.

if all the associations with the blockages are to compel me to not remain in duality then the discomfort remains focusing on the problem leads to the recognition of the entirety of the duality the experience I want to have is the realisation that the control of the blockage is mine and then it will unblock so the only way to overcome it is to overcome it edit: and I can say with certainty that mushrooms enable me to relieve pressure, stiffness and blockages

You're overthinking this.

Q: If you "sit with it", with your attention on your ear and the sense of blockage or absence of sound there, you will likely after a while start having associations arise with it, as additional sensory experience or thoughts and impressions.

Yep - attending to, not thinking about or manipulation of. That's my practical advice. (Within the context of this discussion, that is.)

Q: if I wanted to have the experience of being in another place, I can get that experience but am limited to conventional travel. and as you said, And if this could be done, then the "open perceptual space" that you are might no longer be aligned with others' lists of facts, and you would cease to overlap with them. So, you would be experiencing flying around the clouds with your friends... while simultaneously they would be experiencing having a beer and a BBQ with you in the garden, firmly grounded.

this is the problem I have: what i 'see' has effect in mind but not reality. like the future-possibility is evident now but not for others unless I force it upon them, but to do that would require an actual changing of the world.

so if I want the experience of being somewhere else, I can get that experience, but only within the bounds of the current reality. and if I want to just have the experience without the necessary goings-to, I find myself lacking. like 'to do this I must do that' instead of just having the experience.

So, probably you should define what you mean by "reality" here? You seem to be separating out what is "in mind" and what is "in reality", somehow?

well... reality is like the result of my past actions and the difference between what i want and what already has happened. altering it is done by conscious or unconscious actions but it is always there. reality both impresses and is impressed by me...

Suggestion: Reality is an eternal landscape whose contours are adjusted by intention.

then where do thoughts come into it? they are possibly ways to contemplate adjusting reality but thinking is an intermediary step that is not necessary relating everything into experience, i can say for example, "i want to have mushroom" placed in the future but then experience it in the present (imagined possibility of a global mycelium network)

I'd suggest that context is the difference.

So, if I simply think "mushroom" (but non-verbally), then I am intensifying the unbounded extended pattern of "mushroom" and it will contribute more to my ongoing experience from that point onwards. If I narrow this with spatial, temporal, additional context, then that activation becomes more specific.

The landscape should be conceived of as "all possible fact-patterns as a distribution of relative intensities, hence at different levels of contribution to ongoing experience", which is "dissolved into the background" of the open aware perceptual space that you are.

Note that pre-existing patterns would be things like "spatial extent is a thing" and "temporal arrangement is a thing" and "time passing is a thing". Basically, if you can understand it, if you can think it at all, then it pre-exists and its level of contribution is adjustable.

Passing thoughts are just part of the current landscape. Intentional thoughts are deformations of that landscape; intensifications of that pattern. You are literally reshaping yourself-as-the-world when you deliberately think. . However, there is a further consideration: whether when thinking you are thinking in a separate "strand of thought" or in the same stand as the main 3D-immersive experience strand.

Meanwhile, emphasising: there is only The Now, even though certain experience may seem to be "about" the past, the future, the present.

...

Q: Well, there is no inherent structural reason why this couldn't be the case - the bunch of models or narratives we have are just our own fictions, they are descriptive rather than causal, they arise from a small subset of our observations-to-date, and do not really forbid anything. The only way you could know for sure is to adopt different beliefs and see how that affected the content of your subsequent experiences. Perform experiments. Having said that, it would seem like a good idea to have some sort of definition for what a "belief" is. Is it "thinking that something is true"? We are surely talking about something more than an opinion here. The literal formatting of one's mind by a "fact-pattern"? Could there be such a thing as "intensity" of belief or an "adopted fact"? How would one adjust the intensity of such a pattern, and explore its effects, if any?

The placebo effect is exactly our beliefs in action. Of course this is something different than 'everything depending on beliefs'. For a fact it is showing the causal powers of belief. Similar influence on our biological system have been shown during meditation. We now commonly accept these things as falling within the realm of neuroplasticity, in order to have a place for it within current paradigm. Despite this being a commonly accepted fact. We know jack-shit about it and there has been very little research into this direction. Mostly because there is no funding for it, not because of lack of interest. The research direction of psychokinesis (because that is basically what this is) falls outside current paradigms and is met with great hostility by self-proclaimed 'skeptics' and the ideology of 'scientism'.

Agreed on the placebo effect. That's one of the reasons why I think there's maybe a better word than "belief", though, since believing (in the sense of having a committed conscious view that something is the case) is not necessarily required for a placebo response. However, a certain sort of "patterning of mind" might be.

Again, when it comes to research we hit the problem that although "observations dictate the possible models; models do not dictate the possible observations", we behave as though to stray beyond the vague outline of our current concepts is indeed forbidden and non-scientific.

In recent times (probably post-WW2) our default view is that the world is now basically understood and is not mysterious to us - it's just a case of detailing it out. This, even though our models are completely lacking in explanatory power for most things, especially when it comes to the brain and consciousness. Vague 'placeholder' ideas or conceptual containers are not explanations, quite apart from being restrictions, but we behave as though they are, and that they define boundaries beyond which things are not "real". (Irony: declaring things to be unreal based on conclusions drawn from narrative fictions.)

Related post I enjoyed recently: Dirty Rant About the Human Brain Project [<https://mathbabe.org/2015/10/20/guest-post-dirty-rant-about-the-human-brain-project/>]

Could not agree more, please read The science delusion by Sheldrake. In it he outlines the philosophies leading up to our current paradigm and it is an interesting read. Chomsky has also said interesting things in this regard, read for example this [https://chomsky.info/201401__/]. The mechanical nature of the universe, you'll find, is a common theme. I'll pull out one quote:

It is commonly believed that Newton showed that the world is a machine, following mechanical principles, and that we can therefore dismiss “the ghost in the machine,” the mind, with appropriate ridicule. The facts are the opposite: Newton exorcised the machine, leaving the ghost intact. The mind-body problem in its scientific form did indeed vanish as unformulable, because one of its terms, body, does not exist in any intelligible form. Newton knew this very well, and so did his great contemporaries.

I think that whatever 'better word' you want for belief, we can still agree that it is part of the subjective and as such of consciousness. That, when we talk about belief, 'the ghost' is implied.

I think that I better understand what you mean by patterning of mind now. To me it sounds like what you want is the idealism that is currently being pushed by Bernardo Kastrup, for example here [<https://www.youtube.com/watch?v=iDW2V-fH6SY>].

Thanks for the Chomsky link - that's a new article for me, and a good quote, so will read. So, it seems we are coming from similar places.

I've read Bernardo's stuff and he's a good writer, but I'm not quite in alignment with it, perhaps because his metaphors stray towards trying to present things as objective-but-really-subjective, even though he himself doesn't entirely hold that view, it seems to be. I think some of that comes from a fear of advocating solipsism in any form, and also to keep things professionally presentable (both are fair enough). I suppose I'm proposing something that is a blend of philosophical idealism and non-dualism: staying pinned to direct experience, plus a baseline metaphor of "patterning" which allows conceptualising, but in the most flexible way, and in a way that could not be confused for being "how it is really".

POST: [THEORY] Many worlds/frames

I concur. At the end of the day though I think God made this very thing you described for us to enjoy. So do!

:edit: oops it looks like I got downvoted again for mentioning the word God. OH NOES!

God bless you viewer, whether you downvote or not, I hope your day is filled with peace and fulfillment. :)

While it's not very meaningful to talk about "God" without defining what we mean - some interpret it as an "entity god" others are more "the nature of existence" - I guess I can still pose this question: Is creation already done, in your view, and therefore we do not call upon God to achieve things, so much as use what has already been created, and that might include accidentally triggering "glitches"?

POST: Question, is anyone investigating this for real?

Well, people have pondered it as an idea, but the problem would be: is there a test you can perform that would conclusively prove that you are in a simulation? I'd suggest not. Therefore it is not science [<http://www.nature.com/news/scientific-method-defend-the-integrity-of-physics-1.16535>]; it is philosophy. And arguments like Nick Bostrum's [<https://simulation-argument.com/>], while fun, don't really amount to much.

Although, of course, it matters what exactly you mean by the term "a simulation". If you simply mean that objects do not fundamentally exist in the same format we perceive them (spatially-extended in space, unfolding in time), then that's an older philosophical idea, which is really just being dressed up in "we're in a computer" type terminology in an attempt to provide a modern twist on the question: "then what is the true form of things, beyond our experience of them?"

However, since we can never experience anything beyond our experience of them, we can never answer that question. All we can do is, observe that our experiences are consistent or not consistent with certain "connective fictions" we create about the world, and choose the ones that are most useful or elegant.

POST: Interesting report suggests reality only exists when we are looking at it

[POST]

I don't know if this has already been posted before as it was online in May, but I saw an interesting report stating that 'reality does not exist until it is measured'.
Thought it could explain a few things in this sub!
[http://www.sciencedaily.com/releases/2015/05/150527103110.htm]

[END OF POST]

Q1: More people getting the definition of "observe" wrong when discussing quantum physics, you see, in this context "observe" or "measure" simply means to interact with, the ground observes your foot as you walk on it, for example.

It's a philosophical point though, really. Practically speaking, the only way a system is confirmed as being in one state or another is when it is consciously observed - although not necessarily directly. Only then is one version or another of the "story of the system" confirmed (where in QM, the potential stories are the list of possible states that a particular situation can be in, with one of them being subsequently confirmed)

Q3:
when it is consciously observed
Nope. This is not quantum **physics**. There's a lot of other things that use the word "quantum" that might state something like this.. but quantum **physics** doesn't. Remember that when we "observe" something it means we are seeing something, i.e. an object reflects light and the light is captured by our eyes. This "kind" of "observing" doesn't really work when we're trying to "observe" subatomic particles moving at lightspeed..
"Observing" such particles means putting a detector such that the particle must interact with the detector.
No "consciousness" involved.

You're missing the point by... pointing it out:

"Observing" such particles means putting a detector such that the particle must interact with the detector.

I said that practically speaking, the way a system is confirmed to be in a state is by conscious observation. In fact, the detector is part of the system that is being measured. The recording of a detector is itself indeterminate until it is examined. If you had a camera pointing at the detector, then it would be indeterminate until someone looked at the camera monitor, and so on.

Note: this isn't saying anything magic about "consciousness". If we liked, we could call our eyes or our brains the "final detector". If this final stage doesn't happen, then nothing can be said about the actual state of the experiment, and it remains simply a description, a list of potential outcomes. (The delayed choice experiment is exactly about this issue.)

Putting the word "physics" in bold doesn't change this.

Q3: The recording of a detector is itself indeterminate until it is examined. If you had a camera pointing at the detector, then it would be indeterminate until someone looked at the camera monitor, and so on.
Well, quantum physics doesn't say that :)
nothing can be said about the actual state of the experiment
But then it's "unknown" rather than "indeterminate".. don't you agree?
Putting the word "physics" in bold doesn't change this.
It's not meant to change anything. Just explaining that the sentiment/conclusion is not based on science.

To be precise...

Quantum physics itself is a mathematical theory only which, given a well-defined context, provides a list of possible states and their relative "intensity" (I shy away from saying "probability" because that's already an interpretation, but you could use that). If you want to stick to "quantum physics" then you can say nothing more than this. Anything between that list and the observation is philosophy. This includes all of the common interpretations [http://www.preposterousuniverse.com/blog/2013/01/17/the-most-embarrassing-graph-in-modern-physics/], and any interpretation you might have of what constitutes a measurement falls into that category too.

Which is why I say "practically speaking", because in truth there is always an implicit interpretation taking place, and the line you draw between observed/observer is basically arbitrary. A detector that nobody ever looked at could not be said to define an outcome.

Some interpretations - especially, QBism [https://www.quantamagazine.org/20150604-quantum-bayesianism-qbism/] - do indeed take the view that the subjective observer is the one who defines the state from a set of possible outcomes. If we were to follow that interpretation, then a statement saying that the measurement == the conscious observation would be correct.

But then it's "unknown" rather than "indeterminate".. don't you agree?

Well, no. Indeterminate means "not exactly known, established, or defined". It is the more accurate term here, because the set of potential outcomes is known, however the system is not precisely defined. ("Indeterminacy" is in fact the commonly used term [https://www.informationphilosopher.com/solutions/experiments/schrodingerscat/].)

It's not meant to change anything. Just explaining that the sentiment/conclusion is not based on science.

It is, insofar as any of the interpretations of quantum physics are. However, I would agree that these really fall into the realm of philosophy, since one cannot distinguish between them via experiment - and this includes "collapsing wavefunctions" and all the other common representations of the measurement process. (Luckily that means "many-worlds" also gets put into the same bucket.)

EDIT: Hope that doesn't read as being too "direct" - just thought it helpful to clarify where I'm coming from here!

Q4: That's a very interesting article (on QBism) - thank you for linking it. First time I've read about it, but it really syncs up well with some of the thoughts I've been having lately regarding modern culture and what we've done with/to ourselves by locking ourselves into an incredibly unimaginative, scientifically-oriented state of being:
It's said that in earlier civilizations, people didn't quite know how to distinguish between objective and subjective. But once the idea of separating the two gained a toehold, we were told that we have to do this, and that science is about the objective. And now that it's done, it's hard to turn back. I think the biggest fear people have of QBism is precisely this: that it's anthropocentric. The feeling is, we got over that with Copernicus, and this has got to be a step backwards. But I think if we really want a universe that's rife with possibility with no ultimate limits on it, this is exactly where you've got to go.
I wonder if we could ever successfully disentangle (no pun intended) ourselves from the current mass mindset that predominates our interpretation of the universe without the "aid" of some kind of apocalyptic-scale disaster, though.
There are some aspects of QBism that I'm not sure I can wrap my brain around - namely that if each of us is carrying our own version of the collapsing wave function around, how do differences resolve themselves (perhaps this is responsible for "glitches")? At any rate, I'm going to save the info on there for later perusal. I'm particularly interested in going through Fuchs' more comprehensive writings.

It's not so much that being scientifically-orientated is a problem, it's that we are binding ourselves to a certain set of models as being "true" (which is not really the intention of science). There are hidden assumptions in our approach to thinking about experiencing, which this hard-line belief (rather than relative use) prevents us examining. (Specifically for me: the notion that the world is "happening" in the same manner and format that our observations "happen", and that therefore so-formatted descriptions are "what is really occurring" between those observations.)

Recent articles by the likes of George Ellis have highlighted this trend, which is basically towards a sort of "scienciness" (compare with: truthiness [<https://en.wikipedia.org/wiki/Truthiness>]), which I think flag-wavers of science, meaning the readers of enthusiastic popular science magazines plus undergraduates, tend to embrace and assume as an identity more than actual scientists do. (I linked to the Mermin article critiquing the "reification of abstractions" before.)

I'm pretty hopeful that a new set of metaphors (which is what scientific and philosophical descriptions really are, although we are sometimes inclined to forget it) can take hold which will give us new insights for prediction, but also applicable to "flexible living". I've certainly had quite a lot of discussion in that direction, anyway.

In terms of "how to differences resolve themselves", the answer is - they don't need to. There may be a preference to imagine that our individual worlds overlap (see the Nature article by Mermin on QBism), but it is not a necessity - not in the sense of sharing a "spatially-extended place unfolding in time".

Strictly speaking, you are not carrying your own copy of the world, rather you (whatever "you" truly are) has taken on the shape of a particular version of the world, and is having an experience you might call being-a-world-from-the-perspective-of-a-person. This is where philosophical idealism or non-dualism, and physics, might overlap.

Anyway, it's all fascinating to do a bit of freestyle thinking about, and it opens the possibility of connecting these descriptions to direct experience in a way we haven't been able to before.

Aside - The full Fuchs writings are pretty fascinating, but also a sizeable slog. Definitely worth a browse though.

What's so special about the human mind that makes it the only thing capable of brining things into existence?

Who's suggesting that?

Although... I suppose strictly speaking it's meaningless to talk of anything as existing beyond your mind, since both your experiences and your descriptions of it are within the mind. Everything in the form that you experience it, is brought into existence by your mind. The idea that there's a world beyond it which is formatted in the same way as your experience - even in terms of it being arranged in space - is nonscientific, since it cannot be tested. After all, "objective reality" is a conceptual container really, rather than an actual thing. But all that, it's philosophy really.

All science can do is examine what can be observed, and what can be conceived, and what can be communicated - within and by the subjective human mind.

...

Q2: Which is really the only thing that makes sense. The idea that something exists without something else causing it to exist is kind of silly.

Really? How can one thing cause another thing to exist?

Q2: Magnetism is a manifestation of the magnetic field, for example. Magnetism only exists when a field causes it to exist. But, in a similar vein, just about every aspect of human society exists because someone had an idea, then put those ideas to action, causing the thing to be made. Television, cell phones, planes, trains, automobiles, books, and not just physical things, but abstract concepts as well, such as the number five, the spoken word, or the concept of "meaning." Those ideas were caused to exist by other processes (perhaps of metaphysical origin, or perhaps of biological origin). Those processes themselves were caused to come into being by everything that has allowed humans to exist, everything that has allowed the earth to exist, and even everything that has caused Time and Space themselves to come into being. Everything has an origin point (albeit, not necessarily identifiable to us). Even if you go up and up the chain, until you get to the Total Set (The set of all Things, Events, and Manifestations (that which takes place outside of space or time, but is still an equally real portion of existence)), everything has a genesis. The Total Set, on the other hand, seems to have manifested itself. I'm not sure I understand your question, but I hope I answered it. If not, please clarify, and I'll give it another go. :)

The Total Set, on the other hand, seems to have manifested itself.

Right. I guess the issue is with the word "exist", and we probably have to take care to make a distinction between "creation" and "cause" (since creation has already happened, not intending to sound Biblical here). "Bringing into existence" tends to imply "creation".

This means that it's probably better not to say that something causes another thing to exist, because everything is on the same level. Does one thought cause the next thought? If there are two folds in a blanket, and I pull on one fold and the other is moved also, did fold-1 cause the movement of fold-2, or is it just part of a larger movement?

It's a matter of perspective, of the "radius of observation". In a sense, looking out the window apparently causes the landscape to exist for you; boiling the kettle apparently causes hot water to exist for you. In both cases, something like "brings into sensory experience" is probably a more accurate phrase?

EDIT: There's also the additional point in cases such as magnetism: in what sense does a magnetic field "exist"? It's really a concept, an abstraction we used to describe and calculate the "what if?" scenario of a certain arrangement of materials.

Q2: Right. From the highest perspective (the Total Set) No independent subset caused any other independent subset, the Total Set manifests itself (and is therefore responsible for everything else). I don't believe that the mere observation of a thing causes it to spontaneously pop into existence - I believe everything has always existed. Like you say, when something enters our radius of observation (I prefer "point of reference," or "Sphere of influence", myself), it can impact us personally. I have observed that we, as a society, tend to take the nature of reality very personally. That is, we do not value all of our experiences equally. If we did, there wouldn't be so many people on this subreddit posting things like "I know it's impossible, but...". Impossible things can't be experienced, but we tend to place great value on the experiences we understand, and shy away from believing those experiences which we do not. (Though, I will say, that those who frequent this subreddit are among the most open-minded individuals I've encountered in all my human experience, and greatly enjoy the generally pleasant community here). Someone who values An Understanding of Reality over a True Understanding of Reality, will only ever have the former, and can never have the latter. As long as someone believes that something is impossible, for them, at least, they will always be right.

We seem to be in agreement.

There's definitely a problem which has become worse over the last decade or so, and that's the tendency to confuse abstractions with actualities, and models with hard limits. The true situation is:

- Observations dictate the possible models.
- Models do not dictate the possible observations.

However, everyday folk and ironically science geeks (rather than actual scientists), have adopted the approach that conceptual frameworks are more "real" than their own direct experiences, and that if something doesn't fit in with their general model, then it can't be "true". What's irritating is, it only takes a little bit of experimentation to demonstrate this is in error - because if one adopts an alternative theory, one quickly encounters evidence to support it, even evidence directly contrary to the theory you held the previous week.

Q2:

Observations dictate the possible models.

Models do not dictate the possible observations.

I love this! I suppose all we can do is to continue to be the voice of open-minded reason, celebrate when we and others make new discoveries, and respect when others refuse to make their own.

That is a fine manifesto, I would say.

...

An infinite, looping set of systems. The biggest question I can see there being, is how did it begin? But that's only relevant if you're a three dimensional being like ourselves. The big bang theory falls flat on its ass if you think of time as the dimension that it is, rather than something that had to move along in a line. We never ask, how did the first or second or third dimensions come to be? It's all a weird inherent self causation. You are caused by everything else, but you also cause those things, and in turn, yourself.

I think you pretty much have to go with a static configuration space - an eternal landscape - to make sense of it. (Julian Barbour, etc.)

TriumphantGeorge Compendium - Part 25

POST: Schrödinger's Cat

[POST]

This post isn't a story but a theory of quantum mechanics that I thought might intrigue readers of this forum.
"Schrödinger's cat: a cat, a flask of poison, and a radioactive source are placed in a sealed box. If an internal monitor detects radioactivity (i.e., a single atom decaying), the flask is shattered, releasing the poison that kills the cat. The Copenhagen interpretation of quantum mechanics implies that after a while, the cat is simultaneously alive and dead. Yet, when one looks in the box, one sees the cat either alive or dead, not both alive and dead. This poses the question of when exactly quantum superposition ends and reality collapses into one possibility or the other."

[END OF POST]

Should really have a [META] or [THEORY] tag at the front of the title.

My favoured approach:

Quantum mechanics, being a mathematical theory, says nothing about what states are or what happens prior to or at the point of observation. Interpreting them as "real" is a philosophical choice, but it says nothing scientifically about what actually happens, since it cannot be observed (because that would be the point of observation). None of the objective interpretations of QM can say anything about this, because no test could ever distinguish between them.

The more honest approach is to take it for what it is: given a specific situation, quantum mechanics provides you with a list of possible outcomes, one of which you will observe. Those possible outcomes are not "real", they simply constitute the narrowest list you can generate based on the information available to you. Superpositions and states are abstractions and so they never end, and nothing collapses into possibilities, because they don't exist in the first place. (See QBism for a theory based on this approach.)

When you go to the grocery store, does your shopping list of potential purchases "collapse" into a specific basket full of groceries?

The truth is that we have tended to make the assumption that when we are not measuring things, the universe still "happens" in the same format that our observations "happen". Experiments such as the double slit and delayed choice experiments suggests that this is an assumption too far - and that the only thing that ever "happens" is observations, and nothing is "going on" between them.

POST: Serious question: Why do the stupidest most mundane posts get upvoted on this sub but actual glitches such as Dejavu or Double Slit experiments get downvoted?

A couple of thoughts:

- Deja Vu reports which say "hey I thought I'd seen it before" without more detail, aren't glitches.
- Double slit experiments aren't glitches, and they're not typically personally experienced.
- What's mundane to you, isn't necessarily mundane to someone who had the "personal, everyday-mode experience for which you have no explanation."

Deja Vu reports are not "hey I thought I seen that before". We still do not fully understand them and in fact in some cases they believe it to be psychological while in others they think it is more physiological and could be triggered by epilepsy. But in reality we still do not know. And BTW I am not at all suggesting Deja Vu is a glitch, I am simply suggesting that this phenomenon to me getting downvoted while someone losing their cheese sandwich getting upvoted is crazy but then again this is Reddit.
Regarding the double slit, I am not going to get into because without being rude I really think you might not be understanding it fully and in relation to what we understand about reality as it is with physics and quantum physics but also the study and understanding of consciousness.
Regarding the mundane, what you have said is simply describing anecdotal evidence.
I suggest you do some further reading, happy to recommend a few things for you. Just PM me.

I agree we don't know about deja vu - most of the theories are handwaving and unpersuasive (brain memory echoes and so on). I think many of the deja vu reports tend to get down voted because they don't contain any new information - and there are a lot of them. (Most of the reports are "I had this feeling I'd seen it before". This is different from any explanation, note.)

Do tell me what I don't understand about quantum physics and the double slit experiment! ;-) Tell me in what way it counts as a glitch, briefly.

Of course glitch reports are anecdotal - that's the point, surely, by the very definition? They are personal events which led the experimenter to doubt their ideas about how reality works. What the nature of that experience is, that's the next step.

EDIT:

I'm an ex-physicist. For sure, quantum physics and the slits experiment certainly reveals a lot about our assumptions regarding our own abstractions, and the delayed choice experiment reveals even more about this - that our assumption that things "happen" between observations in the same form as we experience them is basically incorrect. It's thought-provoking for sure. And I think QBism [\[https://www.quantamagazine.org/quantum-bayesianism-explained-by-its-founder-20150604/\]](https://www.quantamagazine.org/quantum-bayesianism-explained-by-its-founder-20150604/) is quite a nice attempt at producing a "single-user theory" that avoids all those crap many-worlds type interpretations.

But, there's no way to scientifically study the meaning behind the maths of quantum physics - and it is a mathematical theory. It's only ever going to be philosophy or metaphysics. So as regards glitches... the double slits is merely a fact, which reveals that we don't have a coherent narrative for those situations. It's on the list of "things to make better explanations for"... and there's not much new to say about it. It doesn't really provide any help for glitch experiences, other than emphasising the old philosophical problem, that we cannot tell what the form of the world is beyond the formatting of our sensory experience - assuming there is a beyond - and it remains an "infinite gloop" which cannot be interrogated.

Look i'm not a scientist and I can only explain this idea from a basic level. Here goes.
Matrix Glitch reports being anecdotal means they cannot be matrix glitches.
Firstly we are discussing a topic that is fringe, so you have to leave that governing part of your brain at home if you want to step on this ride.
Most people in this sub are discussing paranormal phenomena, psychic experiences, psychological issues, memory loss, hallucinations etc. By their definition they cannot be glitches. Because;
The term glitch is clearly defined and as we all know was popularized in the Matrix films which I personally think did a pretty good job of explaining not only the matrix but the way glitches might work, only it's still Hollywood at the end of the day so they take these pretty big concepts and break them down into bite sized chunks the public can understand and when you do that you lose some of the essence and quality of the idea.
A Glitch is a part of the matrix in that it is a flaw of the matrix. These other things people are posting relate to their experience within the matrix, because of the very rules of the matrix. They are not flaws, they might be perceived that way because of many various reasons, subjectivity, feelings, emotions whatever. They may even seem chaotic but they are not glitches.

So, with that said I believe the double slit phenomenon truly is a glitch in our reality.

Being a physicist you understand our quantum world does not behave like our regular world. So in a way you could say these are two different sets of programs. We understand one really well and we are beginning to barely scratch the surface of the other.

Then you have consciousness which science does not understand - now here is the funny thing. What we know about consciousness and what we experience tells us we can be aware of both of these programs at the same time and I personally think this is where the glitch is.

So essentially we have light acting as a wave and as a single particle but observe it and it switches, no rhyme, no reason. The very act of observing this process forces it to switch. Like a rule. It behaves how its told to behave.

So what is telling it to behave this way?

The glitch is. But not by intention. It'd non-intended.

And if you don't care to entertain this idea, i'll gladly give you my email and you can email me in 30 years and I guarantee you, they will be no closer to figuring it out because there is nothing to figure out. It is a glitch.

Back to our matrix theory.

If we can all agree that our reality is programmed and there is now actually a little bit of science behind this [<https://www.youtube.com/watch?v=bp4NkItgf0E> & <https://www.youtube.com/watch?v=b6w0K5FigsUJ>]

So if we can agree that our reality might be a giant piece of code (I believe it is) than can we also agree that code can contain errors even on the grandest of scales? I think it can and I actually believe the glitch reveals an unintended insight which is beautiful in a sense just like the imperfections in a rose bush or an animals colours or a fancy piece of wooden furniture.

And the glitch is not what you think it is. It's got to do with consciousness and not the behaviour of the particles but the problem is we don't even fully understand the way the particles operate.

The problem with our understanding in this experiment is its being looked at by scientists in a non computer model way. But if you look at it like a computer program model you can see clearly, blatantly it is a glitch.

This glitch is forcing us to think about our consciousness and how it behaves and effects other things is it not? Look at the effect it is having and reflect on it.

My 2 cents and to make it fun, i'll bet a bottle of fine liquor on it that unless they begin looking at this problem like a computer program they wont figure it out ever.

:)

Ha, fun.

[Aside - The subreddit specifically avoids "glitch=simulation", it sticks to the idea of the experiential event which makes you question things, and does not presume the explanation. Just thought I'd get that out of the way first.]

So, there is a problem with the simulation/program metaphor. I suggest that it takes an old philosophical idea, and then sprinkles inappropriate computer metaphors on top.

Let's play with this...

The philosophical idea is that the universe is not of the same form as our experiences. Specifically, that space and the passage of time are part of experiences, the formatting of our senses, rather than the formatting of the universe itself. The universe itself, in fact, just cannot be described, because it is "before" division and "before" change. We might refer to it as an "infinite gloop". What we actually experience, then, is the patterning of our own minds. And what are minds made of? Consciousness.

The universe is therefore a particular distribution of patterns (or "facts") at different levels of contribution; a landscape across which our attentional focus apparently shifts. There is no substrate to this patterning, no underlying solidity. There is no "hardware" to this "software". Furthermore, the landscape is static, so there is no sense in which the "software" is "run"; there is no processing. Or rather, the only processing is consciousness taking on the shape of different patterns, which happens "before" the experience of time.

So, that's like a blend of George Berkeley, Immanuel Kant, non-dualism, and some other stuff: philosophical idealism.

What about quantum mechanics then?

Well, what experiments with quantum mechanics reveal to us, is that we hit a limit as to what can be conceptualised. We are stuck, in thought, with imagining in terms of "parts" and their relationship in space, unfolding in time. However, the world is not a "spatially-extended place unfolding in time", it is a superposition of patterns basically "dissolved" into subjective consciousness. This doesn't matter usually, and we imagine that when we're not looking, the world is still "happening" behind the scenes - but that is not the case. In fact:

- The only thing that ever "happens", is observations.
- All descriptions we create to explain observations are connective fictions and never actually happen.
- At small scales we are forced to confront the statically patterned nature of the world.

Speaking very broadly here, just to get the general point across. But you maybe get the idea.

And glitches?

Glitches correspond to a shift of the "world-pattern" of a particular conscious perspective, where the "world-pattern" is defined as the particular distribution of patterns contributing to the ongoing experience; the static landscape that corresponds to the current state of the world within a subjective conscious viewpoint. Which is why I'd separate out QM and glitches:

- The double slit observation is an artefact of the "granularity" of a space and time based landscape or "world-pattern".
- A glitch is a shift in that world-pattern which leaves only a memory within the subjective consciousness, with no observable trace in the world-pattern itself.

TL;DR: Stuff about philosophy, consciousness, patterns, granularity and shifts!

Responses & Reasons

How can a glitch be a shift in patterns when the pattern is intended to shift and there are trillions of simulations and options that you are not aware of?

That's called "begging the question", I'd say! :-)

Have you ever had an experience other than your own? Have you ever seen "other simulations"? You have only ever experienced the content of your own subjective viewpoint. To understand the nature of experiencing, and from there understand the content of experience, you need to refocus on the subjective, in my view.

And the very fabric of this Universe, the canvas and the rules that govern it is in fact the Matrix.

You don't need that extra metaphorical layer for your explanation, though. In fact, it makes "the Matrix" kind of meaningless - it's equivalent to saying "stuff is made from stuff" and still leaves the area of consciousness unanswerable.

But it exists, how else do you think you are able to walk in the 3rd dimension . . . it is because of the rules.

This flips things around incorrectly, I think. In fact it flips science around badly too. "The rules" don't cause anything, just as "the laws of physics" don't cause anything. What you are talking about is "regularities in experience", from which you might make up a connective fiction about "rules" - but there's no need to. If experience is inherently patterned, then the natural state is not chaos, the natural state is the formation of habits. I've seen those videos before. They amount to seeing patterns in experience. It's a nice demonstration, but it's not the demonstration of what he thinks it is. The universe is not a computer system. Our experiences are patterned certainly, and that pattern is you, I suggest. Which is in effect what Quantum Bayesianism takes as an approach.

QBism & The Now

Here's the more accessible article on QBism (the first one), plus an article that may or may not be useful to you about reification of abstractions by the same author:

- Physics: QBism puts the scientist back into science, N David Mermin [<http://www.nature.com/news/physics-qbism-puts-the-scientist-back-into-science-1.14912>]
- What's bad about this habit, N David Mermin [<http://www.ehu.eus/aitor/irakas/mes/Reference/mermin.pdf>]

It's quite a good read, the QBism one, especially on the subject of The Now, although you'll notice he chickens out at one point. Specifically here

"When you and I are communicating face-to-face I cannot imagine that a live encounter for me could be only a memory for you, or vice versa."

I can imagine this, and in fact it's the only reasonable account of how subjective perspectives interact: they don't, as such.

Consolidation & Content

Cutting to it, why am I being so dismissive of the "simulation hypothesis"? Because it's yet another metaphorical abstraction. It's completely fine as that, but it should not be confused with "how things really are", which is much simpler: patterns in the mind. Simulations, objective universes, the material world, all those things are inventions to try and counter the fact that there is no outside to experience, and all potential experiences are dissolved within it, essentially. For example, the room next door is not "over there". These all old ideas, of course, with Zen buddhism, philosophical idealism, having covered the same ground repeatedly. The metaphor I find useful is this one:

- The Imagination Room

It's a neat way of realising that you are an "open aware conscious space" which takes on the shape of experiences, including the experience of having a 3D viewpoint, of being-a-person-in-a-world. It is the patterning of that experiencing space, rather than an inherent structure in an extended externally-defined universe, that is responsible for the regularities you see around you. Basically: you are living as your own theory at all times. Why do you think all these different theories are promoted by people with such dedication? Why are they so convinced they are right? It's worth pondering. For you, that theory is "we're in a simulation". For me, it's "I am an open space of awareness". For some people, it's "god is talking to me personally and I'm being chased by government spies". The fun thing is, you can very quickly change your patterning so that another theory seems to be true. By this time next month, I could have you convinced that owls are running the universe! ;-)

Aside - Actually, you might find Kirby Suprise's book on Synchronicity interesting on this front. I don't totally agree with his model (but he is upfront in saying it's just a descriptive fiction, so that's okay), but as a clinical psychologist who has experimented with people's tendency to literally experience their own theories as true, it's worth a read. Most of his points are described in this radio interview, if you're interested.

Thanks for the interesting conversation, by the way - TG

POST: I Got My Cat Back, But at What Cost?

It does not seem to work like that. More than likely, you died, and your consciousness shifted to a nearby reality where you did not die, much as Alvin did not die. You might note quite a bit of minor discrepancies. Certainly. no-one around you is going to remember you mourning for Alvin since Alvin never died. The reality shift may not have happened as a result of you dying, either. Pocket realities are in the process of being lined up and merging in order for them to stabilize. This is a merged reality, rather than an entirely different one.

This seems awfully complicated...

How exactly do we know that there are various realities, and that they are merging and so on, when we can't get "outside" of them to see this happen? Isn't that just the unfalsifiable many-worlds hypothesis all over again?

Assuming people's stories are correct, all we know is that their ongoing experience of the world suddenly shifted vs their memory of it. Everything beyond that is just imagination and conjecture, right?

I disagree, but a great many of my five-dimensional selves have integrated across numerous collapses of formerly possible pasts and various iterations of timestreams. Those are my cumulative experiences. For me, it is not conjecture; it is understanding. How do I know that various realities are merging? I am experiencing them, and I have dealt with enough reality shifts to have a great idea about not only what is going on but why it is going on. How would you know? You would only know if some of your experiences with such shifts and collapses were somewhat similar in nature and volume to mine (more or less). Without that kind of direct experience, it certainly looks like imagination or conjecture. I am certainly no evangelist. There is no need for you to accept or reject the explanation. It is there for what it is worth. The space-time continuum is healing/being fixed. It is a simple truth which sheds a whole lot of light on many Glitches in the Matrix along with Mandela Effects.

What I am - well, not disputing exactly, but exploring - is your interpretation of experiences. "Timestreams", "realities", even "space-time continuums" and suchlike are abstract concepts which are not experienced as such. What is experienced is something not being as you expect it: a situation not being how you remember, or, occasionally, witnessing a change. Everything after that is, surely, philosophy and metaphysics? Nothing wrong with that; but such things are conceptual frameworks which are not true; they are useful.

The very idea that a "space-time continuum" is "healing/being fixed" seems to me to be an interpretation from nowhere. It might "explain" but only in the sense of being a description; it's is not a truth. I've never seen a space-time continuum, but assuming there is such a thing, I don't see why it would need healed for or by anyone.

Do you see where I'm coming from?

Broadly, I'd suggest: the only thing that is true is our direct observation. Everything beyond that is a connective fiction, a narrative. The further we move from being able to tie our narrative to an observation, the more we drift into ungrounded interpretation - as in, one of many interpretations, selected on preference rather than accuracy.

Because we simply don't know what is true, it may be best to keep all ideas on the table until they can be proven incorrect.

That's actually what I was getting at.

Basically, given the actual observed content of experiencing such a "shift", there are always multiple ways of describing it - several different conceptual frameworks we could use to construct an interpretation. We build a description from ideas, but any ideas which can never actually be experienced, are just that: mental constructs.

It's perhaps similar to the situation we have with the common interpretations of quantum mechanics [<https://www.preposterousuniverse.com/blog/2013/01/17/the-most-embarrassing-graph-in-modern-physics/>]: there's nothing really to choose between them except individual preference - because they all predict the same observations. "Many-worlds", for instance, is really just a fanciful imagining of what lies behind a mathematical theory, a theory which only makes a prediction of an outcome, and doesn't actually say what happens to produce that outcome.

So - when we talk of "time-streams" and "merging realities" of multiple worlds, we're engaging in philosophy. We might equally formulate a description in terms of the instability of patterns in extended minds, and have it match the observations identically. There'd be nothing to choose between the two, except personal preference. So I was curious about /u/alanwescoat's certainty in his description. Was it simply that it's easier to speak as if your current favourite framework is how it really is (I do exactly the same thing; it makes discussion simpler), or does he actually think that is what is definitely happening? And if so, what's led him to choose that particular interpretation over another?

Good questions TG. I too am curious about his thoughts, observations and interpretation. Thanks for taking the time to read my very long post! Hopefully I didn't come off as one-sided since I actually think you both have bits of truth here.

It was interesting and well thought-out; thanks for writing. And this topic gets right to the heart of the whole glitches thing, I think. As for "truth", I generally split it into two categories at the moment:

- There's Conceptual Truth, which is having a description which is self-consistent and matches the observations. This doesn't mean it was "what is really happening", but it provides a way to connect different experiences together and think about them.
- There's Direct Truth, which is the actual sensory content of an observation, before it's been abstracted. (Note, a thought is itself also a direct experience, but only of a thought, as a "shadow-sensory" observation, not of something outside of that which it is "about".)

The hardness of the floor under your feet is directly true, for instance. Meanwhile, you might develop a theory about "hardness" based on your observations. There are probably thousands of ways you could put together that theory - so none of them would be "the" truth, they would just be relatively true within themselves. Only the direct experience of the floor would be fundamentally true.

So for glitches: the actual weird experience = direct truth. The description or interpretation of that experience = conceptual truth.

There's some overlap of course, because your experiences are to some extent "patterned" by concepts which arise with it, but it's quite a useful division for checking what percentage of your worldview is imagined fantasy.

Let's see if our reality-blending friend has any thoughts on the matter...

...

Many-worlds and friends is definitely a nice "thinking framework" and - although it is not scientific in my opinion (I'm full of opinions aren't I?) - I think it can help people a lot, because it's a way of having people realise an important philosophical point: that the form of the universe (whatever that is) is not necessarily of the same as the form of your everyday perception.

In other words, 3D-space and time are part of your experience, they are not the format of how things are "happening" when you aren't experiencing them. The world is maybe more like a dimensionless gloop of facts which can be called up. The room next door is not actually "over there"; it is actually sort of "dissolved" into the background right here and now.

Once you've got a feel for that concept, and have recognised the hidden assumption you have been making, then your perspective on an awful lot of things can change quite dramatically.

POST: [THEORY] Everything that is true and can't be accounted for in this sub, explained

Some thoughts...

So if the fabric of reality is information

But, what is information made from? And what are our five senses made from? What are "we", in fact?

Does the simulation need to actually exist at all - as a thing that is "run" or calculated or rendered? Or can it just be, say, a static informational landscape of higher dimension - or even an "infinite gloop" containing all possible experiential moments - which we traverse with our attention?

I suppose the short version of what you are saying is: there are no fundamental rules. I would suggest that even in the standard view there aren't any fundamental rules either. Rather, we observe certain regularities in our subjective experiences, confer with others to see if they are shared, and then summarise those observations as "rules". That's science in action. We might call these rules "laws", but they are laws in the sense of being a concise and broadly-applicable description; they are not "who the world works". Thinking that is so, is where sometimes we have gone wrong. What information theory and its like free is from, then, is the incorrect notion that our inferred concepts are what is actually behind the universe - somehow separate from us and dictating our world - rather than just connective fictions we've made up based on the things we've seen. We have tended to elevate our abstract ideas above the content of our direct experience, and subordinate ourselves to them instead of only making use of it. The potential problem with the information perspective is perhaps that it doesn't go far enough: it might dissolve the idea of definite external rules, but it still asserts that there is a define external structure which provides a substrate for our experiences, even though we will never actually experience this final abstraction.

With thanks to N David Mermin.

Information is defined as a difference that makes a difference. An on/off switch, binary is the most basic way to express something. There is either 0 or 1.

For sure, but what is that 0 or 1 "made from"? What is the construction of the "switches"?

Or is it completely dimensionlessly abstracted and inaccessible? Which is fine: it harks back to Kant and his transcendental idealism and other philosophies which propose that space (extent) and time (change) are part of experiences rather than fundamental to the universe (which itself becomes simply a concept). It's something to be clear about though.

As intangible as it is, they are all ramifications of infinity. One divine paradox, resulting in no such thing as nothing and only gradation between the everything; no two things allowed to be the same. 0 and 1 are simply the simplest or smallest memes to describe the gradation. Chain-asking "but what is ____ made of?" Inevitably lands on "infinity," which can only be answered by "a paradox. The first and only paradox." It caused itself. It's f'ed up!

Well, the simpler way might be to simply state that there are patterns or forms, but there is no substrate. Since we have dispensed with space and time, other than as modes of experiences, we could say that they are made from "existence".

Meanwhile, 1 and 0 are statements of relativity, existence and non-existence - and infinity would really just be a word for "non-distinction".

From my limited understanding, when you play the "what is ___ made of" game, you get to the point where you are looking at energy and potential. Which is why this tread is blowing my mind, because at the bottom of it all it seems like everything we interact with is just information not particularly ment for us to see.

And "energy"and "potential" are both self-referential concepts. Energy is a measurement rather than a "thing"; it's a bookkeeping quantity without a quality. So pretty much it's the equivalent of saying that "length" is the fundamental property of the universe. Not the length of anything - just "length".

Which is the same as saying "amount", but not an amount of anything in particular. Which I suppose again leads us back to saying that the fundamental quality of the universe is "existence".

POST: Remembering Memories From Other Timelines?

[POST]

I remember waking up one day and not being able to move my legs. I also remember drowning in the pool of my aunt's apartments. No one else involved in these memories remembers them.

1: My dad was trying to wake me up. I was about 8 or so, and told him I couldn't leave the bed because my legs wouldn't move. I tried to move them, but it was like there was a block in between my head and my legs. They wouldn't move. He scooped me up and put me in his truck. We went to a hospital. I'm pretty sure it was Baylor Medical Center in Garland, TX. I recognize the building's unique porch-roof-thing?

Anyway, we were admitted. And I was given a wheelchair to sit in. I remember that in particular because I was having fun figuring out how to turn it by using one wheel and not the other.

Eventually I had x-rays taken of my legs. I remember this very clearly because it was terrifying. The nurse was very kind and my mom was there, but the machinery was very scary. I was cautioned not to move, but since I couldn't move anyway-- That was redundant.

We left the hospital. I spent the rest of the weekend with my dad, and when it was the school week they left me with my grandma. I spent a couple days with her, and then

the memory ends.
I'm mentioned this to my mom and my grandma (I no longer speak to my dad and couldn't get in touch with him even if I tried) and neither of them remember this. My mom remembers taking me to the hospital for "something about [my] legs" but can't pin down what happened. It was 17 years ago, though.
2: When I was 12, I was at my aunt's apartment to use her complex's pool (ours didn't have one). My aunt, my mom, and I were all in the pool and we had it to ourselves that day. The pool was made of two rectangles forming a 90 degree angle. One of the rectangles of the pool was slightly smaller than the other. My aunt and mom were in the larger area, talking while floating on those inflatable lounge things. I remember bobbing my head out of the water, trying to get their attention. There was something bothering me, and I was scared but I don't remember what it was. I can't breath enough to yell at them. I mean, looking back I can infer that I was probably drowning. That memory just ends in sort of purple. But, neither my mom nor my aunt remember "that time i nearly drowned."
Theories: I have false memories. I'm remembering things wrong. Or, these things happened to some other version of me, and I have her memories too.

[END OF POST]

Q1: This seems like more of a Mandela Effect sort of thing than a glitch, but it's interesting nonetheless. I'm of the mind that these sorts of memories are the result of the phenomena described by the "quantum immortality" theory. It goes like this: we don't actually experience death. When something happens that kills us, our consciousness shifts into a parallel universe where that thing that killed you didn't happen. This new universe is almost exactly like the other one, it's just that in this one you didn't die. So using this theory in your case, it would mean that when you were 12 years old you drowned, and died, in your Aunt's pool, but then shifted to the universe you're in now, where this incident never happened, and thus you lived to see another day.
The implication with this theory, though, is that when you shift into the "new" universe where you survive your death, there will be other little things that are different from your "original" universe. Basically, this is because there are no two universes that are exactly the same. In order to "find" a universe where you are still alive, you're consciousness takes the one with a timeline that is most similar to the original. This could explain the other memory inconsistencies of yours. Perhaps in this new universe, where you never drowned and died, there never was an event with your legs; not because this killed you, too, but because that event just isn't included in the timeline where you aren't killed in the swimming pool.

Q2: The theory doesn't allow for the millions of seconds that a lfe can produce these extra forward moving life times (times as in multiplying) the billions of people currently in the world. How can a person create a different life time in a different dimension if that persons lifetime is connected to everyone elses lifetimes. How do we account for that?

Possible answer: We are each of us completely alone in our own private copy of the world.

That's kind of terrifying...

Okay, updated answer: We are each of us an "open consciousness space" which is having an experience of being-a-world-from-a-person-perspective.

Any better?

Not really...

Why not?

Admittedly, it means you aren't a person; you're just having a "person experience". But it also means you are completely at one with the world because it's all "inside you". Surely you can't be lonely if there is no separation? Isn't that better than being "made from atoms", for instance?

It'd mean that all I've ever experienced and everything around me is something only I know, and that no-one else than me is a person the same way as me.
On the other hand I have no problem being made of atoms, yes I'm probably just a lump of conscious atoms, but what's the problem in that? So is everyone else.
I'd much rather have that I'm sharing the world with other people, and that the world is just as much for them as it is for me, than the world being just for me, and only something that I'm experiencing.

I see, so you are saying that the preferable situation is to be completely screwed, so long as everyone else is screwed too? ;-)

Surely there's a better deal than martyrdom in multiplicity!

Actually, the implication isn't, in fact, that the world is something only you know. You as a person, that is. But it's very hard to describe, due to limitations of language. It would be something like this:

- Imagine there is a blanket of material.
- Now, imagine that this blanket has no properties, except for something we'll call "awareness".
- When the blanket is flat, the only experience the blanket has is "existing".
- At this point, we introduce folds into the blanket.
- Now, the blanket is aware of itself relative to itself. In other words, one "fold" can see another "fold".

So we have this situation:

- The blanket is the only thing that exists. That is what you truly are.
- However, the blanket is experiencing itself being all these folds.
- Your current experience of being-a-person corresponds to apparently being a fold, while actually being everything.
- This is true of everyone.

This means that you get to both a person interacting with others, but also the whole world and everyone in it.

The problem with thinking about this is, that not all the folds are happening at the same time. You and I are not sharing the same time and place, exactly. And that is literally unthinkable. There's potentially a way of describing that which makes sense, but it involves flipping things around a bit.

Ah, ok, I get it now. Yeah that's not terrifying. I was thinking more like everyone else was only in my imagination

Yeah, it's more like everyone is in or part of an imagination.

If the world is a continuous and coherent pattern, a blanket of material with folds as facts, then you can't adjust one fact without tugging a little on the rest of the material, impacting the other folds. Although these "collateral shifts" would make sense in terms of the fundamental nature - the blanket - they wouldn't follow the logic of the world's apparent content - the folds.

For instance, your car tumbles off the side of the road but - flash! - suddenly it didn't happen after all. Changing that fact inevitably results in a collateral shift of the world as a whole. But it takes the form of, say, an extra tin of fruit in your kitchen cupboard, a news reporter's hair being parted at the other way, and an acquaintance you've not seen in 10 years now never existed. Those changes are causally linked to, but not logically linked to, the event.

Quite possibly you would never encounter these updated facts. However, the change in your felt-sense of things - that "global summary" sensation that you have - might mean that the world sort of "tastes" different subsequently. You intuitively know that you are no longer in the same place. There's a different "flavour" to your life after the accident somehow.

...

That's a false dilemma.

That's a false interpretation of the thread -- which simply proposes an alternative viewpoint (to the one a couple of levels up) and then explores the implications to see where they lead.

nobody is saying you are "made from atoms"

I'm sure it's literally the case that people are, in fact. What else are you made from, then, in the standard description of things?

Another theory for you: parents forget a lot as they age. My parents have forgotten things I would have expected thought they would remember, and when I prompt them, the best I get is a vague recollection. Often they outright deny things. Luckily I have other family members that are younger and back me up, or else I'd think I was really losing it!

I think what happens is that, when you get older, you realise that life wasn't actually "all about you", and your parents had other things they were interested in other than being "parental" and remembering all about our self-centred escapades.

True, although with my parents, they've forgotten other things that are not just about me. It's a bit sad, actually.

Yeah, being less flippant for a moment: it does happen as you describe too, and there's something a little upsetting about it because it's a loss of part of your relationship, a shared closeness you have, in a way.

...

I realized it must have been a dream.

Out of curiosity: did you actually remember that you had dreamt it, or did you instead infer that it must have been a dream due to the lack of a reasonable alternative explanation?

POST: Update to yesterday. Things are better. Still wrong.

That sounds like a potential mangled reference to The Invisibles, the graphic novel by Grant Morrison which was intended to be a 'hypersigil' and has lots of reality-bending type aspects to it.

For myself, I'm going to recycle a metaphor that was used for the Remembering Memories From Other Timelines post last week, which uses the idea of a blanket to describe how a shift in one aspect of the personal world would have repercussions elsewhere which were hard to connect up logically.

Factual Updates and Collateral Shifts

If the world is a continuous and coherent pattern, a blanket of material with folds as facts, then you can't adjust one fact without tugging a little on the rest of the material, impacting the other folds. Although these "collateral shifts" would make sense in terms of the fundamental nature - the blanket - they wouldn't follow the logic of the world's apparent content - the folds.

For instance, your car tumbles off the side of the road but - flash! - suddenly it didn't happen after all. Changing that fact inevitably results in a collateral shift of the world as a whole. But it takes the form of, say, an extra tin of fruit in your kitchen cupboard, a news reporter's hair being parted at the other way, and an acquaintance you've not seen in 10 years now never existed. Those changes are causally linked to, but not logically linked to, the event.

Quite possibly you would never encounter these updated facts. However, the change in your felt-sense of things - that "global summary" sensation that you have - might mean that the world sort of "tastes" different subsequently. You intuitively know that you are no longer in the same place. There's a different "flavour" to your life after the accident somehow.

So basically, the butterfly effect.

No, because that suggests a domino effect across time, where changes makes sense logically according to a cause-effect process involving sequential events. There is no ongoing time in this description. We're dealing with a static pattern that is always "now", and the impact of shifting one fact is logically unrelated to the side-effects.

One way to view this: imagine there was a big sheet of paper, with a printed list of facts, one after the other, and that this list was the definition of your world. The facts are not in any particular order. By writing on the list with a big maker pen, you can delete or change things. However, the thickness of the marker pen means that crossing something out affects lines above and below. If you cross out the fact "my beer is empty", you might partially cross out "there are no elephants in Iceland" on one side and "my grandmother likes Matt Damon" on the other.

In neither case have you "gone back in time" to change the fullness of your beer, with a resulting ripple effect from that point onwards. You've just updated the fact directly, but because of the underlying structure of reality (the blanket or the list), changing that fact can't be done in isolation, so other facts which are unrelated in space and time and history and causality get amended also.

POST: Depressed about quantum immortality.

Trust me, there's lots more exciting and interesting things to discover, adventures to have, feelings to feel, people to love, even things to fear... followed by realising there was nothing to fear. Despite our occasional assumptions to the contrary, the world turns out to be infinitely deep and amazing.

The world also turns out to be literally unthinkable. In other words, the thoughts you have about the world are always wrong in the long run - but not to worry, if you let that thought go, there will be another better one along soon enough.

Which is a roundabout way of saying - Getting depressed about the concept of "quantum immortality" is like getting depressed because "everything is made from atoms", or any other idea which doesn't really impact actual living. **They're only a problem if you think about them all the time and make those thoughts into your main experience.

In somewhere between 50-500 years from now, the whole idea of both "everything is made from atoms" and "quantum immortality" will be laughed at. We'll be seeing the world a totally different way, a way which we can't anticipate right now. So why waste your time on such passing thought-fads, if you're not enjoying them?

Everything we think right now will turn out to be wrong. It will just have been "temporarily useful". But living will still be the same. So stop thinking, start living.

Speaking of which: Constructive Living and Stop Thinking, Start Living. Non-philosophical books which are good for getting back to life. And if you get stuck in a thought, you might try centring your attention on your lower abdomen and keeping it there - it's a real quick way to get out of your head area and get some relief.

...

Dude is talking about committing suicide and you're nagging him about exams?

It's actually good advice: Put that suicide stuff aside for now and concentrate on your exams; suicide will still be there afterwards. Although after that, actually, you might want to go out celebrating with your friends, so maybe put on hold a while longer. But then it's summer and the weather's nice, you've met this nice girl/boy, maybe wait a bit longer. But then the quantum suicide thoughts come back later... but you're now 85 years old and you figure, what the hell, there's not much point now, I'll be dying soon enough anyway, I might as well spend more time with my grandchildren, and I can always worry about it next time around.

Actually focusing on his exams might be good for him. Telling him he "needs" to be doing so might not be the best thing to say. Heck, telling a depressed person to stop being depressed is wonderful advice. I mean, it would solve the entire problem. I have, however, never met a depressed person that works like that and you should be careful firing arm chair psychology around like that.

Well, I wasn't telling him really, it was the above commenter - but if he could focus on his exams (or indeed anything else) that's the way out. In the end the only thing that works for depression is to... stop being depressed. You have to "change state". It's like being sat down. The only way to stop being sat down, is to stand up. Unfortunately, when you're depressed you're much heavier than usual. Meanwhile, if you're thinking of something that generates bad feelings, you have to stop thinking of that thing. Unfortunately, depressed people have usually ended up with very narrow attentional focus and have lost the ability to redirect themselves. So telling people things doesn't usually do much; you kinda need to actually budge them sideways. But maybe someone will say something that will trigger a brief flash of insight which will nudge his state and things will start flowing again. You never know. Maybe even a snippet armchair psychology might help! Because really, pretty much nothing else does. No-one can "stand up" for you. The reason I recommended the book, Constructive Living in my other comment was because it has a nice, straightforward way of laying it out which (from experience) can help shift focus in this way.

...

Q1: Hi. I have a master's degree in physics. Don't be depressed about quantum immortality, it is a crock of shit. Hope this helps.

Q2: Thank you, but could you please clarify why it is a crock of shit? (I am not trying to argue with you, my knowledge of physics is far too limited. I just want to know.)

He's saying (I have a physics background too) that it's meaningless scientifically speaking. It's not something you could ever construct an experiment for. It's a philosophical idea only. There is no reason at all to believe in it. Worrying about that is just like worrying about any of the religious ideas, like karma or reincarnation or heaven. It's got nothing to do with physics.

In fact, whenever you read about "many worlds" or any other popular non-mathematical interpretation of quantum mechanics, you should just treat it as a bit of fun and nothing more serious. (See this comparison of QM interpretations, for an illustration, and the comments.)

To be more straightforward: you should never feel hopeless as a result of any scientific or philosophical idea. Basically, it's all just stuff people made up! None of it is true - it's just useful. If something isn't useful, throw it away. Your focus on the idea of quantum suicide isn't useful.

For an example of a physicist pointing out how our ideas are just useful fictions: see here. It's written with reference to scientific concepts, but the essence is:

"It is a bad habit of physicists to take their most successful abstractions to be real properties of our world."

In other words, we shouldn't confuse our explanations with "what really happens". We certainly shouldn't spend time worrying about them. And if that's true of physics, it's definitely true of this stuff!

POST: Is this what going crazy feels like? (crosspost from Mandela Effect)

There is nothing in quantum physics to explain having memories of a different world, or timeline if you will.

Well, there's nothing in quantum physics to particularly suggest many worlds either, although it's one of a set of unfalsifiable interpretations that are fun. Many-worlds is a philosophical musing; it's not scientific. However, surely in the "quantum immortality" view, what's happening is that we are shifting "state" - shifting to a state where the "person" we are persists? And since each "state" is basically a complete set of facts of the world, that state must also include our memories. Therefore, such a shift might well result in a different apparent history, and differing memories. As far as "other observers" go, there's nothing we can say about that. We can only speak from our own subjective experience of an increasingly observation-defined view.

The way I use "shift" is to indicate that the content of our experience changed to a different state. Aren't you assuming here that memories necessarily correspond to prior experiences? Really, there is no history other than that represented in the current state.

Let's try this:

- Let's use the word "configuration" for the total arrangement of the world as held in my consciousness = (x, y, z, m). Where, for illustration, I am using "m" to represent the set of memories "in your brain".
- Each "state" corresponds to a particular configuration. S1 = (x1, y1, z1, m1), S2 = (x2, y2, z2, m2), and so on.

If you are in S1, then S1 includes all the facts of the world, including the memories, m1, in your brain. The memories aren't in the past, they are now but "about" the past.

If my consciousness suddenly becomes attached to (colloquially: shifts to) S2, it is perfectly possible for me to have a set of memories m2=m1. That doesn't necessarily mean that m2 corresponds to experiences I actually had, to the state of the world (x2, y2, z2).

If you choose to believe that, that's fine. But don't call on anything quantum to explain it, because that's utterly wrong. No quantum theory or possible interpretation explains why you would have memories from a different state.

Remember, I am not necessarily promoting such a view, I'm just outlining how it would work.

Personally I think that quantum mechanics as it actually is, has nothing much to say other than highlight the nature of observation vs abstraction. I'd be inclined towards a simpler metaphysical model which deals more directly with experiences arising in consciousness (although the result would be much the same). However...

No quantum theory or possible interpretation explains why you would have memories from a different state.

They are not "from" the different state, they are part of the current state but apparently "about" another state. Sticking to a physicalist model:

- There's nothing special about memories; they are just arrangements of atoms in the brain - B(x, y, z).
- The arrangement of atoms in the brain is not bound in an ongoing way, via a continuous causal link, to other arrangements of atoms in the 'outside' world, W(x, y, z).
- There is no reason why the state of the world cannot change such that the patterns of B(x, y, z) remain the same as in the previous state, while those in W(x, y, z) are different.

One might hypothesise that in a catastrophic circumstance, the total configuration S = B + W, goes through something like this:

- For the continuation of consciousness to "make sense", the configuration of W(x, y, z) changes to a safe situation.
- Meanwhile, since the brain is in effect always being observed, the state of B(x, y, z) is held in its current configuration.
- We end up in a final overall state, S(x, y, z) where the memories accessed from B will no longer be consistent with the subsequent observations of W.

Of course, if B(x, y, z) was not under observation at the time, then it might not be saved from change, and the inconsistency problem won't arise, and nobody would ever know.

EDIT: Obviously, we are assuming quantum immortality is a thing here, and trying to explain stories with it. If we want to go into the validity of interpretations of quantum mechanics, the nature of measurement etc, that's a whole other deal.

If you don't know what observation is in a quantum sense, you're not going to get to a satisfying explanation. It has nothing to do with consciousness at all.

Well, we can chat away about what constitutes a measurement or "fixing", but for us to get anywhere on this topic, we'll have to include consciousness, won't we? (And you already have, implicitly.)

Let's back up a moment and clear something up, which might make the rest of it sort itself out too. So far, we've not specified perspectives, or been clear what we mean by consciousness. And we can't get anywhere with this without switching to a subjective view, I suggest.

To me, it seems that you are visualising things "objectively", as a view from nowhere, with consciousness travelling on some sort of branching trajectory, almost like it is an 'entity' crossing a landscape. What is it doing - hopping from brain to brain? I think this has of problems, not least of which is that it perhaps means our trajectories must be fully deterministic? (See example later.)

So here's how I'm taking it (I'm changing B to M=memories for clarity):

- I am talking from the subjective perspective of a "conscious observer", at all times.
- That observer is in a state, $S = M + W$, which completely defines the world, and defines (is) its direct experience at that moment.
- The principle of "quantum immortality" says that the observer will always be in a state, and so will always have an experience.

Meanwhile:

- You have asserted that M must always be consistent with W.
- I am suggesting that M needn't necessarily be consistent with W.

I am suggesting that so long as the current state is always coherent as a whole, all is well. And M being consistent with W is not a requirement for this. It's perfectly okay for my memories not to match my surroundings. And this has to be true, surely? It's often true anyway.

Example

Say our friend above is about to die in a swimming accident, but obviously he won't because he's immortal. At what point does he not-die?

He's at the very bottom of the ocean, and gives out his last breath. What happens then? There is no plausible next-state that doesn't involve some sort of discontinuity. The next-state has to be one where it didn't happen at all. This is remarkably improbable, but it is still possible and by "quantum immortality" it is required. And it's more probable than him suddenly becoming a dolphin. So, perhaps he's suddenly on the beach and didn't go swimming, and has no memory. But in stories on this subreddit, people experience being reset to before their accident, or suddenly being in a safe location, and so on - obviously with memories intact. And this makes sense, right? Things should unfold until the point where there is no plausible next-moment, otherwise we'd have to be traveling along a fully predetermined path.

Assuming quantum immortality, he will survive in a world where his consciousness still exists.

This is the core of our disagreement. We're going to need to properly consider:

- What is a world? (You seem to be treating it like a "place" rather than a state.)
- What is consciousness? (You seem to be treating it like a "thing" rather than that which experiences a state.)

But let's continue...

Multiplicity, Forking, Determinism

Assuming quantum immortality, he will survive in a world where his consciousness still exists.

How many of him are there? Surely the only way to avoid multiplicity is to consider that there is one of him (one consciousness) that is in a particular state.

The moment of the last breath won't work because it's extremely unlikely that any event could change the outcome from that point.

My response would be that if quantum immortality is required then that doesn't matter. Probabilities are normalised, likeliness is relative not absolute. There is always a probability, say, that I will suddenly find myself on the beach, discontinuously. And as other options are eliminated, that probability might become 20%, 50%, 70%, later 100%. The alternatives are that "something" looks ahead and knows in advance, and so those unlikely options never arise - but that means everything is predetermined, which doesn't work surely? - or that they are lots of him and they fall one by one - but that makes screws the whole thing up.

So, we have to look at events that could change to prevent the death.

But if the events have already happened, they can't change? Your next-state might be such that it didn't seem to happen, and you may or may nor retain memories, but it can't "not happen in advance".

In this new world, his consciousness isn't identical. It starts to change at the moment of the fork.

When is this fork though? The fork must happen before the accident, while avoiding the accident is still plausible. What happens to consciousness then? The fork must happen before actual death. What do the other people see in the "world where he dies"; does he act like a zombie until he drowns?

at the point of death in this world, his consciousness would only exist in a world where the dying never happened.

But we've already said that the fork must happen before we get to the death? Unless there are multiple consciousnesses. Actually, how does a fork "know to happen"?

There is no reason to believe that memories of a different world could leak into this one somehow. It just simply doesn't exist.

In the subjective view, there's no 'leakage', because there aren't actually multiple worlds in a physical sense, and memories belong to the subjective perspective.

Objective vs Subjective

All these problems arise because (I suggest) you are imagining this from an objective perspective that doesn't exist: imagining a starting point, with forking happening at certain moments, spawning copies of worlds, and consciousness travelling along "alive" paths only - all as if this structure actually exists independently of an observer. If you flip it round to a subjective viewpoint, where the conscious observer has what amounts to a "private state", and each next-moment happens on a probabilistic basis, all of these problems go away. You automatically get "quantum immortality" because the conscious observer always exists; only the content or state changes. The world is the state of the observer. (This is the route Christopher Fuch's QBism interpretation takes, for slightly different but still related reasons.)

In this view, there are no rigid rules as regards memory, because all that matters is that at any moment the state itself is coherent as a configuration. And there is no problem with memory states differing from the state of the apparent world, they are not connected by an ongoing link to the past - no state has a past, it is completely self-contained.

This is philosophy, and there's not a lot of right and wrong answers here. I just think that if you believe in dualism, you should not pull in quantum theory to try and prove your point, because by definition, no science can possibly explain anything related to consciousness in that view.

Thanks, so I'm clearer about where you stand - I wasn't sure about how you envisaged consciousness and the multiple worlds. Just to say up front: I'm not a dualist, that kinda takes care of itself. The main thing is: there is no "outside view" to my take on this, which I think dodges quite a few hurdles.

You

So, in your description of quantum immortality, which is imagined from an objective viewpoint (you imagining being "outside" of the system and seeing this stuff happen):

- It doesn't really involve a particular conscious person living forever. It amounts to lots of duplicate persons (more accurately: duplicates at the point of creation, they then instantly differ) each of whom are conscious.
- Since forking happens constantly and started at the very beginning of the universe, we are basically dealing with a finite but enormous infinite number of worlds, each with a copy of our person (at this moment).
- Meanwhile, there is no communication between the worlds, they are sealed. From inside a world, strictly speaking we can say nothing about the other worlds.
- Those worlds are "made from" energy/matter.
- Consciousness is emergent somehow in some regions of that energy/matter but not others.

(This reminds me of why I think many-worlds is so ridiculous! Although it's fun because of it!)

In this view, we are envisaging that the multiple mathematical solutions of an equation are "real" and exist, even though only one solution is actually observed. Now, the problem with this is that it is unfalsifiable - but that's why we're doing philosophy here of course. :-)

The meaning of "quantum suicide" in this version:

- It's not so much that your consciousness persists, it's that one of the many consciousnesses will inevitably correspond to the path of survival.
- Really, this is many worlds, many deaths, single survivor.

Me

In my description of quantum immortality, which is imagined from a subjective viewpoint (from the point of view of an actual conscious observer, basically a person):

- We are only describing the situation of a conscious observer (or mind).
- The conscious observer is in a particular state, and will always been in a state. This is the observer's "private view" of the world.
- The current experience of the observer = that state, obviously.
- Meanwhile, there is no communication between any other observers. From inside a "private view", strictly speaking we can say nothing about other observers.
- These observers are made from whatever it is that states are made from - we could call it energy.
- The conscious observer is conscious by definition, and since the world is his state rather than something separate from him, there is no dualism or emergence to worry about.

In this view, we are envisaging that the multiple mathematical solutions of an equation represent the expectations of the observer based on his state. As more information becomes available, these expectations narrow down to a single value, which is the point of observation. The observation is "real", but the expectations are not. (Fuchs describes this better, of course.) The benefit of this is that it doesn't propose anything that cannot be observed.

The meaning of "quantum suicide" in this version:

- If a person exists, then they by definition survive because a person is a conscious observer (or mind) in a particular state.
- This is single world, no deaths, single survivor.

Joining it up

[EDIT: Apologies, had to rush this bit, so it's not as clear as I would like, hopefully you can discern what I was trying to say. Also: thanks for engaging in this discussion!]

So my problem with your "quantum suicide" - based on many-worlds - is that when you look at it, it's the story of lots of different people, most of whom die. You're having to sacrifice the notion of a single identity. The consciousness you are right now, reading this message, might be the one to die in an accident next month. That will be you, dead. Sure, another copy of you might carry on, but it won't be you. In my "quantum suicide" - based on QBism and "private views" - I really do survive forever. I am by definition always in the "winning" POV because it's the only one there is - my experience always continues, just by the nature of being a conscious observer. Now, obviously neither of them can be verified. Technically, if I shoot myself I can prove to myself that I am right. You, on the other hand, can never prove yourself right. However, I think my version potentially allows stories on this subreddit to be explained - such as the resets, the memory shifts, and so on - because memories do not necessarily need to change with everything else, memories are laid down sequentially as observations are made. Memories belong to the observer rather than to the world. (At a push, you could think of M and W, from earlier, as being two parts of a brain. Why would a sudden change in W necessarily cause a change in M?)

As you say, the laws of physics are obeyed, but in a squeezed situation, unlikely changes of state do become more probable relatively speaking. Just as there's a small probability an electron will tunnel through a barrier, so there is always a probability that the world will shift very discontinuously. Usually the relative likelihood is negligible, of course. But if in my version, I fall off a cliff and my body is destroyed, experience must continue from that moment, so one of the more unlikely outcomes must happen. There are no prior branches; there is only this observer, which is always in some state or other.

Note - The subjective version doesn't mean there is no shared world as such; it's just that the larger world becomes a dimensionless "shared resource" of information equivalent to "all possible states". There is no time or space between observers, in much the same way as there wouldn't be with multiple worlds.

Just quickly -

I like Tegmark a lot, but I'm not with him in his treatment of mathematics as "real", and the whole notion of consciousness being a "thing" that can be duplicated doesn't work for me. We've been round that same ride, with different wording, for hundreds of years. But there is much confusion about "consciousness" (its nature) and "consciousness-of" (its content) anyway, and often people are not disagreeing about the same thing, so to speak.

We can at least say we live in interesting times, what with neuroscientists like Chrisof Koch trying out panpsychism, and others also approaching the property of consciousness (as distinct from "self-consciousness" or intelligence) as fundamental. Good point on the proof on your version, of course. In either case, having no access outside of your own experience means you can only be proved right, to yourself - or be dead. I'd rather be alive than try to be right, in this case. :-)

Of course, what people really mean here when they say "quantum suicide" is just that in "some way" the notion of many-worlds means that they always live, subjectively. When you get into specifics and try and actually describe that, you're dealing with the problem of quantum interpretations multiplied by the problem of consciousness - i.e. these are matters of taste, not of science. So it can never be more than a bit of fun, although I think you can get quite close to a "pleasing" description. Anyway - yeah, check out QBism maybe. Why it's interesting is, it begins by admitting that there is no omnipotent view we can refer to, and so tries to avoid including fictional "objective" entities. Instead, it readmits the subjective view and tries to build out from there. I don't really agree with it completely, but it was refreshing in its avoidance of reification of the abstract. (See co-author N. David Mermin's article, if you haven't, for that perspective.)

Cheers for now - - -

...

It's not exactly like that. It's more like if an ant dies, then there are still a lot of ants that didn't die. The other ants will never have experienced dying. They don't suddenly have the memory of some random other ant dying. The only thing is, that since this is a series of universes that hold different possibilities, somebody there is going to look exactly like you with the exact same lifestory, except they didn't die. So you are not immortal. Your conscious may be, dependent on how that works, but that doesn't mean you get to keep the memories. In that regard it's more like, if you are fast asleep and somebody tickles you but you didn't notice, then you'll never know. Your body will know, because it felt the tickling, but consciously you'll never be aware. Which means that you'll simultaneously be aware and responding and at the same time you'll never ever know. If your body died, your conscious wouldn't know it got tickled one random night, nor would your body hold your memories if your brain stopped functioning. The memories are still separate, even if we imagine one could exist without the other.

Hey, yeah I was just trying to work up a formulation which fits OP's story (follow the thread for the details) and actually does give single-perspective immortality.

As it stands - and as you indicate - that many-worlds description isn't immortality, it's effectively a set of clones (not even!), one for each possible branch and hence outcome. If each clone has its own consciousness, it's not immortality, it's just survival of the luckiest clone. And how does consciousness get created at the branch? Or if there's one consciousness which transfers, then are the other clones empty? There are logical problems with that process. If it's a distributed consciousness but there's a notion of "attention" being on one, then isn't that effectively just a single perspective adopting different states? (Also: what is consciousness? Emergence is a hope, not a theory. Better if we can avoid the issue completely.)

Really, the problems arise from the idea of actual creation of branches in time, which itself comes from imagining an objective view which can never be experienced (the problem with most quantum interpretations).

If instead you switch to a subjective perspective (as some recent interpretations have sought to do), a lot of these problems go away. Instead of multiple worlds being created, never interacting, and struggling to account for the operation of consciousness, we have a "conscious observer" as the starting point. And the "world" is whatever state that observer is currently in, and the observer is always in some state or other. You can have all the same laws of physics, immortality is built in, and consciousness doesn't need to be explained - it's fundamental.

Here, instead of ever-multiplying non-interacting worlds with an observer inside them, you have non-interacting observers each of whom are in a world-state. Multiple observers are not connected in time and space (which are aspects of experiences) so their creation makes no difference, and in fact it makes no sense to talk of their creation since they have no context in terms of time or location.

Anyway, interesting to play with.

I did follow the thread. There is no problem with your theory, it's just not quantum immortality. Quantum immortality does not mean you have one consciousness that shifts universes. It means you have several consciousnesses, that are all active at the same time. To simplify, just think about it as having 6 senses at once. In each universe you have 6 senses. That may round up to several thousand times 6 senses, but they'll never interfere with each other. They all exist at once. They are not seperate, they're not clones and you don't "shift" into another universe (that's something else entirely). It's just that, when you die, you lose 6 of those senses. You can no longer sense them, but you still exist in all those universes where you still have 6 senses. Therefore, you'll never experience dying. You'll still be alive. And you already are. But your brain can only process 6 senses in total. So you'll never be aware of the fact that you exist in multiple universes. However, you have several brains as well, all experiencing their own universe. But they're still you in all senses of the word.

The point of the thread was to explore the notion of quantum immortality (in the sense of: a theory of immortality based on the concept of quantum states) as it could be applied to OP's story and to other stories of near death with subsequent changes - i.e. cheating death and having a subsequent discontinuity between memory and experience.

Okay, so let's pursue...

What you've described is the "attentional" model of quantum immortality, but it's fraught with philosophical problems, mostly arising from imagining "objectively" a system that can never actually be observed in any way.

EDIT: Actually, sorry, it's not even the attentional model. These are simply separate consciousnesses or aspects of a single consciousness, which operate independently and are therefore essentially separate.

It means you have several consciousnesses, that are all active at the same time.

I don't see how it can make sense to say that "you" have "several consciousness"? What is this "you" in that case? In what sense is another consciousness "me" if I'm never aware of it and can never be aware of it? Are all consciousnesses not therefore having an independent experience? Then, in what sense are they not actually separate consciousnesses?

Surely these other "me"s are as much me only in the sense that other people are me. In the sense that "consciousness" can never die - as independent from particular manifestations as "people". I-as-consciousness might be immortal, but my identity is not immortal. So when you say "still you in all senses of the word", that is not true in the way most people experience and conceive of themselves, which is as an observer with an identity and a history. It's basically a restatement of the mystical approach - i.e. that consciousness is undivided and eternal, although its forms may rise and fall.

Q: The point of the thread was to explore the notion of quantum immortality (in the sense of: a theory of immortality based on the concept of quantum states) The quantum states are existing in multiple places at once. It is not a switch. It is constantly existing in multiple places at once. as it could be applied to OP's story and to other stories of near death with subsequent changes - i.e. cheating death and having a subsequent discontinuity between memory and experience.

Which means you're not cheating death. You simply die in this universe, but you can't ever experience that, because death is the end of experiencing. You will only experience being alive, no matter how you look at it. The moments up until your death don't exist in the other states of your existence, and because of that, you would never be able to remember them. Because there is no switch, there's only two possibilities: You died or you lived. Since you can never experience "you died", you will only experience "you lived". And that's why, according to quantum immortality, you could never experience both, and so you'll never be able to remember dying. What you've described is the "attentional" (separate consciousness) model of quantum immortality, but it's fraught with philosophical problems, mostly arising from imagining "objectively" a system that can never actually be observed in any way.

The consciousnesses are still not separate. You still experience life as progressing linearly. You are constantly dying for one reason or another. As long as there is a possibility that you will survive, that's what you are going to experience. But it's all happening at once, that's where the quantum states come into the picture. It's not supposed to be observable. There are many theories that could be observable. There's nothing wrong with that. As I've said the entire time. But it's not quantum immortality. Quantum immortality is an unverifiable theory. That's why it can be taken slightly seriously, at least philosophically speaking.

I don't see how it can make sense to say that "you" have "several consciousness"? You don't have several consciousnesses. You have one consciousnesses, that exists in many places at once.

What is this "you" in that case?

Physically speaking, you is every atom that makes you, it is every electron being fired in your brain, and so on. They all exist in multiple places at once, according to quantum immortality (and they actually do, when you observe them). Philosophically speaking, you would not be the memory of another universe, as once these things that make you you cease to make you you, you can never experience that, nor can you access those memories.

Are all consciousnesses not therefore having an independent experience?

Multiple experiences at once.

Then, in what sense are they not actually separate consciousnesses?

Because the entire essence of quantum immortality, and the string theory, is based on the fact that on a subatomic level, things have the ability to appear in multiple places at once. So it's one consciousness in many places.

It's basically a restatement of the mystical approach - i.e. that consciousness is undivided and eternal, although its forms may rise and fall.

No, it's not. Those two things have nothing to do with each other. For one, quantum immortality is not actual immortality. It's just the fact that stuff can appear in multiple places at once, and as such, if it dies in one place, you can't experience that place, so you won't experience that. But that's only as long as there is a possibility that you may survive, because according to the quantum immortality theory, you will be in all places at once, so when you've run out of possibilities to survive, you'll not be able to experience anything at all.

There's nothing wrong with your theory, it's just not quantum immortality. Quantum immortality means things existing in multiple places at once. Every possibility existing at the same time, but not on top of each other. Just simultaneously.

Good coverage, and mostly agreed. Stripped back to (for simplicity's sake) an omnipotent view of "arrangements of atoms", all is well. The issue remains, on what we consider as "you" and what we think of as "consciousness". Which are both perhaps philosophical points, hovering at the subjective-objective border, and not really resolvable by thought or external experiment, I suggest. We might assert that these are identical with arrangements of atoms in the brain region, but without a way of connecting across

that border, it's not very meaningful to say so; it cannot connect to personal experience. So, in my (basically) banter on this before was an attempt is to take a subjective viewpoint and follow it through - because in reality there is no other - to see what intuitive notions of "you", "world" and "consciousness" would be, and whether they could be applied to explaining these people's glitch accounts. (Particularly because if we take "conscious observer" as the starting point, we can dodge the consciousness issue.)

Anyway, a question: What do you actually think of string theory, many-worlds? Do you consider them to be more than "a bit of fun"? Are they models to be taken seriously, or are they guilty of taking unobservable mathematical structures as "real things"?

[COMMENT]

Q: Yeah, with quantum immortality, it's not like you in the original universe somehow magically survived. That person would still be dead. But I still think the two are connected, because it's literally the same material (as far as quantum immortality goes, in reality, I'm not sure if I believe in anything). It's the exact same neurons, just now one less point in which those atoms can experience the world in the sense of being "you". But those atoms still exist, and they're still in multiple places, including those, where they are still observing the universe as a human. Because of that, I believe the views are all (or would all be) connected. Because they are the same material, all with the same background, only existing in multiple places at once. So while those atoms are still in a universe where they are not experiencing anything, they themselves are still experiencing in all the other universes. They are not aware that they are in multiple universes, but regardless, they are observing. And they all rightfully feel that they are the "right" atom, because they are. So together, they'd form the exact same sense of "you" that you are carrying right now. Which they are obviously also forming right now. So do you get to experience that? I'd say you already are. You're just not aware of it, because you are limited by a brain. But we know for a fact (or that's bad wording, but presuming the string theory is correct), that your atoms are in multiple places. So they are not limited, only your experience. And that's limited by a brain - that goes on to die. While the sense of you is still alive. I don't believe the "two yous" can be separate, when they are the exact same. Not just physically, but also philosophically in the way that both instances of you, or the particles in both areas, define themselves the exact same way. And I'd believe (and this is where this stops being quantum immortality for me, too, and becomes speculating on top of it instead) that it's all connected. I don't know what I'd call it. But I think in the sense of quantum immortality, I'd be scientific and say we are just parts of the universe experiencing itself, thus we are the universe. Assuming there is nothing outside of the universe, then that would make sense. We are built from the universe, by the universe, experiencing the universe, like a set of conscious Lego. And so I don't think there is a huge consciousness called The Universe, I believe it's just a way to process what's going on in more complicated terms. Just like one atom knows what to do when it encounters another atom, just in a larger sense: how a cluster of atoms knows what to do when encountering another cluster of atoms called, say, a bear. If that's how it functions, then it all boils down to the fact that we are just like a star or a planet; we are the universe. But that's just my personal belief. I wanted to say, but forgot, that I didn't say anything to discredit you, but with your last comment I feel like you realized that already. You obviously thought a lot about this. You're not just blabbering out of the blue and making stuff up as you go. I know you have an idea about what you're talking about. It was purely a terminological thing I was going to argue on. I can respect the rest of it. Besides, it's just fun to talk about, so I will never turn down an opportunity to write away. And... This is somewhat out of the blue and maybe I'm just projecting, but I sometimes feel like you may have death anxiety. Does that make sense? Of course if you don't want to talk about it, or I'm way off, that's fine. I'm just asking because I have death anxiety disorder (or, I'm pretty sure it's just diagnosed as anxiety disorder in many places, including where I'm from), so I know what it feels like and what thoughts it brings with it. I got it when I was 13, out of the blue, due to many deaths in my immediate family 5-6 years earlier. I never got to process those emotions, as my entire family was in grief, so they didn't have the capacity to talk to me about it. Besides, I just hid my emotions. I was a quiet kid who spent a lot of time by myself and enjoying my own company, so I guess people thought I was fine. Laid in my bed one night, as many others, and tried to imagine infinity, as I had done many times before. I liked the way you get that sudden moment of clarity when you understand what infinity is, and then swiftly forget as if it's something you're not supposed to know. My mistake was I tried to imagine being dead for infinity. And the moment I grasped it, I scared myself shitless. Of course, I swiftly forgot, so I couldn't tell why it was so scary, but I was terrified. And then I spiraled into depression for the next few years. Thankfully, it was mostly due to unprocessed emotions, and it took just a few months of therapy and some great tools from educated people to bring me back to normal (roughly speaking, it took a little more than that to get through the depression and everything) but it's how I found this subreddit, for instance. And it's also still a part of me, in the sense that I have never since attempted to imagine infinity, and I'll sometimes still have those thoughts. Only nowadays, I process them quickly and it can usually be undone by getting on my phone a few minutes or thinking of something else. So yeah, that was just to be open and honest in case you can identify with it. I know what it feels like to find out you're never alone no matter what you're battling with. And if you're not battling with it, then I may look ridiculous now, so please forgive that, haha.

[END OF COMMENT]

Hey, that was a great comment well thought out, will reply properly tomorrow.

...

The rest of your comment involves a whole bunch of philosophy and scientifically unexplainable beliefs, which is fine, I just don't like it when people abuse well-defined scientific principles to hand-wavily explain their personal beliefs.

To be fair though, quantum physicists do exactly this all the time (and I've known a few), as soon as they stray from the mathematics and very limited experiments. It comes with the territory on this subject. Scientists love their pseudo-science sci-fi (and sometimes take it as seriously) as much as the lay enthusiast, really. Actual science, on the whole, isn't particularly scientific, in the way that those from the outside imagine it to be. (EDIT: In the sense that it is not really a highly-structured endeavour, following a definite method, coupled with controlled logical thinking. Quantum mechanics itself was a total hack job.)

The whole twisting around to interpret the delayed choice experiment as "retroactively" doing anything is irritating though. If the experiment underlines anything, it's simply that our knowledge of the world is defined by accumulated measurements (Observation Accumulation), that new observations will always make logical sense in the terms of previous ones (Law of Coherence), and strictly speaking we can't say more than that. Nothing is "violated" except our fantasies about what state things were in prior to being measured. There is no retroactive component because nothing "happens" other than observation. Before quantum mechanics, we could indulge ourselves in a fantasy that we knew that something and what something was going on between measurements - no more. To be fair to the general reader also, typically they are learning about "parallel universes" from awful documentaries like the recent BBC Horizon edition, Which Universe Are We In?, which actually features Tegmark prominently (mostly playing with Lego, walking about a bit, saying suspect things about the reality of mathematics). Here's the blurb:

[QUOTE]

Which Universe Are We In?

Horizon, 2014-2015 Episode 17 of 19
Imagine a world where dinosaurs still walk the earth. A world where the Germans won World War II and you are president of the United States. Imagine a world where the laws of physics no longer apply and where infinite copies of you are playing out every storyline of your life. It sounds like a plot stolen straight from Hollywood, but far from it. This is the multiverse. Until very recently the whole idea of the multiverse was dismissed as a fantasy, but now this strangest of ideas is at the cutting edge of science. And for a growing number of scientists, the multiverse is the only way we will ever truly make sense of the world we are in. Horizon asks the question: Do multiple universes exist? And if so, which one are we actually in?

[END OF QUOTE]

It comes over like one of Philomena Cunk's Moments of Wonder episodes.

...

The question is though.. how could the particle at detector 0 have known the random path it's entangled particle was going to take before it took that path?

My suggestion: the detector doesn't "know" anything. Nothing ever "happens" except for observations. In other words, strictly speaking, no paths are taken, because "paths" are a narrative we infer based on the results of the experiments, and don't exist other than this.

POST: Universe doesn't want me to change my name I guess

The more you look, the more you find! Yes, it's a fascinating place, this place (whatever it is).

Actually, "pattern overlay" is meant to describe a mechanism too: that what you hold in mind is literally overlaid upon your environment, and can become entangled with it, creating a persistent observation. It's a fun idea to experiment with, to try and make synchronicities deliberately.

A little thought experiment:

The Owls Of Eternity

Imagine that there is a TV screen, and that the programme that's showing is the programme of your world as you are looking at it. You decide you want to experience more owls in your TV programme. How to do this?

For this, you draw a picture of an owl on your TV screen. From that point, the owl picture always there, but its visibility depends upon the rest of the imagery onscreen. When the dark scenes of the TV show switch to a bright white scene, suddenly the owl "appears" - it is "manifested". Now we adapt this to daily life. Imagine an owl idea being dissolved "holographically" in the space around you, and replace the notion of dark/white scene with appropriate contexts. Having "drawn" the owl into the space, you go about your day. Mostly the owl isn't anywhere to be seen, but wherever an appropriate context arises then aspects of the owl idea shine through and are manifest: A man has an owl image on a t-shirt, the woman in the shop has massive eyes and eyebrows like feathers, a friend sends you an email about a lecture at the zoo highlighting the owl enclosure, a newspaper review of Blade Runner talks extensively about the mechanical owl in the interrogation scene, and so on.

Fun eh? For background, the reason they are called "The Owls Of Eternity" is because of how it progresses from "maybe confirmation bias" to obviously not that. As you've noticed, it's not just that you are seeing owls around in the environment, it's also that events start arising which result in owl experiences. The owls start coming for you.

See below for a cut and paste of a follow-up comment that goes with the experiment:

Additional Owl Adventures

The crossover beyond possible confirmation bias to something less easy to dismiss, comes in the following steps:

1. The Owls Are Internal - You notice more owl-related stuff in the world around you. It could have always been there, but you are just noticing it more. This could be confirmation bias.
2. The Owls Are External - Events occur such that owls appear in your life. A friend messages you with an owl-related joke, a colleague invites to see a band called The Owls, your mother talks about how she has bought a DVD about owls because she's totally into them suddenly. This is coincidence surely, or, okay, maybe synchronicity.
3. The Owls Become Eternal - You notice that you actually own owl-related stuff. You have an owl-shaped lampshade in your lounge, your tea-towels all have owls on them, you realise your desktop wallpaper has lots of owls in the background, you find that the label in your favourite t-shirt shows the brand logo has an owl in it. These things must, surely, have been true before you did the exercise, and when you think about it you can summon memories of them and their history, but still it's kinda strange...

Confirmation bias or frequency illusion or similar?

On Confirmation Bias

As in "seeing more red cars because you are thinking of buying a red car and looking out for them". If you experiment, you find it's something more than that. I'd scale it like this:

- conf. bias > coincidence > synchronicity > "manifestation" > shifting > "jumping"

They're all just varying levels of "pattern selection" or activation or overlay, of course. The exact same attentional mechanism that's always happening when we redirect ourselves, just to a greater extent. The thing to consider is, what are you selecting the pattern from?

You might be tempted to say that we select the pattern from the 3D-immersive environment around us, but actually that apparent 3D-immersive environment is the result of pattern selection. Instead, we might consider pattern selection to be a filtering of the possible experiential images available in a 4D space. We are selecting events or moments from possibilities, rather than just zones from our surroundings.

POST: Telepathy is normal

So I guess saying that any thoughts are "your thoughts" is problematic, perhaps.

EDIT: Rambles and strained metaphors to follow...

Just because a thought appears in your spoken voice, doesn't mean it is "yours"- that it represents your considered view on something or it is "what you think"- any more than a muscle twitch in your leg is. Passing thoughts can then be viewed as merely part of the current state of your subjective world, just like any other sense or body sensation is. When you see your girlfriend lying next to you, that visual image is an experience arising in your mind, but you wouldn't normally say that it is "your" image of your girlfriend. The thought "I'm going to go" is arising in the exact same space as that image, and yet we tend to label it as "my" thought. Really, it might be more accurate to label such a passing thought as the world's thought. This leaves us with only intentional thought as being "ours". But following on from the above, perhaps that is really wrong too. The intentional act is ours but the resulting thought is not; intentional thoughts are best described as "the intentional creation of a world thought" perhaps. It's like we are all sculptors making modifications to a shared "shape". We confuse some parts of the shape with "ourselves" but actually that part is being modified by everyone else too. Telepathy is when we stop hacking at it with our own chisel (so to speak), notice the more subtle changes that are happening anyway, and realise it's not just "our" part after all.

I agree. So if this is common knowledge... why is it not common knowledge?
Do these experiences imply something more than physical existence? Are thoughts possibly metaphysical?
Also, why am I being down voted?

Actually, these experiences imply something less. They imply that both "physical experience" and "thought" are sensations arising in the mind, and that the only difference is in their persistence and intensity. The physical world becomes just a particularly bright, stable, 3D-immersive strand of thought which arises from a single "world-pattern" that underlies all your experiences (think: the sun obscuring the stars in the daylight sky). It's not common knowledge because this destroys the notion of an "external" world, and leads to philosophical idealism and eventually non-dualism. It's not easy to grasp conceptually - it changes how you must conceive of "you" - and it's contrary to the dominant narrative that we've been using successfully for the last 50-100 years (although the debate is turning). The voting is always a bit flaky here initially!

Do you feel that there was an effort to push away from the reality of non-dualism? Is there an effort to keep this suppressed? It seems as though half of the world has known the truth all along, and the other half is slowly waking up. But why? How did we forget in the first place?

There is no conspiracy or effort, other than the effort of people to pursue what they perceive as beneficial to them, and shape the world accordingly. These things naturally fluctuate, ebb and flow. People adopt the narrative that best supports their ambitions, not necessarily the one that is true; ambitions change over time. [1]

The "strong materialism" of the last half-century was really not about "material" so much as the underlying belief by many that our explanatory fictions were "true" - an unfortunate reification of successful abstractions. Prior to this the likes of Neils Bohr suggested that (say) quantum mechanics revealed the subjective nature of observation - harking back to the Greeks before the arbitrary objective/subjective division was introduced for ease of theorising - and recent approaches such as QBism are a return to that.

[1] Of course, this is complicated by the fact that the worldview you adopt becomes the "formatting" of your mind, leading to experiences which support your view, in a pattern-triggering feedback loop. This applies to your thinking about this topic also.

...

It's better if people realize this all on their own or with trusted people who care about them than over the internet.
That's why it's a faux pas to talk about this, why you're being downvoted.

I think that many people who have experiences that they can't explain are not fortunate enough to have the time or resources to "realize this on their own", or have trusted people who can help. Surely the great thing about the internet is that it can make others' experiences and worldviews available to them, even when those are niche and unusual, whereas before those people would probably... die in ignorance. Let's face it, most people read such things and dismiss them as a bit of nonsense, while also having a mild intuition that occasionally things happen. They think no more of it! But if they are already thinking about it, then surely it's better that they can come across some discussion before the synchronicity effect gets a hold of them. Society isn't ever going to be educated in a responsible way about this sort of thing, unless it's by people like the participants on this forum.

Some related thoughts, perhaps they might be useful - Something to maybe notice: when you are out and about vs at home, how expanded or contracted is your attention? If you were to think of your ongoing experience as a vast imagination room, would your attention be localised around your body or head, or would it be open and full and at the outer reaches?

Expanding your sense of "presence" to fill the entire space of your body, and then the room, and then beyond is a great way to feel alive and open and better (I have found). And although it may be somewhat daunting at first, it can be enormously helpful to expand this "space" out when you are interacting with other people. It's counter-intuitive (surely you'd want to protect yourself by withdrawing from them?) but including other people, the whole room even, in your "presence" dissolves them within you, makes them part of you and under your experiential control. It means they are not "other" and not a threat, and you pick up full information from them. I feel a large component of social anxiety eventually arises from the issue of being disconnected from your surroundings. Other people, without realising it, literally "share space" when they interact, and automatically feel each other out in a sort of "direct knowing" (this is the true nature of empathy). To the person who has accidentally withdrawn from that, situations involving other people become confusing - because they have one of their sense turned off. An additional trick, related to this, is to centre your attention lightly in your lower abdomen area when you are interacting with other people (and even just living life generally actually). This location is where the felt-sense resides, that "global summary" of a situation. This is where people "connect". It also tends to spontaneously open out your attention, make you feel more "spacious" and "here", for free.

I had been analyzing people rather than allowing myself to share the same space as them.

Right. It's the difference between direct-knowing and thinking-about. You know something by literally touching it, rather than conceptualising it. Trying to work things out sans overlap leaves you situationally blind, but unaware of your predicament. If you reach out and touch the surface of a table, you know it is textured and hard; you don't think about "hardness". You include it in your awareness and witness a direct truth. Really, you interact with something by becoming it - and that understanding leads to interesting places. You really don't need to think at all, except to choose what "formatting" you want to have overlaying your experience. When you think intentionally, you are literally tugging at the fabric of your "world-pattern". Note that passing thoughts are fine; they are just fragments of your world state briefly revealing a sensory aspect.

"Jumping" - For that stuff, I'd recommend you start simply. You might begin by summoning The Owls Of Eternity and then you might do the Two Glasses Exercise for a situation in your local sphere. Just like the other stuff we're talking about, you only understand it by having the experience, so the first port of call is to give yourself an experience.

I notice my most intelligent moments are ... but rather responding naturally to the given experience I find myself in.

An experience already implies a response, a problem already implies its solution - because this-moment already implies its next-moment. That's why it's good to keep intentions broad rather than niggling at details, I'd say. You'll notice that I say in the exercise description something like "knowing that it is now done, carry on with your life". This refers to not constantly playing with the world-pattern. It's what is meant by an attitude of non-attachment (being okay with whatever happens), and notions of "faith" and all that stuff. If you are sitting down and want to shift to a standing state, keeping thinking about "being sat down" would reassert the sitting state and prevent it shifting into standing. You can probably see the relevance...

I'd leave the hair thing for now, but you can certainly come back to it, once you have a feel of things and how it applies to you. For your initial experiments, it's better to choose something that isn't constantly within your attention, since until you are convinced, you will find it harder to trust. The overall approach is: you do the experiments, draw your own conclusions, **your results are the authority**.

POST: When I wasn't looking for it, I was surrounded by Synchronicity. Now that I'm looking, it's nowhere to be found. (Kind of a long read.)

I've been playing with this a bit recently. I say: Don't look for "messages" via synchronicity. Synchronicity is basically you experiencing the state of your own mind, via the senses. You might think of it a bit like a mirror - or better, that your mind is a perceptual filter. The filter dictates what subset of the extended dimensionless reality will appear in your ongoing 3D sensory moment. So, if you spend 20 minutes today imagining owls, as vividly as you can, as if they were in the room with you... you'll spend the next week encountering lots of owls. It's as if you have created an "owl-shaped hole" in your perceptual filter, and the "infinite light of creation" (or whatever) now shines through it, giving you owl-shaped experiences. The summary:

- Experiences leave traces which in-form subsequent experiences. (Leave shapes on your "perceptual filter".)
- Thoughts also leave traces, as in-form-ation, affecting subsequent experiences. (You can use this deliberately.)
- Synchronicity is the name for the experiential patterns which result.

So, not much good for messages since you'll just be seeing what you've been thinking and experiencing, as residual indentations on your filter (although you might get some insight into things you are thinking in the background that you're not aware of). Better to use the technique deliberately. You might not be into owls, but you are probably into something, something that would make you happier? Deliberately spend some time vividly imagining that, so that you are more likely to encounter/notice it. (It's a kinda magical approach, I suppose.)

EDIT: Note that you can think about more general "facts" rather than just images. Also, sorry to hear about your situation. Hope things turn around. Watch out for those owls. They can be sexy.

Nice. This is really interesting. So by imagining owls, we're sort of summoning owls out of the "infinite dimensions" of creation into our current reality. Have you played around with this in practice?

Yes, it's much simpler than the other ways I was looking at things.

My poor old Mum is great to experiment on with this stuff (I've already taught her how to win any arm wrestle without effort, and to find hidden chocolate via intuition - yeah, she'll be great at Extreme Easter Sports) and I gave her this metaphor to explain it and get her using it (excuse length, but perhaps others will find it useful):

The Imagination Room

There is a vast room. The floor is transparent, and through it an infinitely bright light shines, completely filling the room with unchanging, unbounded white light. Suddenly, patterns start to appear on the floor. These patterns filter the light. The patterns accumulate, layer upon layer intertwined, until instead of homogenous light filling the room, the light seems to be holographically redirected by the patterns into the shape of experiences, arranged in space, unfolding over time. Experiences which consist of sensations, perceptions and thoughts.

At the centre of the room there are bodily sensations, which you recognise as... you, your body. You decide to centre yourself in the upper part of that region, as if you were "looking out from" there, "being" that bodily experience.

At the moment you are simply experiencing, not doing anything. However you notice that every experience that arises slightly deepens the pattern corresponding to it, making it more stable, and more likely to appear again as the light is funnelled into that shape.

Now, you notice something else. If you create a thought, then the image will appear floating in the room - as an experience. Again, the corresponding pattern is deepened. Only this time, you are creating the experience and in effect creating a new habit in your world!

Even saying a word or a phrase triggers the corresponding associations, so it is not just the simple thought that leaves a deeper pattern, but the whole context of that thought, its history and relationships.

Now, as you walk around today, you will feel the ground beneath your feet - but you will know that under what appears to be the ground is actually the floor of the room, through which the light is shining, being shaped into the experience around you. And every thought or experience you have is shifting the pattern...

Asserting Facts

You can also use it to "assert" new facts-of-the-world. I leave it to readers to experiment and take this further - but instead of picturing owls, what if you asserted a fact?

You do this by "feeling it to be true" rather than picturing it, to allow for a more general pattern. For example, "people are always bumping into me on the street". I'm sure you could think of better "facts"...

Those were other examples, pre-room metaphor, but the same basic principle applies. Here's how they work:

- For the arm-wrestling, withdraw your "presence" from your arm so you're not tempted to try to make it happen. "Decide" that you are going to win, feeling the winning position - get out of the way and just wait for it to happen.
- For the chocolate-finding, think of your body like a "shell". Withdraw from it, letting it move as it wants. Command it, "body, go and retrieve the object", and get out of the way. Let your body go as it pleases.

In both cases, you are essentially declaring that something is going to happen - that it really already has happened, a "fact" on your timeline - and then staying in a state of "open allowing" to let circumstances unfold without interference.

Huh, this is really interesting.

And something you can easily experiment with! Particularly the first one.

Your body actually always works like this, it's just that you've got into the habit of constantly intending a "posture/position" for it, effectively asserting it stay in a fixed position - so in daily life you have to overcome that to move. Stop asserting the position, and it's instantly much easier (that's why we "withdraw our presence": this stops us re-activating the "staying still" habit).

...or just watch myself do it?

This.

And how hard is it to let go?

Have you any idea how ridiculous that sounds? ;-) It's better to phrase it as something you stop doing: stop interfering, or "absolute allowing". In terms of what it feels like, it feels like you are stopping holding on to your focus of attention, and it opens out in response. Meanwhile you adopt that attitude that you are okay with whatever happens, including nothing happening. Don't overthink it. In fact, one problem is you can't conceptualise non-doing, and you can't experience intending - you can only experience results. If you want a little exercise to practice (which I steal slightly from this great Missy Vineyard book which takes the Alexander Technique and discovers some of these ideas along the way, although not quite so extended), do this one:

- Lie down on the floor. Couple of books to support your head. Feet flat on the floor, knees up.
- Give up to gravity completely. Let go absolutely, of your mind, body and attention. Let them do whatever they will. Give up to "God" or whatever; abandon yourself. Release yourself into the space in the room around you; become that background space. (These are just different ways of saying "let yourself be".)
- "Decide" that you are going to roll over onto your side, but do absolutely nothing about it.
- Wait until your body moves by itself.

Eventually, it will. It'll feel like magic. Then realise that this is how it always is; it's just that you have developed the habit of tensing up your muscles, tensing up the universe, to hold it in position, or to "feel yourself doing something". The feeling of "doing something" that you normally have is actually the feeling of resistance of your bad habit, which you have to push through. Once you've got the "happens by itself" vibe, experiment with leaving your body functioning that way. Just "decide" things, and let them happen by themselves. One way of conceiving of this is to think of it as "allowing yourself to experience..." something; releasing in a direction, rather than moving in a direction. The experience is already there, you are just "letting it in". Letting it "shine through".

I've got a lot of time tomorrow; I'll post results if you want

Do it! Remember, you've spent a lifetime doing the opposite, so it might take a little while for the "moves by itself" exercise to kick in. But this is because you are still resisting a little. You might even feel a bit uncomfortable when it first happens, but stick with it.

Do you think this can help me find stuff I've lost, like my Gameboy from a few years ago?

Give it a shot. "Just decide" that the Gameboy is going to come back into your possession, and maybe feel excited about this. Then, see what happens. Something to note: Sometimes the gap between the deciding and the result can take a little while. For instance, if the object is not local, it may take a while before the sequence of actions you feel "inclined" to do (even unwittingly) eventually leads you there. But it's pretty reliable. Fear not, something is happening - remember, you can't feel intention at work, only the 3D sensory experience that results from it.

(You've set the pattern on the floor; you're waiting for the image to appear in the room.)

...No problem - have fun with it! :-)

I try as hard as I can, but I can't seem to really "let go".

Yes, it's not to so easy to let go if you try to do it. You're not trying to lose attention, or manipulate yourself into a particular state - you're just aiming to stop interfering and accept whatever experiences come up. You are not meant to be using effort at all. You are giving up direct control.

For immediate things, like "find the chocolate that's in the house somewhere", you feel an urge to go somewhere. But if it was in the car, say, you might later that day feel the intuition to fix a shelf, which means you go into the garage, and then you suddenly think "I'll just look in the car door sidepocket".

That's why, after you "ask", you need to let go and be okay with anything that happens. When it's time to take action, you'll feel the feel.

Also, this doesn't reach into occult stuff, does it?

Not really, just your extended memory or intuition, which you don't have direct access to, but you can allow to lead you. In effect it's not different to the arm-wrestling or being good at catching (technique: centre your attention behind your forehead, let your body move by itself). You're just trusting your nervous system to operate spontaneously and correctly, rather than trying to control things manually.

There's no danger of "possession" - that's just people being scared that if they loosen control, their own impulses and urges will take them over. Letting go can feel a bit scary though, because it feels like you are lowering your defences and becoming completely open. But you are only lowering your defences against your own self! :-)

Q: *[Deleted]*

No problem. Remember, the larger picture is basically telling yourself you want something, and then getting out of the way, forgetting about it.

The biggest impact is the just the simple one of stress-free living without tensing your body. The "imagination patterns" is then extra icing on top.

Very good explanation.

Thanks. Always trying to come up with good ways to describe this, even thought it's slightly not-describable!

Interesting, your stretching idea. Wanna share?

My general feel is that you can't harm your body so long as you aren't forcing it. If you switch you attention to the "open background space" of your awareness, then "just decide" what you are going to do in broad terms, your body will get the job done.

Micro-manage it though, you can't.

What my teachers always taught and tried to convince everyone, is that muscle reflexes that you would normally only be able to control yourself, like raising your hand, absolutely cannot be autonomic (visceral).

If you have got into the habit of "holding onto" yourself then you will indeed get in the way of things like automatic arm raising - because you are constantly asserting yourself into your current posture. If you do that, you then have to "fight past it" to get anything done. This is why people feel they are putting effort into movement and activity, rather than experiencing it "happening to them", as they should.

...

I just thought of something before going to sleep. Maybe your mom is influencing the other person's thoughts when winning those arm wrestles. I've been looking at some reddit posts recently about energies that we can transmit. I'll link them later. You may have seen some of them because I saw a post about it on this subreddit. This also makes me remember how I finally talked with a friend who also acknowledged the ability to visualize (while concentrating really really hard) what the opponent in a RPS game will do. And then win. Oddly, I have always visualized what hand will be needed to lose, so I have to quickly reverse the idea to make my decision and win. My friend would visualize the winning move. We did not test this on each other because I was too tired during that time period. Jeez, and I might as well share this too. I was playing CS:GO with a friend and some other players I was sort of friends with. I've played Counter Strike for thousands of hours previously, so I had a really good idea of how people move around in the map. So I ended up predicting perfectly where the opposite team would be going every single round, for almost all 15 rounds, until I realized that my microphone was off. I was shouting to my teammates where the enemy team was going, but we always ended up going somewhere else. My friend was impressed lol...but we would have won way more easily if my team had heard my directions. In this particular map, there are at least 10 places the enemy could be heading towards to defend (they were Counter-terrorists), and many other paths they could take to get to these places. A lot of choices. Basically, it wasn't chance. To reiterate, I accurately predicted the enemy's exact movements, which I know because there are points on the map where it becomes obvious where you and the enemy may have intersected or not intersected as the game goes on. So either I predicted accurately due to my extensive skill in understanding the enemy and knowing what choices they make based on previous map gameplay decisions and turnouts, or I used the method of asserting facts, and the enemy team followed my facts. Just as a note, I'm generally really good at identifying human patterns and conditions once I take a long time to learn them, so it's not impossible that I predicted their movements simply based off of our round wins/losses, and the previous choices in movement that the enemy and my team had made in the other rounds, as well as available money and weapons, which affect future game play choices. I've included this story because it combines mental gymnastics with asserting facts. Both are ideas you included in your comments.

Hey, good stuff!

I think it's not about her influencing other thoughts, although that's how someone could imagine that it was happening (and then the limits that implies would apply). It's more straightforward than that: she is simply deciding that something is going to happen and, remaining in a relaxed state, she is then allowing that to unfold (without re-deciding or preventing it happening).

Possible interpretations in general (pushing it out a bit here):

I say: We can't tell the difference between experiencing something we caused, something we influenced and experiencing something we predicted, because it amounts to the same thing:

- Although we encounter time in a "moment by moment" sequence, it is actually laid out like a landscape - always there even though you are only "looking" at a certain part.
- If we predict something, we are "reading" the landscape before getting to a location.
- If we assert something, we are "writing" the landscape before getting to a location.
- When we get to the location, it is whatever it is. We can't then tell whether reading/writing occurred specifically, or whether reading/writing occurred indirectly.

For instance, by "asking for information" you might be implicitly "asking for information that corresponds to your desire", which involves making the information correspond to your desire. The background intention or assumption behind the act makes a difference.

Basically, it's like you dream your world. It unfolds spontaneously according to the current "facts"; you have the ability to modify "facts" whether the evidence corresponding to those facts is present within the senses at that moment or not; subsequent experience will be in alignment with those facts. As suggested earlier: once we've made a decision about what's going to happen, though, we have to then not "re-decide" and thereby re-pattern events again, undoing our good work. That's why you need to be non-attached and allowing.

From elsewhere:

However you imagine that it works,
That's how it works. - TG

That's one take on it anyway: What you are sensorily experiencing arises as a 'transparent mirage' from the facts-of-the-world in the background. All intention operates indirectly, via adjusting the facts-of-the-world. We never actually interact with our sensory experience. We never actually "do" anything directly, instead we just experience things.

EDIT: Inserted earlier paragraph which I'd omitted.

Ever since I read your post there have been bloody owls everywhere!! I even bought a T-shirt the other day with an owl on it and realised after I left the shop!! You and your bloody owls! I mean, it could be worse I suppose, but it could have been better dammit! I have had to route out your comment again just to tell you about the curse you have bestowed upon me. Its no hoot I'll tell you that much, aw God damn it.

Haha, a hoot indeed! :-) Thanks for sharing.

You've got off fairly lightly: people who've done it more deliberately suddenly find that, apparently, they've been amassing owl-related objects for years without noticing...

Still, if it works for summoning The Owls Of Eternity, perhaps it might work for other, less beaky items eh?

The Owls are a good way for people to explore the idea, I think, because it can't cause any damage. Well, bar a few sleepless nights from nocturnal noise, perhaps. (8>)=

A nice way to think of this is, you are "recalling" an idea or thought-pattern into your experience from the background memory of the world (summary here with deeper links [*A Line Of Thought*]). Objects are like ideas overlaid onto experience - and more interestingly, aren't situations a bit like momentarily-present, environment-sized objects?

Worth experimenting with anyway, I would imagine (excuse pun)...

POST: Discovered this sub and have two things I can't understand

A few of those "crash didn't happen" stories on the sub. Did you notice anything else different about the world afterwards? Randomly:

[http://www.reddit.com/r/Glitch_in_the_Matrix/comments/ofqic/escaping_a_crash_by_flipping_through_the/]

This happened to both my friend, Steve, and his father. Steve's son was accidentally shot by another family member. Steve remembers seeing his son die in front of him, but suddenly his son was fine and had only been hit in a non-vital area. His father and 3 friends accidentally drove off a cliff, but suddenly were all back on the road. All 4 remember this very vividly!

So, basically these are Ctrl-Z events.

POST: A Hiccup In Time

[POST]

My husband and I just got home from my parents house. I have to take the interstate to get home. Well, we had just passed the tall buildings downtown and were coming around the curb on the interstate that's right before our exit when we heard a train blow it's horn not far from us. I laughed and said it sounded like a crash symbol and that it scared me, it was so loud. Then when the train stopped blaring it's horn, I suddenly had no idea where we were at. Neither did my husband. After about 30 seconds of silence we realized we were about to pass the downtown area AGAIN. Everything happened is less than a minute and we both witnessed it.

[END OF POST]

Q: That's trippy as shit! I've had some... eh... interesting things happen to me while driving, as well. I recounted one in another thread; the only one I recall in enough detail to actually talk about. I started driving with a dash cam about 2 years ago, though, and such events have utterly and completely ceased since then. The system, it seems, doesn't like to change things there is a provable record of; probably because there would then be concrete proof of the glitch and not just the ramblings of a handful be people who may well by psychotic (yes, I'm including myself in that group).

Of note in your story is that you say the train horn sounded like a crash symbol. That's not at all what a train's horn sounds like, but clearly it sounded like a horn at the onset, as you were able to identify it. Did it seem to morph into the crash symbol sound after it started? Was there any type of electrical buzz or harmonic sound to it that would have been atypical of either a train's horn or a crash symbol?

If you want to dig deeper into the "reality is a simulation" concept, google "Tom Campbell Calgary". There are 3 talks by him on YouTube, all given over the same weekend, each a little over 2hr long. The first 2 cover much of the same material, but it's important to watch both before watching the 3rd, since there are some different bits in them; anything he repeats, he's repeating for a reason. Pay really close attention from 21:35 to 29:11 of the first talk, though, if you're at all skeptical. In fact, watch that first to decide if it's something you even want to get into.

Funnily enough, I've not long finished reading My Big TOE. It's a bit of a slog, and I don't quite agree with it, but it's full of interesting reality-as-simulation stuff and pertinent to this sub. (I agree with him on the potential flexibility, but I think he overdoes the "digital reality" stuff.)

Probably easier to watch the vids - good call!

Q: Yeah, if my glitch experiences tell me anything, we're in an analog simulation; definitely not digital. But, then, he does talk about everything he says being a metaphor, and we do generally have a better understanding of digital computers than we do analog, so it's possible that's just another metaphor, as well.

Yes, he does emphasise it's a metaphor - I just feel he's a little enamoured with that one beyond its usefulness. It means he ends up talking about defined 'rulesets' when in fact I'd say that something more like 'established habits' would be appropriate.

At that level, everything gets metaphorical because the "basic stuff" isn't really an object anymore... it's the "non-material material" that objects are made from.

POST: [EXPERIMENT] Glitch Generation Test, I Need Your Creative Ideas!

I've got a couple of silly tricks that are good to try, which benefit from randomisation. I'll stick with the more obscure but easier to perform one for now. It'll sound odd, and it's not exactly an obvious glitch generator, but there's method in the apparent madness. Here goes:

- Choose a situation that you want to change, but one that you don't necessarily have much influence over.
- Decide clearly what the current situation is, and what the desired replacement situation is.
- Get two glasses.
- Get two bits of paper or labels.
- Fill one of the glasses with water.
- On the first label, write a word that summarises the current situation, and stick it to the filled glass.
- On the second label, write a word that summarises the desired situation, and stick it to the empty glass.
- With the two glasses in front of you, pause for a moment, and contemplate how your life is currently filled with the first situation, and empty of the desired situation.
- Then, when you're ready, pour the water from the first glass (the current situation) into the second glass (the desired situation), while really noticing the sounds and feeling and shifting of the water from one to the other.
- Sit back and see the glasses in their new state; allow yourself to take deep breath and feel relieved.
- Take off the labels, put away the glasses, carry on with your life.

The audience should feel free to try this one at home.

POST: What happens if you get stuck in an alternative universe?

Q1: it's a sad thing that /r/DimensionalJumping/ is closed. It was the best sub to explore this idea. According to the leading contributors of this sub, everyone experiences such timeline changes all the time but mosts are unaware of it, because of a mix of conditioning, brain automatic filtering, and our own memory limits. Also timeline changes are controlled by our unconscious mind. It's hard to control this part of our mind, but there are methods to tricking your mind that such or such thing is true when it's not (yet). It looks more or less like a metaphysical prey and its associated rites. According to the sub, by following these non-religious rites, you'll trigger successive timeline jumps in the direction of your wanted reality.

Q2: Is there a reason this sub was closed?

Q3: It has been said the sub had been started from the wrong basis (with a bad name to begin with) and it lead to confusion for newcomers. For example, the sub attracted perturbed people who got anxious about jumping into a bad time-line. My opinion is that the growing popularity of both the sub and u/triumphantGeorge started to turn the whole experiment into something a bit dangerous.

One version of the answer [POST: Ever heard of r/DimensionalJumping?]. Essentially, it became unwieldy to operate the subreddit as it was designed and keep it on track - as a dialogue-based subreddit where moderation would be via participation (the content would be in the comments, with everyone unpacking people's ideas and experiences, based on previous insights).

POST: Raining on me inside

UC, you insist on taking all the magic away... ;-)

...Understandable. Shitty stuff abounds. :-/

You can't escape from anything though, escaping implies existence and perpetuates things (in my experience). The rule turns out to be: no-one ever wins a fight, you have to turn away and forgive (=forget without trace). Very Biblical. All we can do is assert a new experience and open up to it.

Today the Owls Of Eternity, tomorrow the world! ;-)

On eyesight - now this is for something different but maybe it could help a bit indirectly - after years of mucking around with exercises and the Bates method and so on for variable short-sightedness, I realised that if I instead "sat back" in my head and "let the world come to me" suddenly my vision (or actually perception) was transformed. Can't find the original article, but there's a paper by the same person copied here: Seeing from the Core [http://www.reptilianagenda.com/brain/br121804d.shtml].

POST: Wrote a 'prison escape via tunneling' story featuring a 'Dave.' Five hours prior, a 'Dave' actually tunneled out of prison.

MuayThaiJudo: Write a story about a redditor named /u/MuayThaiJudo winning \$10,000,000 just days before Adriana Lima slip, fell and landed vagina first on his dick.

Q2: This is the most practical response.

Yesterday I wrote a story about a reddit user who wrote a story about how they wrote some dialogue about a prison break and then discovered that a reporter wrote a story about an actual prison break which followed the same scheme as the story they wrote. So everyone better watch be careful what they reply to this, if they value their tomorrows - I've still got my Word document open and the Cursor Of Synchronistic Doom is blinking...

Q1: Write a story about a redditor writing a story about /u/imalurkerwhocomments curing cancer while he wins \$10,000,000 on the lottery and moments later he actually does

I've gone one better and outsourced it: I've written a story about someone else who writes that story, thereby saving me writing the story but still, in effect, writing the story.

Q3: Things like this happened all the time when i was working on my science fiction novel, except it was with technology and scientific discoveries. Maybe I should start writing again.

Got any personal examples to share?

My favourite well known one is Philip K Dick's tale in How to Build a Universe... where his novel Flow My Tears the Policeman Said is later reflected in real life and a Bible passage he hadn't read. Whatever's on your mind does seem to get reflected in "external" events. We've covered mind-formatting & synchronicity before but the reality of it - your insides appearing on the outside - is never not freaky.

Q3: 2007: I start working on the story and set it in 2008. Some of the characters have PDA's to share information over long distances. A week later, Apple announces the first Iphone and Ipad. A few months down the line I've wound the story backwards in order to flesh out the story. I come up with a space plane to make the space portions of the story to work. I came up with a "Revolver" type aircraft engine which starts off like a normal jet engine and transitions into a hypersonic engine and eventually a rocket engine for sub orbital / low orbit travel. Skylon was announced 3 days later, and it turns out i'd described the XB70 without realising it. An as yet unwritten portion of the story takes place on Mars, and so I was working out how to keep the astronauts safe from cosmic rays and other nastiness, so I got to thinking about magnetic shielding. The next day a scientist releases a paper saying pretty much the same thing. One of the setttings for my story involves a highly implausible setting of a gas giant between the Kuiper Belt and the Oort cloud for some aliens to hide and repair their ship. According the Phil Plait of "Bad Astronomy" something like that may actually exist. I describe at the start of my story a spaceship full of dials and gauges which makes it to low orbit, and I was informed it sounds like an early Apollo mockup. I invented a mega corporation for my story, which I know call the "Foundation for Peace and Brotherhood" the back story being they started in Italy after the black death as a way for neighbours to help each other out, and over time it spread and gained influence etc etc. The original name was "The Medici Foundation" as I knew a little about history and thought it would be a good name to use. But guess what? There's other small things as well, like the "Lunar Ion Freighter" from 1959, which i thought at the time I would have had to defend to the death, but it seems that could have existed. Those are a few things, sorry for the wall of text.

Those are a few things, sorry for the wall of text.

Thanks, that's exactly the sort of thing I was interested in. There's something about writing fiction in particular which makes this phenomenon more apparent. Perhaps because it's a process where you are inherently more aware of what you are imagining. It's always hard to tell the difference between these ideas being part of a "larger movement" or whether our thoughts "pattern" our subsequent experience. I've been experimenting a little with (so-called) synchronicity and generating it deliberately. Lots of fun to be had.

...

Did he affect the ancient past with his powerful ability to visualize?

Thinking about this, it's not necessarily "the past" that gets affected, it's that subsequent observations take the form of previous ones. Even if a discovery is "about the past" it is really an observation of something in the present. So, Hancock "has the experience of" writing about about red-haired Neanderthals. Later, he "has the experience of" reading about an archeological exploration which finds red-haired Neanderthals. The "past" is nowhere to be found in this description except as "the experience of" thinking about the "past", in his imagination. All three experiences occur in the present, one after the other. Once Hancock has invented the "fact" of red-haired Neanderthals, all subsequent observations will be consistent with this new "fact" (even though he made it up).

Q4: Thinking about this, it's not necessarily "the past" that gets affected, it's that subsequent observations take the form of previous ones. Even if a discovery is "about the past" it is really an observation of something in the present. Yeah.. yeah.. yeah.. that make sense. I'll have to ponder some more on this. It's hard to talk about in lots of ways. There is some connection between observer and creation of "reality."

One way to approach this is to just keep it simple: [1]

Pay attention to the actual forms that arise, and not your explanations about them. Those explanations are just stories you invent to connect different observations. Also, don't separate out inside or outside: If you are experiencing anything, then it's a pattern arising in your "perceptual space" - it's all in the same "place". Looked at this way, it's like Hancock created a pattern in his "perceptual space" which then persisted, intermingling with and superimposed upon the other patterns that were going on - one of which was "reading about archeology". (Like mentioned in the link I posted above.)

He then ascribes meaning to this (via concepts of "the past" and "a world") but really there are no such things. Only patterns swirling around and unfolding in his perceptions. Of course, this brings up issues of identity and how the world is "shared" between us, if patterns in Hancock's experience result in patterns in our experience. This is solved if: there is no difference, there is no Hancock, or you, only perceptual patterns in one conscious space.

[1] Okay, so I guess that's simple in the sense of "there are only patterns" but not very simple to describe and think about! :-)

POST: Forbidden knowledge erased

[POST]

Has anyone ever felt like they've had a thought that gives you a deep answer or key to life, only to forget it seconds later? I've had this happen a few times recently. It's like a thought will enter my head, or rather be "pushed" into my head, that leaves me in awe. Then, it just disappears from my head and I can't even remember what it was, or a trace of it, no matter how hard I try. All I'm left with is the feeling of awe, like I saw behind a veil to something incredible and someone whisked me away before I was able to fully see it. Anyone else?

[END OF POST]

It could be that the "thought" is actually the experience of the gap between thoughts - the raw openness - and so you can't re-member it. You can't remember it, because it can't be conceived of, and it leaves no trace because it's a lack of sensory content.

So a taste of death?

Hard to say. Some stories here and elsewhere would suggest that experiencing of some sort continues after experiencing "dying". Perhaps it's better to say something like: it's a taste of not-being-a-person.

...

"How can mirrors be real if our eyes aren't real?" :-)

So - it's probably more accurate to say that there are light-as-wave observations and there are light-as-particle observations - but beyond this "light" doesn't exist in any particular state, other than as a concept in a fictional narrative, a story we use to connect the gaps between observations. Light doesn't "happen" except for the observing of it.

AI: Aha! So if this goes for light, this should go for everything else too, right? Nothing happens except for the observing of it? So the observing, done by an observer, creates(?) (renders?) everything as it's being observed/experienced? So there is no world except for the observer and what he observes - and how do you separate the two? Is it even possible to separate the two?

Yes, it goes for everything! So there is no separation between the observer and the observed. We might think of "the observer" as being an open aware space in which his experiences arise - we could say that an observer takes on the shape of their observations. This does leave us with a couple of questions though, which I'll have a stab at:

- **How is it that the world appears to-have-happened though?:** It does seem like things have been going on while my attention was elsewhere, hwo can this be? This might be explained by "creation-by-implication". When we direct our attention in a particular direction, an experience is triggered which is plausible given the observations thus far.
- **If the world isn't out there then in what sense does it exist?:** Maybe it exists only in the sense that all possible experiences are simultaneously available - like all the individual frames of all possible movies being stacked in the projector at once - and all that changes is the "brightness" of them, varying in their relative contributions to our current moment.

It only seems like there's a world happening "out there" because we've got into the habit of selecting our next-moment based on the contents of the now-moment plus our history. Except when we slip up and things seem to shift discontinuously and break the rules - a "glitch"!

AI: I think you nailed it right on the head! I would even take it a bit 'further'.

When we direct our attention in a particular direction, an experience is triggered which is plausible probable given the observations thus far. My theory is that our experience of now is just a collapsed point of several probability lines. The past is a 'written' line, the now is the current focus, and the future is a string of probablity lines that are always in flux until you reach the next 'iteration of time' (aka. next delta-T) where it collapses and manifests as the most probable function. Each line of probability is continously moved towards or away from the collapse point (now) according to how previous collapse points have occured. In this model everything that can happen is possible, but everything that can happen has a different degree of probability of happening.

Yes, you can certainly describe it that way!

I've been trying not to use "probable" because (of course) we never actually experience probability - it's a tool, an abstraction, but some groups have taken to be objectively true lately. "Plausible" makes it sound more like what it is: a story we make up and make a judgement on. But "probability" is as good a metaphor as any!

Now the fun stuff. Given that all possible experiences are available, and it's our previous observations that define the contribution of possibilities (your "probabilities") towards future observations - is it possible to influence this?

All possible observations are "here, now" - even unlikely ones. Is there a way to make an unlikely one take priority? How can we force a glitch or discontinuous change?

AI: Well, learning from established physics and quantum mechanics, isn't it now a common understanding that whatever is observed becomes affected simply by being observed? So how to influence the possibilities could maybe be, at least first, to observe the possibilities in some way? How to observe probabilities/possibilities when all you are is "aware space" or "consciousness"? Imagination!! Until we get a machine that is able to calculate and/or discern future possible probabilities, I think that is as close as we're gonna get to manipulate the outcomes. But merely observing something and therefore changing/affecting it is one thing - if we assume it is possible to at least influence the possibilities in this way, can we assume it is possible to influence the possibilities in a controlled way? In a directed way? In a way that intends one possibility to become manifest instead of another? Or as you said, is there a way to make an unlikely possibility take priority over a more likely one? Here we would need experimental testing, re-testing and triple-testing. Let's set up the premises we would need:

- 1: Probabilities can be affected by observation
- 2: Imagination is a form of observation
- 3: Probabilities can therefore be affected by imagination
- 4: Imagination can be controlled
- Inference from previous premises: Probabilities can therefore be affected and controlled by imagination
Then do rigorous testing to try to disprove any of these premises. First and most obvious flaw in this experimental setup is it would rely almost entirely on subjective reporting (but then again, as we've already covered, there can't be observation without observer - it's impossible to get around the subject). But maybe that wouldn't matter, because in any case we could set up imagined possibilities, then have a subject attempt to control the imagined possibilities into a certain desired 'state', then observe if the 'outside Universe' conformed to the controlled imagined possibility or not, or if it did so to any discernable degree.

An excellent summary and I completely agree. The only area I would pick at would be the idea of an "outside universe", since such a thing can never be experienced. Earlier we established that there is no observer-observed separation. This means that we don't affect things by observing them, we bring them into fact by doing so. This means that the world is our accumulated observations, and that includes the observations of (apparent) other people. So, we hit a problem. Although we have ignored the situation for

2000 years, we are forced to admit (to re-admit) that the world is subjective and we each have a "private copy" or view of it. And this means that the experience of "observing someone use imagination to influence the world" is also a part of the private copy.

In other words, we cannot prove this to someone else, because that proof is always really to ourselves and within ourselves!

A1: Absolutely! And that's why I wrote 'outside Universe' with apostrophes ;P
Formulating it as "bringing them into fact" is as succinctly as it can be put, I think, because as words are limiting at best, this description says a lot about the apparent mechanics of this process. And yes, finally, it's impossible to prove anything, and even to ourselves that proof would be dubious. Our private copy of existence is like a self-referential loop, or a mirror placed in front of a mirror, creating an endless fractal of self-referential data. Oh, and even if we can't get out of our own private copy and therefore never know anything about any fictitious/non-existant 'outside' world, for practical purposes, the experiment could still be attempted in the subject-in-object reality view that today's science use, and would likely produce entertaining data no matter what the results were :) It would actually be interesting to test, if only on a very small scale!

Sorry, mere apostrophes just weren't sufficient there - it needed to have full quotation marks! ;-)

Because the looping/mirroring metaphor can get a bit tangled and implies two parts where there is really only one - I find it easier to describe in terms of the activating of already-existing patterns. This lets us dodge infinite regression and maintain the idea of an ongoing "now" - but different metaphors are good for different contexts anyway. As you indicate, we can't get out of our own private copy, because we aren't actually in it. Rather, the private copy is within us and it includes our bodies as part of the world! Even the latest interpretations of QM (such as QBism) are giving up on objective interconnected aspects, although they hand-wavingly say that maybe some sort of objective explanation might come in the future. (Nope!)

However, if for fun we at least allow there to be multiple "perspectives", then there's still value in doing the experiment. We can think of the world as being a shared set of patterns (rather than a shared environment). By contributing new connections or activations from our private copy, we are making those available to other copies - albeit indirectly - thus spreading the magic for everyone else! :-)

A1: Hehe. Yep. And on that note we conclude this circle jerk ;)
PS. Even "within us" brings up a separation problem, but all words would eventually be insufficient to describe anything. They work like approximations, always beating around the bush, indicating or pointing to that which it is beating around :P
PPS. This has been a riveting discourse to have after being awake for more than 36 hours!

Well done us for solving reality! ;-)

PS. Yeah, true, there's really no way to say it because all words and metaphors imply separation into parts and then a relationship in space.

PPS. Haha, well, I have a sneaking suspicion that lack of sleep helps rather than hinders these sorts of conversations.

Catch you next time!

POST: The silent, faceless fifth housemate in *The Young Ones* TV show

Really one for the /r/MandelaEffect subreddit. I suspect Ben Elton is just being playful here, and doesn't want to get into all the legal issues for having invented and used the character from the movie Ringu 15 years before he sold it to the Japanese...

Q1: Hi, TriumphantGeorge, always enjoy your posts. It was x-posted /r/MandelaEffect and the GITM Mandela effect thread shortly after here. It's unfortunate that the "glitch" and "Mandela Effect" terms became standard. The former implies a temporary error, the latter doesn't mean anything at all. "Reality shift" is a better term for most of the stories. The changing-histories type of shift was the first type recorded at Cynthia Sue Larson's RealityShifters site in 1999, Sun Dial Rality Shift. The "Alive Again" type of shift, later called the "Mandela Effect" is another sub-type of time-shift, specifically involving people, which has been stretched to mean all kinds of discrepancies between memory and evidence, but M.E. is a less descriptive term than "time-shift" or even better "history-shift". A full taxonomy of shifts would have at least a dozen types, but it's difficult to make one without assuming that similar effects are similar in origin, and that dissimilar effects have dissimilar causes, which may not be the case.

I agree, the categorisation is a bit arbitrary when we start to think about what such experiences might mean "fundamentally". While we want to avoid presuming that various shifts have a common cause, or have uncommon causes, we're still left with the practical requirement of organising things somehow so we don't end up with one big gloop. The reason that "glitches" and "Mandela Effects" are handled separately is partly historical - how the two subreddits arose - and partly because the "Mandela Effect" is a much more general category, usually not a direct experience, and is somewhat difficult to define, so it tends to dominate a subreddit unless it is kept separate. Of course, the dividing line is fuzzy, which is why your post, for example, and others aren't just removed. To some extent, this depends on the amount of effort put into the post, and the quality of discussion it generates. I'm still duty bound to point out that "there is a place for this" even if it's left to stand though!

Yeah, I think Cynthia Sue Larson's site was probably the first to log "shift" experiences in an organised way. Being a fully "curated" site, she avoids encountering many of the issues we do in a public forum type environment, partly because her site is in effect pre-moderated, but also because she holds to a particular perspective on what constitutes a shift and what is behind it (to some extent). We don't really have that luxury here - which is why we try to define "glitches" and "Mandela Effects" in terms of the experience rather than the explanation, even avoiding saying that change happens in "the world" rather than "in our ongoing experience". For example, even the idea that the concept "the world" corresponds to something actual - e.g. that the-world-as-it-is really is a "shared, spatially-extended place unfolding in time", or any other worldview- rather than being a convenient "parallel construction in thought", is potentially somewhat suspect. Even simple categorisation schemes contain hidden assumptions! Having said that, I'm working on an idea for sort of linked tagging for the other subreddit, which might apply to this one also, to try and counter the "memory hole" issue of subreddits, where knowledge isn't accumulated (the rudimentary search function really doesn't help much).

What does "parallel construction in thought" mean?

Very simply put, it's the recognition that you never get "behind" your experience of the world, that your thoughts-about the world are at the same level as your experience-of the world - and, if you attend to your actual 1st-person experience, both are made from the same "stuff". Loosely speaking, they are both bubbles of "sensations" within your space of perception; your ideas about the world are actually like a little simplistic mini-world of their own, with only a small overlap with your main strand of experience. Keeping this in mind (excuse pun) helps us avoid making "map is not the territory" type mistakes, and realise that: observations dictate the possible models; models do not dictate the possible observations. For this subreddit, where one might easily dismiss someone's experience (as in, what arose as sensory patterns in their main strand of experience), it helps us be clear about the distinction between the experience vs the explanation, and recognise that this is typically a one-to-many relationship (even though we typically default to the very simplistic "spatial world" metaphor without noticing).

POST: Question for people who have been (or know) about parallel universes?

Can you repost with a "[THEORY]" tag at the front of your title? Thanks.

But since I'm typing anyway... My first thought: If we go with the "parallel universes", you are not physically moving there (what would that even mean?) you are changing your perspective so that you are now experiencing that point of view. You inherently would never switch to a state that had no point of view for you; it would be meaningless. My second thought: Such parallel universes should therefore not be thought of as "places", they are more like potential experiences.

Q1: Sure. Does that mean some were there is a body sitting ther Your second point: but if there is a universe absolutly everything there must be a universe that someone breaks out of there universde and coem s into one that they are not.

Well, "universe" is just a concept, not a place. It's a name we give to an idea about a set of possible facts we might experience. So you can have the subjective experience of, say, the scene of the current room fading away and being replaced by a scene of a purple bubblegum landscape - and you might call that "moving to a parallel universe" - but that is a shift of your experience, not a movement into another place. Because you can't really talk objectively about that shift, it's not meaningful to say you went anywhere - and even other people apparently going somewhere, is really a change in your state. Anything beyond that is a fiction really. To go further, you really need to nail down: a) whether the world is shared and, b) if so, in what way exactly it is shared. It is not necessarily true that the world is shared in the sense of an overlapping 3D-space.

Word in the senses of unvierse not planet? If not then I am lost. I am not sure if I get it sorry.

Sorry, yes: "world" in the sense of "shared realm" or "universe", rather than "Planet Earth".

Q1: But I don't exactly see how if every posible thing happens in some universe that there isn't a universe were some enteres that they aren't meant to be. You have to remeber that this defention is made by this universe. There should be (if the theroy is correct (which you probably can guess I am a skpetic)) a universe with my defention (not that I have really stated one) which would make what I am saying feasble.

What I am suggesting can't happen is: you can't have the experience of going to a universe where you are not, because you are not there; if you try to go there, you will by definition experience a universe in which you are there. It becomes logically impossible for something to exist which "isn't meant to be", because the fact of it existing means it is meant to be.

But that means not every possible thing Happens. Because thats a posiblity

It is a logical impossibility. The hypothesis doesn't say that "for anything you can say, there will be a corresponding universe". It says that, implicitly, all logically coherent universes exist. So, just as there will be no universe where "red=blue", or "north and east are the same direction", there will be no universe where "things which do not exist in that universe, also exist". There may be a universe where somebody suddenly appears, and there is no record at all of them existing until that point, since that doesn't break logic, because both before and after the appearance, the universe remains internally consistent. However, that's not the same as "a person being in a universe where they don't exist" - because, as of that moment, they do exist there.

Q1: But Isn't logic a contract/ opinion? In Asia a common way to wipe instead of Toilet paper after is to use your hand and a built in water gun (bad description) then wash it afterwards. That comes over as illogical to the western community (or me when I first heard of it) logic isn't clear. Relgion is an example of that.

This is a different sort of logic. This is isn't the everyday version ("doesn't make sense!") it is the specific version ("these two things can't be true at the same time!").

[COMMENT]

Q1: What about schrodinger's cat? It feels that the definition is based off our universe (fair enough) but the assumption is that it is the same when you go into another universe. Well whats the cause? We are confied to the logic of our universe. Say the statment " the world is spinning". From this we logicly know

- the sun/moon/stars rotate above us in a pattern (pretty much consistently)
- Gravity has the same (noticeable) strength anywhere on the planet
- Newtons laws of motion
- We have seasons
- we have days
- All statments about time
All of these are logical statements right
Now Imagine if the world didn't spin
I have to assume that everything elses stays the same (which it couldn't/wouldn't/can't (one of those))
- 180 "days" of the year we are in the dark
- we would not have seasons.
- friction would change
there are probably loads more changes. But do you see what I mean
Last point Logic of what can't and can't be is a construct based on what we know.
Defention of Logic
Key word validity
definition of Validity
Key words : Logical (sort of circular I just realised) and Factual
defention of factual
Key word: situation
Defention of situation
a set of circumstances in which one finds oneself; a state of affairs.
A long way of saying it but our circumstances have lead us to build/come to these logical conclusions
Sorry for spelling as I am in a rush for a psych exam
Looking forward to your reesponse

[END OF COMMENT]

I do follow what you are saying - but what this comes down to though is what is meaningful. Specifically, what is meaningful to discuss. So, I can say that "there is a universe where things exist and don't exist at the same time", but the statement itself is not meaningful, unless I can clarify it further and resolve the contradiction in some way. I am bound to try to say in what sense does something exist and not-exist simultaneously. If I can't state what I mean, then I'm not saying anything. Which isn't to say that other universe have to be intelligible to us or correspond at all to ours - however, the most honest thing is to say that we can say nothing about such places because they don't make sense in our terms, surely?

(Good luck in your exam!)

POST: I'm a God and so are you

Maybe posting to /r/psychonaut for this? Thanks.

- *"A personal, everyday-mode experience for which you have no explanation."*

How do you know that I don't do acid everyday?

Heh. On the topic though: basically I think you are right, just not in the way you might assume. Your current experience is like an "imagination space" in which both inner and outer experiences (thoughts, sensations, perceptions) arise - there is no outside. The space = consciousness = **god = you**.

Q1: =you to:)

Yes! Although that's where it gets tricky, right? - Because it means the world can't be a "spatially-extended place unfolding time". It's more like a bunch of ideas that we can pick and choose from... where "we" are conscious spaces that are somehow separate but also the same space, overlapping but not simultaneous, happening but eternal - n'stuff.

Q1: This is where the illusion part comes in handy haha. From my hippy bullshit perspective, it seems to me that consciousness is the fundamental truth of the human experience, but we are interconnected with this web of consciousness. It also has a source that seems to come from a separate entity/dimension and we confuse what we normally view as reality to something that isn't reality. Consciousness gets super crazy when you go down rabbit holes like I have gone down, but even Buddha at one point said that the world we observe is an illusion. Which is something that is now being posited as Hologram Theory in Quantum Physics, but people have interpreted what Buddha meant differently as time went on. Maybe he really meant that the universe is a hologram, but maybe he only meant that "We see what we want to see in the world." Does that kind of make sense? I'm trying to get better at explaining things, but in my 25 years of this life I spent the first 19 of them in a cave of anti-intellectualism, then like the next 4.5 thinking I was a genius because I read articles on the internet, and just in like the last year and a half have I realized that I don't know shit about anything but if I do have something figured out I need to be able to explain it better.

It make sense, yes. There's also the idea of the "two truths", which is pretty handy for finding a balance between the hippy and the theorist:

- There is **the relative truth** of the world as it appears, the content of our experience.
- There is **the fundamental truth** of the world as it is, the nature of our experience.

In a metaphor I quite like, we can think of (our) consciousness as a blanket of material, whose only property is awareness. There are folds in the blanket. The shapes of the folds correspond to our experiences. Those shapes are real experiences, however if we assume them to be real objects that are separate from us, we are mistaken: they are folds in the blanket, they are the "relative" truth. The "fundamental" truth is the blanket itself, taking on shapes. So:

- **Relative truth = the shapes.** (You can intellectualise about this, just as you can make shapes in a sandbox which are like other shapes in a sandbox.)
- **Fundamental truth = the blanket.** (You can't intellectualise about this, just as you can't make shapes in a sandbox which capture "sand" or "the sandbox" itself.)

You can get a feel for this right now, if you look around the room you are in right now: View the visual image of the room as "floating in a vast open aware space". Now think about the room next door. Is that room really "next door" right now? Is it "over there"? Or is it actually "dissolved" into the background awareness, waiting to be unfolded into the senses when you "go there"?

I think of this as: you are not actually a person in a world, you are an open space which is "taking on the shape of" a being-a-person-in-a-world experience. (Recent approaches like QBism seem to me to be getting closer to these views.)

The most important thing though, I reckon, is to realise that all descriptions are metaphors, stories, when it comes to describing content. This is pretty important, because if you start playing with stuff, you find that the metaphors you adopt actually shape the experiences you have. (Hence the infinite rabbit-hole issue, usually leading to massive synchronicities, where everything goes exponential.)

Anyway, you get the idea. Although the main idea seems to be that I have to use loads of quotation marks whenever I talk about this sort of stuff! :-)

That's a really cool way of explaining it, and one of the biggest things I've learned thus far in life is to doubt what I think I know, because I keep looking back on myself and saying "Goddamn, you were an idiot." But I think I will do this my whole life until one day I'll be like, Goddamn, for an idiot you figured out a lot of things.

Yeah, that's the thing: you never reach a final understanding of content, because whenever you go looking, you get another experience in response - you find more detail. There's always... more dream. So it's probably best to treat it like an adventure, an exploration, an associative traversal of all the possible experiential moments. Or that's what I'm thinking this week, anyway!

Q1: That's actually a really good way of looking at things. It's truly been a pleasure exchanging ideas with you. How about this one. What if time travel was developed at the beginning of the universe? Now we just have to obey the laws that the first time travelers made, and that includes seemingly not being able to time travel despite the fact that every moment of every day we are traveling through time? Rabbit holes man. Goddamn Rabbit holes.

Likewise! What if the universe never had a beginning, because time is an aspect of experiencing, and not a fundamental part of the universe? What if the so-called universe was actually an unbounded collection of eternal states, a sort of Infinite Grid of All Possible Moments...

Q1: Dude, I am really glad I keep throwing ideas at you right now. Are you writing a book or something? You seem to have some very interesting ideas about the nature of reality and such. The Infinite Grid of Moments is a mind-blowing idea.

Ha, no book, just all for conversational fun, and it's just new ways of rethinking and connecting older ideas really. Although I do think adopting alternative descriptions can help us experience the world differently, sometimes dramatically so.

(For instance, the idea that we "select out" our experiences from a pre-existing structure suggests that it's as if we are exploring a "memory block", and that living is an act of recall - a mode of thinking. Can I apply the behaviours I notice occurring in thinking, to living?)

Q1: Hmm, that's an interesting thought. I'm actually attempting to begin writing a fictional book about my life where I describe myself in the third person. I've been at this for about a few days, but my memories have gotten a lot more crystal clear after I started doing that. It's almost as if I was experiencing a mental block prior to undertaking this project.

Actually, here's a post I did a while back which is another way to look at it: The Hall of Records. It's related to viewing experience as 3D-immersive imagining: A Line Of Thought. I think it's quite a powerful way to view the world: the world becomes a "shared resource of experiential patterns" that are dissolved into the background of your awareness, rather than a "spatially-extended place unfolding in time". Interesting to play with.

...

A1: Today a young man on acid realized that all matter is merely energy condensed to a slow vibration, that we are all one consciousness experiencing itself subjectively, there is no such thing as death, life is only a dream, and we are the imagination of ourselves. Here's Tom with the Weather.

POST: [META]Let's pull the alternate dimensions and aliens and demons away for a sec- Your brain lies and takes shortcuts

One potential issue here is, you are invoking "the brain" like it is some sort of all-purpose explanation black box, without being able to go into how, exactly it accounts for the experiences. (Not your fault: nobody can.)

The Baader-Meinhof explanation, for example, is remarkably hand-waving as a "theory", as indeed are most descriptions invoking fallibility of attention and memory - because we lack actual models for those things (memory is particularly problematic, in terms of form and location; we don't know the nature of memory at all). These descriptions tend to be not much more than reformulations of the basic observation - they are often namings and categorisations, rather than actual explanations. Which is not to say that, um, "parallel universes" or whatever is the preferred explanation either. It's more about recognising the crap nature of some of the default generalisations we might invoke, as well as the crap nature of the more esoteric ones. Critical thinking, deep unpacking, applies to all potential explanations. We really have to take reports on a case by case basis, I think, because these categorisations often don't really respond to the details of the report, and are more like an "explaining away". (Of course I'm talking about the more in-depth posts here.) This is really a specifics-based topic. "it's just your memory" or "you were a child" or "frequency illusion" all rather depends on the exact context. It's also important to recognise when we simply do not have sufficient information to properly account for the experience. Which, here, is almost always. Mostly, the correct response is an open verdict. But that's okay, because - Surely the real underlying purpose of the subreddit isn't to "explain away" every post, but instead to use them as an opportunity to explore our hidden assumptions - the "facts" of the world that we take for granted which are not, when examined, particularly "factual" at all. They are more like automatic responses. Some of these assumptions are very fundamental - for example, even the idea that "the world" is a "stable, simply-shared, spatially-extended place unfolding in time". If one examines one's actual, direct experience, we might discover that we don't truly experience the world that way at all. That "world" is an idea that we think about now and again, but it might not be what we actually experience when we attend to our ongoing sensory experience. "The world" is, basically, a concept, and its familiar properties might just be habits of thinking...

Perhaps.

These things are fun to think about, anyway. And that's why this subreddit continues: because unpacking these ideas creatively in response to unusual experiences is fun and interesting. It's not necessarily about "being right" or "winning" an exchange by pushing a particular worldview as "how things really are".

Aside: I think there is an increasing tendency for people who are enthusiasts for certain subjects, but who have not read particularly deeply into them, to use that limited view as the basis for dismissal or promotion of a particular line of thinking. If you actually read the studies some accounts of "____ phenomenon" are based on, they are often pretty limited in scope and applicability. Meanwhile, if you are a popular science reader, your notion of the true weight of a particular theory might be incorrect - as in, the philosophical aspects, the "meta" stuff, may be lost on you, when it is this which often determines what it actually can be said to "explain" in the big picture view. Again, this all works both ways.

POST: Glad I found this sub. My glitch involves a huge apparent violation of conservation principles.

[POST]

The other summer I was working for some local growers. One morning I was filling a tub that we would wash produce in. There was already a little water in it because they'd been washing herbs (I think), and it normally takes about a minute to fill the tub up with the hose on full blast, if you start with it empty, but this time I stood there for well over two minutes—possibly longer, as I completely lost track of time—and the water level did not change. I checked the drain. It was plugged (and anyway the pipe wasn't capable of draining the water at anywhere near the rate that it comes out of the hose.) The water wasn't leaving the tub in any "normal" way as the ground was not getting wet. (It should have been getting soaked by gallons of water every few seconds.) The water level did not lower, mind you, but, again, simply did not change. As my mind was going through the list of possible "rational" explanations and eliminating them all, I started getting that weird feeling you get when you suspect you might be dreaming—the last potential "rational" explanation to be eliminated. One of my bosses asked if I had the tubs filled and I could only say, "Uhh...this one doesn't seem to want to fill." I still had the hose on full-blast and she saw that and just sorta went, "Oh...okay" and walked off, as I recall. (I don't remember if she came up to the tub and saw that it wasn't filling.) But after she was gone I simply turned off the hose and turned it back on and the tub started filling up as usual. The experience really didn't get to me because I fully expect reality, causality, our assumptions of temporal linearity, etc., to misbehave/break down/fail to apply from time to time. I know the world needs only to display enough coherence for our minds to be able to exist in it and process reality in a rough rule-based way, and this allows for a whole hell of a lot of "glitchiness". I'll have to try to come up with more experiences like that, but I know I've noticed enough weirdness like that that it doesn't bother me so much as fascinate me, which is why I started looking into things that led me to "time shifts", the Mandela Effect, and now this sub. Dunno that I accept some of the explanations as I prefer make minimal assumptions about the world outside what I can experience. But I definitely know that reality isn't what most people schematize it as.

EDIT: EDIT: The tubs are large plastic barrels cut in half length-wise, about three feet above the ground, with a PVC pipe running out of them. So basically the whole system through which the water moves is visible at any given time. If that gives you a better idea.

[END OF POST]

Q1: I have read that reality is not actually "out there" but is in fact created by our minds. So you might really be correct when you theorize discrepancies are caused by the individuals perception of reality. Things like: What if my color blue is your color yellow? How would you ever know? As long as it's consistent for this color, you'd never know. This actually is true for colorblindness, right?

Q2: the color thing (my yellow might be different from your yellow) is demonstrably false. my yellow is always your yellow

Q1: Didn't know this - can you elaborate?

Q1: it has a lot to do with the neural level and photoreceptor level. there may be a difference in intensity, and things like that, but my red is not your blue

I think the point is, that you cannot know another's subjective experience of colour (or indeed, anything) is the same as your own. Neural correlates can never lead us to that conclusion, since that amounts to saying (loosely speaking) that two "diagrams of the brain" are the same, not that two experiences are the same. It's the unbridgeable gap between the subjective and the "objective" - itself a concept, really, and actually an abstract container for a subset of subjective experiences - which does perhaps mean it's fairly meaningless to discuss (although still interesting to explore in terms of the assumptions it reveals).

POST: [THEORY] Virtual Reality and You.

[POST]

everything you've been told about reality as being a physical material world is false. We 100% absolutely exist in a virtual reality. The evidence for this has been known since the Copenhagen Interpretation of Quantum Mechanics back in the late 1920's. The Copenhagen Interpretation states that physical systems do not have defined properties prior to being measured. This means, an atom like carbon does not exist as a solid particle until measurement takes place. The double-slit experiment which I am certain most of you are familiar with proved that sub-atomic particles exist in two defined quantifiable states: A probability distribution or a particle. The criteria for a particle to behave like a particle is measurement. Throughout the years, more experiments exposed that not only sub-atomic particles behave this way but entire atoms and molecules exhibit the interference pattern. All matter exists in two defined states as probability and particles. The measurement problem is at the root of this enigma. What is the probability distribution? This is when a particle exists in a state of superposition. For example, the electron circling a hydrogen atom exists in all possible locations at once. The act of measurement causes decoherence collapsing the wave-function allowing only one measurable location to appear. The best explanation of what the measurement problem is comes from simulation theories. It looks at the probability distribution as information. Measurement becomes data access whereby the virtual reality simulator only renders information that is being accessed. The probability distribution is an exponential library of data, meaning its an astronomical probability database. It would be pointless to render all information at once. Instead, the simulator follows the Laws of Information Conservation only rendering at run-time data that is accessed. The particle that emerges from information is nothing more than rendered properties of information. This means we exist in a rendering. A composition based on information that describes the attributes which the simulator processes and outputs as reality. Understanding this basic fact is just the tip of a much larger paradigm shifting knowledge which involves you. You are part of this system. You also use virtual reality through which you experience yourself and the many compositions of virtual reality in which all of your experiences emerge. I'll give two undeniable examples of virtualism in your life which you can only dismiss as poppycock or actually sink your mind into and begin to understand just how deep the rabbit hole goes. The first example is the way you experience reality through the sensory model. The five senses are data input devices. They take information, albeit limited and constrained, and send this information to the brain for processing. It is the brain that interprets the data, calculates what this data means, and outputs a view of the data in a virtual interface that you, the observer can then make choices and act upon. Let's look at vision as it's one of the major senses. Light passes through the pupil through the lens in which it becomes inverted, upside-down and is two-dimensional when it reaches the retina. Rods and cones are then stimulated by the light, and this is where light stops. It is not light that passes through the optic nerve to the occipital lobe. Rather, a series of encoded electrical signals traverse the optic nerve. When it ends the journey at the back of the brain, it is up to the occipital lobe to process this data and convert it from optic signals to a visual rendering. It inverts the upside-down 2D image and calculates an approximation of 3D space. It then outputs this data into a visual interface which you interact with. All of the senses follow a similar process. The outside influences of energy and chemistry stop at the sensory cells and all is converted to electrical signals and sent to the brain for processing. It's easy to test that the brain is in fact rendering sensory inputs by closing your eyes. Suddenly the visual datastream is blocked and instead of a vivid view of the world, you are left with a blank black screen. Your perception of reality is entirely dependent on information processing. How you experience reality is through the rendering of the sensory data by the brain. There has been a lot of attempts to describe what this is. Ideas and theories can go all the way back to Plato and the Allegory of the Cave where Plato attempts to describe what one can see, touch, hear and smell is just half-seen images of the reality of forms. In the 16th century Rene Descartes introduced the Seat of the Soul which linked the pineal gland. Descartes theory amounts to imagining a tiny theater in teh brain, where the homonculus performs the task of observing all the sensory data. Danniell Dennet describes it in the context of the Multiple Drafts model. Charles Sanders Pierce described this as the Phaneron which is the real world filtered by our sensory input. More modern definitions come from Anthony Peake's Bohmian IMAX or BIMAX and Donald Hoffman describes as an interface. All of the above are ideological efforts to describe the simple fact that the brain takes sensory information and outputs this information into a view so that you, the observer can act on this output. Donald Hoffman's interface model is more accurate because the way in which the mind facilitates it's rendering of reality approximates with sufficient accuracy an interface to the outside

world. It is through this interface that you can then navigate the body through the observable world. In your mind, you see a door. The door in your mind is just a rendered approximation of the actual door in the observable world. It is not the real door. Just an interpretation of a door based on what your mind thinks the door is. You think to open the door, which causes the body to start to move towards it. The hand in your mind, which is a virtual simulation of your physical hand touches the door knob in your mind, successfully navigating the real hand to the real door. What happens in the mind, happens at the interface level. You simply interfaced with an interactive virtual reality as a tool to navigate your body. However, what is important in all of this is the fact you will never really know 100% what that door is because the constraints and limits of your senses gives you just enough information about the door as required through millions of years of adaptive survival based evolution. That is the first example of virtualism at work in your life. It has been that way since you were born and will continue that way until you die. It's simply the way it has always been. Even if physical reality is not virtual, the way in which you experience it is. The second example of virtualism at work in your life is the act of dreaming during sleep. Think about your most vivid and realistic dreams. The dreamworld is not composed of atoms, nor do you have physical senses by which to observe the dream. Instead, the mind does something more amazing through dreaming and actually simulates an observable world. Creates a virtual avatar simulating the physical senses but the mechanics of dream perception is the same as physical sensory models. Your mind takes virtual dream information that it's generating and interprets this into an interface so that you can navigate the dream world through the same interface that you use to navigate the observable world. The bridge between the dream world and the physical world is the interface of perception you use to interact between these two information systems. It is far easier to see that dreams embody virtualism because we know there is no physical structures present in a dream. Only thoughts. Dreams exemplify Plato's idealism, and it is here were we find his theories and ideas thrive and have relevance. Two examples of virtual reality and you. It serves to prove that all it takes to have an experience of reality is information and information processing. That information becomes fundamental to the observer. From these two examples of virtualism in your life, we can now go back to the the observable world, and begin to understand the role of information and information processing is at the root of what all reality is. It is with no coincidence that particles exist as probability distributions and only become rendered particles when measured. This is an expected requirement of any virtual reality. But we are just starting to unravel the mystery here. What is the information we observe? Where does it come from? What is running the simulator? How is it programmed? How does this involve you? Have you ever had deja vu? More importantly, have you ever had deja vu where you linked the familiarity of the memory to something you dreamed about in the past? You'll know if you have. I can only point out this relationship, and only some of you will have made it that far. If you have, then something even more amazing is presenting itself to you relative to reality and your relationship with it. That there is another form of dualism similar to particle-wave duality. You are seeing through your own experiences, in first-person a relationship between the dreamworld and the physical world. You may not understand why some dreams come true. It may invoke a large list of questions, or a myriad of beliefs. What it is revealing is that physical reality and the dream world are related. They are part of the same system. Want to know what is programming reality? Start looking here for the answer and there you will find it. It is through the precognitive dream experience that a much more involved creative process becomes exposed. It is here where you will find a part of yourself involved in the programming of the datastream which later renders out as an experience of reality in your phaneron. That's right. Your dreams are the programming language. You are the programmer. You may not remember this, it may seem entirely alien or outlandish that such an ongoing process involves you. If you have the type of deja vu linked to dreams, then you are just starting to see and remember this relationship. You are one step closer to knowing one of the greatest secrets that you've kept hidden from yourself. The Universal Computer which drives the simulation of reality is a you/me/us. It is akin to Carl Jung's collective unconscious. To really describe it, we have to move past the current distribution of this dreaming self-awareness and go back to a monolithic singularity of awareness, a time before this virtual reality emerged and we called it the Universe birthed by a big bang and became locked into the physicalism and beliefs. This is the way in which I have come to understand it. In many ways it explains God and how God created the Universe but I don't like to use the term God as it may invoke the idea that this is somehow not related to you and that you are separate from this in any way. So instead let's call it the self, or the Universal Self, because that is precisely what it. Before all of this, existed a Universal Self. It was awareness, and it could think. It's thoughts, like any thought formed a recursive feedback and we've come to know this form of thinking as dreaming. Thus this universal self-awareness started to dream, and through dreaming it began a process of self-evolution. Each new pattern of thought began to evolve and grow into newer patterns of experience for the self. Eventually, the manner in which thought could form these vivid dreams became the vehicle in which all reality would emerge. This dreaming self-awareness would find out that not only could it dream, but it could project a part of its awareness into the characters it dreams about. Eventually, it became like an awareness fractal distributing awareness into every aspect of the thoughts it was creating. It evolved into this collective distribution of dreaming self-awareness using thought as the language by which it communicates with parts of itself. It is this language, which is what we have come to know as reality. It is thought which has programmed the reality interface and created an astronomical number of virtual reality experiences for this Universal self. This is why for some of you who remember you can see in your dreams this creative process in which dreams are programming the datastream and later emerge as future events. This is because all awareness has to create reality with, is thought. And in the case of a Universal self-awareness, this thought becomes vivid dream simulations. Hence why all we really have is the self, and the dreams in which it thrives. You are the self, you are the dreamer. Hope this shines some light on what you really are.

[END OF POST]

That was a good read! More later but a quick thought for now: Really, "information" and "data streams" are things that we infer from our ongoing sensory experience, because we see that it is structured, and that structure implies a non-sensory persistent aspect to experience of some sort. So every time period has its particular metaphor to try and make this understandable, and that's fine - so long as we recognise it for a metaphor. It gets called the collective unconscious, the universal self, the dreaming awareness - but really it is not a thing at all, because it is "before" the experience of things. In some ways, calling it "God" - but not an entity god - might be the most honest, in the sense that it doesn't suggest a particular structure, and so we're less likely to take one metaphor as being "what is really behind the scenes". It is the "infinite gloop" whose property is being-aware, which takes on the shape of patterns and structure, and from which sensory experiences arise - and you are that gloop, imagining the world. Or more specifically, imagining being-a-world-from-the-perspective-of-a-person. I'm not sure that we can really take the step of saying that is a "collective distribution of dreaming self-awareness" though. The idea that it "projects awareness" into something... I think it might be better to say that awareness "takes on the shape of experiences", since there isn't an outside view with all these different experiences happening; it isn't laid out like an actual landscape unfolding in time. Then we don't have to work out how a consensus reality works - which is what we have to do if experiences are happening at the same time and place - because it isn't one.

...

To be fair, myself I assumed that people would interpret OP's post as philosophy or metaphysics, rather than as a scientific theory - but it's definitely good to explicitly underline that any interpretation of quantum physics is in the philosophical realm, and non-scientific. Not that "non-scientific" means wrong or not useful, it just means that its usefulness isn't attached to the "objective world" container concept. In fact... It's probably also valuable to emphasise that science is not a discovery of "what is really happening behind the scenes" - it is the cataloguing of a certain subset of observations or experiences, and the creation of conceptual frameworks and connective fictions to link those together in a useful way. That recognition alone might help stop the growing trend of people trying to use scientific models - as-is or with custom tweaks - to find the meaning or life or understand the nature of experience. That's like trying to build a sandcastle which represents both "sand" and "the whole beach", while not realising you are only building low-grade facsimiles of other sandcastles (and only ones which fall within particular design parameters at that). The early 20th century physicists seemed to know where science ended and mysticism began; I'm not sure the current science fans do. Which isn't to say that those conceptual frameworks or "thinking patterns" can't be reused in some way, but I think that trying to "scientifically" explain the nature of subjective experience as if it were an objective phenomenon is a waste of time. (Although maybe it is time to consider whether the concept of an "objective world" is still serving us well anyway - example.)

There is some scientific evidence that actually backs up the OP's post. It could also explain glitches somewhat.

I've seen the research before. For me personally, it seems to beg the question, and is another example of pattern-matching with our current favourite metaphor (universes and brains as simulations and computers). Still, as philosophy it's interesting to think about and may lead to good ideas. I don't think it particularly explains anything though.

Note for context: I'm with George Ellis on this, and don't think that string theory is science either. But as I say above, that doesn't mean it's not true in some sense and or that it's not useful. It's just not "what is really happening" more than other versions of "what is happening", because we are hitting the edge of our ability to observe "what is, really".

POST: Disappearing bus

[POST]

So I guess I'll start off by saying that this isn't my story (but I have another story similar to this where it happened to me, I'll post it later) it's my aunts and this was one that I always thought was very interesting. So it start off with my aunt, her husband, let's call him Joe, and their niece and nephew, Steve and Danica (age 7 and 9, if that matters). So while on their way back from Disney land in California they were driving when there car broke down. My aunt says they were somewhere in Baker (I don't know if it's a town or city cuz I'm not familiar with the mainland) and they were in the middle of nowhere and it was getting very hot, like she and the kids hid under a shrub to be in the shade while her husband flagged down a car. So they eventually got a car to pull over and take them to the city (or town?). When they got there they called a tow truck for their car and they went to a bus station. While they were waiting, a bus pulled up and asked them where they were going. They told him and he said something along the lines of "Well it's your lucky day, I have exactly 4 seats left and will get you to where your going". So they get on and my aunt sits the kids down (the seats weren't next to each other so she tried to watch them while in her seat), but Joe sat in the seat that was behind the driver. While they were on the road, Joe was talking to the bus driver and told him about what had happened to them, stuck in the middle of nowhere and having to lug there bags with them everywhere. The driver asked where they were going to stay when they got to their destination and Joe told him that they were staying at such-and-such hotel. (I should mention now that the driver was a middle aged black man, this is critical, really hoping I don't sound racist right now) So there on the bus chatting with the people for a few hours until the bus stops right in front of the hotel they were staying at. The driver helps them with there bags while they get off. They were baffled that the driver just dropped them off right in front of their hotel and was showing such hospitality toward them. When Joe tried to pay the man for the ticket (which they didn't get) and just give him a tip for everything he had done, the man refused. Joe insisted but the driver said that if he wanted to tip him then he would have to go to the Bus Company Office and send it through them. Then he got back on the bus and drove off. The next morning, Joe went to the Office and asked if he could pay the driver. But while he was there and describing the bus and the route (he never got the man's name) the people said that they never had someone on that route. When Joe tried describing the driver himself and that maybe he was just covering for someone, they told him that they didn't have any black bus drivers at all in that area. They tried looking through other things and records but couldn't find the man that my uncle had talked to. He just didn't exist. We have always refers to this story as the Greyhound Ghost Bus story. To this day they never could figure out what had happened or who the mysterious man was.

[END OF POST]

I love hearing these accounts. :) It's a nice reminder of how much help is available in times of need. :)

Q1: Or none at all. It's random. It's luck.

Of course, luck isn't necessarily random; it might just be unfathomable.

Q1: Luck is either just luck, or a meaningful coincidence. Or neither. It's random. :) I'm trying to see this without any "emotional context". It's hard to be neutral. Where nothing makes any sense, or everything makes perfect sense.

Or maybe I just like the word "unfathomable"! (And who could not?)

So, if we were to propose the notion of "subjective randomness", would that mean that the "tendency of our affairs" could not be predicted (we can't know whether we are going to be lucky or not) or that no mechanism could be inferred (we know we are lucky people, but can't work out how it comes to be) or a combination or neither? I feel that a defined concept of subjective randomness is required to tackle the "luck" issue.

Probably a matter of a true AI.

Hmm. I really think that **we are the only true AI**. The world itself is a dumb pattern, and we are the patterning intelligences. Perhaps we make a basic philosophical mistake in assuming that because our experience is apparently local, that our influence also is not global. We also make the mistake of thinking that the world "happens" in the same way and at the same time as our experiences "happen", which needn't be the case. Taken together, this causes us to infer external intelligences who influence our world, when it's really a case of not understanding the nature of our own actions and their impact. (Maybe.)

Q1: When I say a true AI, I mean a human mind without any "emotional context". By definition our emotions are what make us human. (I could expand further cause you seem like an interesting conversationalist, in a way, and you have your way with words, but my limited English make it a bit difficult. Hard to understand, hard to be understood.) :)

So, is this like an intelligence which has only "factual content"?

I tend think of emotions as "just" being another sense (visual, auditory, smell, taste, texture, emotion-feeling, global-summary, felt-presence, and so on), but one which can't be easily described in language. I don't think it is special, it's just not easily turned into visuals and sounds, pictures and words. So without thinking about this in depth, when I think of an AI without emotion-feeling, I am not sure that it would be more a "true AI" than one without (for example) hearing?

(Why don't we give it a try? We can always fail honourably!)

POST: Dreams

[POST]

I found out about this subreddit today and I thought this was the best place to post about what has happened to me a couple times before. Firstly, here's a little background. I'm from South America and I went to college there, I studied to become an engineer and the classes I took during the first semesters were somewhat challenging when you take them all at the same time (calculus, physics and chemistry) so when the midterms would come I usually had sleepless nights and more coffee than I usually have. So I was kind of struggling with this class, unitary operations (I don't know if there's another name for that, but in my country it has a lot to do with chemistry), it was the last week and I had 3 final tests that week, the test was at 6 am so I finished studying like at 4 am and I decided to take a short nap before getting ready, I fell asleep and I "woke up" sitting with my test in front of me looking at only one set of questions (where you have a big paragraph of information and a bunch of questions and you need to use the answers you get from the previous questions) then my professor walks to me and says: "you'll be able to use your notes during the test, bring them with you" and I started the test, I was about to finish it when I woke up to my alarm in my bed. When I was getting ready to go to class I could still remember the questions and I felt like I needed to do what my professor told me, so I took my notes and one of the questions was exactly the one in my dream, numbers and all, then my professor said: "I hope you have brought your notes, this time you'll be able to use them". There were other times when I would only dreamt about questions related to theory and text books, and these questions would always be in the actual test, this one was just the most weird I can remember. Has this happened to anyone? I'd love to hear I'm not the only one. I'm sorry if there's any grammar or spelling mistake, English is not my native language.

[END OF POST]

I had a similarish experience. The night before one university exam, studying late into the night, feeling that all was lost with a subject I disliked and was never able to get, I eventually went for a little nap and basically gave up. Shortly after lying down, though, I felt the urge to look at the stack of past exam papers one last time, picked two questions without putting any thought into the selection, and wrote out the answers to those two questions straight from my lecture notes - and went to sleep. Next day the

exam (which offered you a choice of two questions out of four) contained those two questions. I simply wrote out the answer I had written a few hours earlier. I had a few other experiences during that exam time of finding myself writing out answers intuitively, spontaneously, deriving them from the ground up for things I didn't think I knew - but that is more easily explained by lack of confidence and not realising how deeply I'd understood the material, even though it seemed 'magical' at the time. I think these times of high-focus and stress can often make the world seem more "dreamlike"; I wonder if those states amp up our intuition (or whatever) also.

Perhaps you were trailing other iterations of yourself across the space-time continuum, ones who already understood the questions and had already answered them.

That's seems to introduce a lot of extra moving parts that aren't required, perhaps?

So, putting aside intuition or in some way having derived the knowledge from prior encounters (e.g. things the lecturers said and so on), it would still be simpler to say that either: a) I picked it up via mind-reading from the lecturer, or: b) the future facts-of-the-world were in some way laid out, and I had just picked up the information in my nap time from that eternal and static "Landscape of Now". This avoids the problem of multiple "you"s and of different things all "happening" in time and remaining aligned. Unless by "you" already having solved the problem, you were meaning different moments of experience rather than actual different "you"s? In which case that is almost the same thing anyway, right?

Q1: Yeah. There are times when we seem to disagree when I am not sure that there is ultimately much disagreement. Language as we understand it is fundamentally about the illusion of the experiences we are having. Thus, it is fundamentally flawed in relation to discussion of the metaphysical nature of what we are attempting to discuss. "The Tao that can be named is not the true Tao", more or less. EDIT: "If language were liquid, it would be rushing in. Instead, here we are in a silence more eloquent than any word could ever be." -- Suzanne Vega

Or: since thoughts and words are also experiences, it is not possible to speak directly about the formatting of experience. We are then forced to conclude: not only can the nature of experience not be understood, **there is actually nothing to understand**.

I am not going to accept that shift in syntax at the moment, lest we relegate the ineffable and the numinous to empty sets, a conclusion which I reject out of hand. There is much to be said of the ineffable...L.O.L.

Well, you can stand (be the experience) but you cannot understand (have an experience that is "about" the experience, and have that be the experience). Although of course, understanding is its own sort of standing.

Q1: Hence, when we have a regress of comprehension, we seem to be in a poor position to derive any conclusion whatsoever regarding the nature of the cause of the regress itself. Thus, your conclusion of vacuity, while not falsifiable, seems not to be in any way rigorously supportable, either. A note to anyone who might be intrigued or amused by this sub-discussion: There is no edification here. This is all mental stretching, amounting to a series of farts in the wind.

I think there is no regression in fact - all experiences are made from "experiencing", just as all sandcastles are made from sand. The problem is that, having made sandcastles (thoughts) which are parallel constructions "about" other sandcastles (sensory forms), we assume it's possible to make sandcastles which are "about" sand itself. Really, all sandcastles are "of" sand but none are "about" sand. On note - Except my farts smell better, of course! ;-) Yeah, we are just having fun here, in case it isn't clear to "the reader from nowhere".

Yeah, you would actually have to not make any sandcastle for the result to be about the sand itself, which would amount in the analogy to not thinking about anything whatsoever, something which most people I meet seem to be quite adept at doing...L.O.L.

Aha, so is this where the phrase "ignorance is bliss" comes from? It was intended to be literal! :-)

More seriously: the way to realise the situation (your apparent world is made of sand and you are that sand) would be to change a part of your daily sandcastle which you had long assumed to be a permanent structure, thus revealing to yourself that the shapes of the castle were not fundamental at all. Your sandcastle is, in fact, a house of cards! (I love a mixed metaphor, me. Or, I love a mixed metaphor: me.)

Q1: Well, in relation to my overall general state, I assume either that I must be a rather lousy card player or that I need more water in my sand to shape anything. Of course, I might be having some mixed metaphorical drinks to confuse me, or is it metaphorical mixed drinks? Mixed cards? Shuffled drinks? This set of metaphors needs weed somewhere to be complete. Descartes walks into a bar. The bartenders says to him, "Will you be having a drink?" Descartes replies, "I think not". He vanished.

Perhaps we are putting the cart before the pigs that might fly?

Nice joke. Let me refer to my guidebook [<https://www.youtube.com/watch?v=4-xbVqDNXys>].

The worst part about the babel fish is that, when you have one in your ear, you can understand Vogon poetry. Also, you tend to understand why extra-terrestrials cringe whenever any Earthling talks about Belgium.

For sure, they are only *mostly* harmless.

Q1: Yeah. The word "mostly" did not get inserted into the Earth entry until it was too late. By the time the sub-ether update showed up, I was already eyeball-deep in trouble, and I have been stuck here for nigh on 45 years.

45 years eh? Well, still. Time is an illusion, lunchtime doubly so. Speaking of which...

TG Comments: /r/occult/

POST: Do Sigils really work?

Like everything else, it's a kind of "dreaming". I think of it as an "active metaphor". Play it out, play by the rules, you'll get results. You're playing out a little bit of theatre: creating an intention, wrapping it up in something, launching it like a rock into a pond, with the assumption-knowledge that ripples will result. Since ripples always result from rocks being thrown, you can leave things alone after the throw - safe in the knowledge that your "results" will, after a time, inevitably arrive at the shore. So long as you are "with" the model, it'll work.

POST: [deleted by user]

A1: Since time is an artificial construct built by the mind to split up unmanageable concepts (like infinity) into chunks that it can process, and as such, doesn't really exist outside the mind, yes, once proper control of the mind is gained, anything in it can be manipulated at will to one's heart's content.

Go tell Kant that time is an artificial construct

I would if I knew who that was, maybe. ???? First off, I am not an asshole. I have one, but I am not one. No need to resort to profanity. That is only an attempt by a weak mind to express itself forcefully. Secondly, I understood the question just fine, and I answered it in the best way I knew how, according to what I believe. If that happens to differ from what you believe, then that is your problem, and not mine. I do not have to get upset, offensive and resort to profanities when someone else believes differently than I do, as my belief system does not require either other people to think the same way I do or defend it. Go eat a Xanax, or have a bong rip, or a beer, or meditate, or whatever it is you do to chill out before you pop a gasket or something A question was asked, a response was given. They asked if it could be done, and I said yes, and explained

why I though so, no more, no less. Nobody is forcing anything on anyone. And a user can be well respected and still have a weak mind, or be a complete jerk, especially when it comes to being provocative and/or insulting, so that is no surprise at all, to me. Just because you or yer opinions are popular doesn't make you or them right Time for an end of discussion, (EOD) here, I think, so have a nice day and enjoy whatever it is that you find pleasure in, and thanks for chatting. Goodbye.

...

DD, you're a right cock sometimes but I did laugh out loud at your examples!

Q1: I'm a right cock, but I make OK points? Funny how only one of those things is ever emphasized. It's almost as if people here don't actually separate moral judgements from insights, as they claim we should. It's almost like we will always be judged as normal people while certain other people are put on a pedestal and any negative thing being dismissed as brilliant satire.

Well, you know your tone rubs up people the wrong way, right? You've got wit and things to say, but it comes over a bit fighty often. ALL CAPS is one of the greatest evils there is! ;-) Strong language is a barrier to communication, it just is. If someone is verbally punching your head, it can be hard to discern their well-reasoned arguments through the ringing in your ears. Maybe people ignore it because it's off-topic? Most people aren't thinking of the things you are, or seeing the world in terms of injustice everywhere. They're not thinking about excluding rapists and murderers, fir instance. Particularly not in a quirky wee post about (what if?) time travel. If you wanna talk about the other stuff, though, we can.

Harsh. :-) Y'know, PM me if you do want to talk about this properly. I totally agree about autocorrect - it's ruining my life now that it looks at the whole context.

...Got ya. Offer stands though for future.

Q1: It always does, and it never really helps. Everyone wants to calm down the retard after they make him snap. Everyone was the nerds friend after he shot himself, nobody would be seen with him beforehand. I'm only treated like a person when I stop acting like one. Until then I'm just some stereotype or label.

You're a passionate person who feels the world in a way that other people don't. Basically, other people simply don't feel the underlying emotional world situation that you do. This means that they don't understand the world you describe, and therefore why you are upset. What at first seems like aggression and ignorance, is finally revealed to be empathy and distress, and that where irritation turns into compassion. Unfortunately, inevitably, people have usually stopped reading what *seems * to them like abuse, before they get to that revealing point. For sure, there have been horrors, and the planet hasn't shown itself to be a very considerate place (mostly due to ignorance, but a lot due to greed and maliciousness). I've long admitted this to myself, and figure that we can only work our corner (although that can actually have far-reaching effects).

Well, by "corner" I don't mean geographically, I mean in our areas of knowledge, expertise and influence. So if I have ideas, I contribute them; if actions occur, I take them; a helpful word, I give it. There's no point in me fantasising about transforming despotic regimes in Africa, but I can keep an eye on oppressive movements closer to home - and so on.

I need to delete all this stuff now, and stop posting for a while. Sorry. My bad. Again.

No worries. Leave all the time discussion stuff though, yeah? I think that was useful and we were getting somewhere exploring it. Take it easy.

...

Q2: 'mentally' yes. 'physically' I don't know.

If you do it "mentally" and don't come back... is that not the same as doing it "physically"? As if you entered a lucid dream and then never resumed this waking dream.

Q3: there is no space in 'mental' unless you will it to, so you can come back.

Hmm. Is there even a space in "physical" though? Surely it's just the same as dreaming: space is part of the experiencing, not necessarily the world.

EDIT: What I'm getting at is that there's no difference between mental and physical time travel, until you experience "coming back". Just like you only know that you were dreaming (rather than being transported to another reality), when you wake up.

...maybe if you imagine hard enough/obe/astral project/whatevs that you can experience alternate realities or "time travel."

Because what would "time travel" be, I suppose, except an "experience that seemed like time travel". Interesting on your intro. The exercise you describe is one of the first types of things I did too - found some old 1970's psychology book where people (unknowingly) did a variation of Doors of the Mind and explored strange new lands and reported back, bringing knowledge with them. Having experimented a little with metaphors such as [the Imagination Room] and doing lucid dreaming and the like, it's pretty hard to ever say what is possible and not, purely in terms of what we've experienced. If we follow George Berkeley and the like, then there is no solid substrate underneath our experiences - our worlds are basically a matter of habit... I do wonder sometimes: Where do the ideas for fiction come from? If our experience is basically "imagined" anyway, then what is the barrier between conceiving of something and experiencing something - is it just a matter of it persisting?

Q4: Regarding where ideas for fiction come from, a few summer's back I started experimenting again (post partying stage) with psychedelics but in a more controlled environment. One night during this period I started thinking about how much of my life I've lived emulating characters and lifestyles that my favorite authors had created. It was kind of intense to think about how much of my life was spent following some imagined life of someone that doesn't exist. From there I fell into Campbell's Hero with a Thousand Faces. [http://en.wikipedia.org/wiki/The_Hero_with_a_Thousand_Faces] It made me start thinking about how it seems like we may just fall into this archetypal roles, but how we identify with them is beyond me. Which led me to start actually using the idea of the hero's quest to start controlling my life and trying to do things that would make an interesting story. I forget that it's a continuous experiment all the time and fall back down into my animal behaviors, but it's fun when I remember what's actually going on. The idea of reality being habit is interesting. As in matter existing due to energy taking the path of least resistance then even society being as such because people found or were trained to acquire certain habits. I need to read up on George Berkeley.

[QUOTE]

The Hero with a Thousand Faces:

The Hero with a Thousand Faces (first published in 1949) is a non-fiction book, and seminal work of comparative mythology by Joseph Campbell. In this publication, Campbell discusses his theory of the journey of the archetypal hero found in world mythologies. Campbell explores the theory that mythological narratives frequently share a fundamental structure. The similarities of these myths brought Campbell to write his book in which he details the structure of the monomyth. He calls the motif of the archetypal narrative, "the hero's adventure". In a well-known passage from the introduction to The Hero with a Thousand Faces, Campbell summarizes the monomyth: A hero ventures forth from the world of common day into a region of supernatural wonder: fabulous forces are there encountered and a decisive victory is won: the hero comes back from this mysterious adventure with the power to bestow boons on his fellow man.

[END OF QUOTE]

Ah, that's interesting, playing roles. We completely do this. A book I read fairly recently - Synchronicity by Kirby Surprise (check out a good interview here [https://www.youtube.com/watch?v=2-iMw9KA93U]) - had a fun section about how your life "takes on" the style of the character or storyline you have adopted, in a synchronistic way. You trigger patterns corresponding to that worldview. I've definitely done this unwittingly before, and more consciously more recently - adopting a "character" appropriate to the task at hand. (I've also played with the Michael Chekhov acting technique for this, fun.)

Yeah, Three Dialogues is the Berkeley text to read; it's quite approachable. Only caveats: Replace "soul" and "God" with "mind" and "extended mind" when reading the last dialogue, and focus on the point of the creation part rather than the Biblical reference. It basically nails the whole experience-of-reality thing; the only thing it doesn't quite touch is magickal-type influence (but then you realise you are the extended mind, filtered through a localised mind, and it becomes clear).

Q5: Without you the world stops eh?

Yeah, the buck stops here! So you better watch your mouth! ;-)

No, the world revolves around nobody. The point would be that "the world" is less like a spatially-extended place in which events happen, and more like a whole stack of dimensionless "facts". It is the perception of the world (by a "consciousness") which is formatted in terms of time, space and so on. A bit like Immanuel Kant and friends. Dreams sure feel like spatially-extended environments when you are having them, but they are not. So what makes us think that waking life is spatially-extended any more than a dream is? The fact that other people report the same experience? That just means that "human formatting" involves space and time as basic perceptual structures.

EDIT: Added the word "dimensionless", which I'd missed out and is sorta important here.

[QUOTE]

Transcendental idealism:

Transcendental idealism is a doctrine founded by German philosopher Immanuel Kant in the 18th century. Kant's doctrine maintains that human experience of things is similar to the way they appear to us—implying a fundamentally subject-based component, rather than being an activity that directly (and therefore without any obvious causal link) comprehends the things as they are in themselves.

[END OF QUOTE]

Sure every occurrence can be simplified to a bland statement of fact.

Ha, I missed the key word, and I apologise: dimensionless facts, as in they are not inherently organised in terms of space and time. We might call it "information" but even that is to frame it conceptually in a misleading way.

Time and space proven mathematical and historical realities. They are independent of humanity and will persist even with humanity's extinction.

That's plainly not true. They are experiences that people have, and the theories are also experiences that people have. Our theories describe the formatting and regularities of human minds and experiences, not of external worlds. I don't think any of our ideas predates human existence or will continue afterwards.

These perceptual structures are greater than humanity.

So, you are suggesting that human perceptual structures are greater than humanity, and exist even without humans? That's like saying that human bodies are greater than humanity, and will exist even if there are no humans. We have a Plato in the house! ;-)

Hey, this is an interesting topic...

Could you elaborate and give an example?

Perhaps it's better to say it this way: That the world as it is "in itself" is not necessarily of the form we experience it. It is our minds that format the-world-as-it-is in our immediate perception - in terms of objects, and in terms of space and time. Beyond our immediate perception, we tend to imagine that the universe is laid out in a way that naively corresponds to our experience of, say, this room. But it is just that: us imagining the universe as something, as a "shadow sensory experience".

So without humans to bear witness unstable molecules decay instantly? Riverbeds are formed and dried? Our universe created and destroyed?

All those things may be true simultaneously, in the same way that if I see a tail and then shift my attention and see a trunk, I don't have to conclude that a tail transformed into a trunk over time. I could take the bold step of suggesting that something - let's call it "an elephant" - existed throughout this experience, as a persistent and complete structure.

Your position is ridiculous and indefensible.

What is ridiculous about it? It seems more ridiculous to suppose that our mind-formatted experience corresponds to how the universe is in itself. That our concepts (and this is important: we perceive concepts, we do not perceive directly) are fundamental and are the "concepts of the universe".

Time, and the mechanisms the universe known and unknown continue to function with or Without a human to bear witness.

We cannot take the step of supposing that reality is organised in terms of dimensions, objects, and the like. We cannot study this. We can only study the regularities of the human experience - and even then, we can only make models of those regularities that can be conceptualised and communicated in language. Things like "time" and "mechanisms" are human concepts. The idea that the universe "functions" itself presupposes time! The universe doesn't necessarily function at all; perhaps it simply "is". Note, I'm not saying we should do away with the scientific method or logical thought. I'm just saying we must be clear about what we are actually studying. We are not uncovering the secrets of the universe, as popular science articles would have you believe. (This was not controversial among early 20th century physicists. Models were not confused with "truth".)

TL;DR: Theories and models are thoughts about human experiencing, and subject to the formatting and the restrictions of human experiencing. They are not thoughts about the universe as it truly is.

...

We need to define what we're talking about in order to have an opinion on what's possible. If we're not clear on what the experience of time actually is, then how can we comment? We don't know what exactly we're trying to do!

I have a glass. I break it. It is now broken, but further back in time it's a glass. I can't see it, but I can remember it. My memories can be wrong, but the glass could still have existed.

Exactly. What do you mean by "further back in time" in this example? Or "existed", in what sense can the past glass exist other than in memory?

Q6: We don't understand why gravity works, we can still discuss it without just insisting that it doesn't exist. The glass did exist outside of memory. If it didnt, there would be no broken glass in the present. That's not the point. We are not discussing how to prove the past happened or what it was. Now you are really double talking. If there is no time" then the glass was and is always there in that point, as is the broken glass. If time doesn't exist, the glass must be as it always was. If you actually believed that nothing ever changes, you wouldn't be on this sub I take it. A catapillar becomes a butterfly, it wasn't born a butterfly. If there was no time, there would be no change, there wouldn't even be a birth. We age. You were not born an adult. You changed OVER TIME and it's likely been recorded in photographs and video. Not just memory. If a thing can become something else, that means it is now something it didn't use to be. That implies change or at least entropy which is the thing we call time. Again, the word time is man made and an illusion, not time itself. People are an illusion, but they also still exist. My clock doesn't stay static, it changes as a tool to mark and measure the flow of time. I'm sure you've heard about the research with atomic clocks, one in orbit and one in earth, proving that the speed of time cchanges based on the speed you travel. That wouldn't be possible if it was an arbitrarily invented concept.

So, skipping along: Is it the object that changes or is it our experience that changes? Does the glass break or does our experience move from seeing-intact-glass to seeing-broken-glass? If the second one, how do we shift from one to the other? And where is seeing-intact-glass stored when not being experienced?

We need to know this in order to work out whether we can jump or not. How are we moving forward in time anyway?

Q6: Did that mean anything to you? No, it's a broken glass. I'm not imagining and seeing that it's broken. I can take it to another person who can see the broken glass. If it was just perception, someone should be capable of filling it and drinking from it. Where it's being stored is memory. That doesn't mean it only exists in memory, Mr semantics. You only exist in my imagination foe me, that doesn't mean you don't actually exist outside of my mind. We are moving forward in time because we are in time. Time is change. You age, gravity affects you, objects can hit you, this is only possible because of time. You can't age if there's no passage of time to alter your body. Gravity cannot work if an object can't be in different locations at different times. 3 minutes till I can post. the glass hit the floor and shattered. What possible reason does your brain have to make a broken glass hallucination if you have never seen something break for real? You can't say "tto make it seem real" when it only helps make it real because it's how the real world works otherwise since you are implying that it's always that way.

What I'm getting at:

- Does the "moment of experience" before the glass broke still exist in the background? And:
- Does time pass or do we (our conscious attention) pass over moments?

Q6: Either way implies that time exists. Your consciousness can't pass over a moment if there is no time and all moments are the same. 9 minutes. Funkcveryone. Funk google. Funk autocorrst. FUCK FUCK1FUCK. Five minutes. If it's just us moving consciousness through time, memory would be peffect. It's not, sl I think it needs rethinking. 4 minutes. if we got rid of all the christians, muslims, and jews, our country would be so much better. 3 minutes. Jewish people destroy the economy by hoarding money, that's why they were marked for extermination. They still use that as a defense for anything while continuing to lie, cheat and steal. They use to own slaves, but they live to tell a version of history where they were slaves who had to free themselves.

The difference is that time is an activity rather than an occurrence. This holds out hope for time travel.

Q6: Possibly, but that would imply that we would have some lighter version to practice and strengthen. As is, we seem unable to do more than remember parts of the past. I hope I'm wrong. I would love for it to be real. Maybe we can alter the speed that we experience it in the very least.

My feeling is that it is certainly possible to open our attentional focus and loosen our binding to time a little (as in, the rapid passing of the particular path we are on). If we believe in some ideas previously suggested by philosophers and religious texts - that the world is "eternal" and "all creation is done" - then it may be the case that we can jump from one time-based experience to another. Although done to illustrate something else, I posted this visualisation a while back to illustrate the idea of a consciousness + a moment of experience [The Infinite Grid of All Possible Moments]. But, y'know, this isn't time travel in the Back to the Future sense; it's about connecting to different parts of a (excuse the phrasing) universal memory-block.

I think equating time with memory is a bit of an issue.

Not personal memory in this case. Loosely, I'm suggesting that everyday moments might be compared to browsing the 'experiential records" in the "universe's memory". So time becomes the experience of change, of switching from one moment to another - which doesn't itself take place in time. (Yeah, I get that this sounds tricky. It's hard to describe; it implies another level of "time" in which attention moves from one moment to another, but we don't need to go there I don't think.)

And I conceive of this to be very similar to what you've said here:

. . . list of details that our imagination makes real and fills in any blank spots . . .

In other words, each "moment" would be like a list of "facts" which our imagination (minds) expand into a 3D sensory "experiential moment".

Maybe time travel would involve the "multiverse" of infinite branching possibilities" in which case you could probably find a reality to match any even false memory but I'm not sure if that's what you meant.

Right. Well, if all possibilities are available then in theory you could have any experience you could conceive of. Time travel becomes just switching from one "moment" to another one, as usual, but one that is dissimilar to the previous one. Also, phenomena like personal time dilation and expansion are easily explained - you are simply transitioning more slowly between moments, or even skipping moments. And it takes care of this "jumping universes" or "magick" stuff by saying: What you are doing is intending to switch to a moment where your desire is being experienced.

I do find your model of "time" to be pretty fascinating.

I think it might (hopefully) help make it easier to be able to think of some of this stuff. It's basically saying "look, you are a consciousness having a being-a-person-in-this-situation experience", and then it let's you focus on: How do we select experiences ("moments") we want?

I wish it was that easy. I have tried. I don't think any amount of meditation and belief will just take me to a better place. Sometimes your just an animal in a trap.

There's hope. But you gotta stop pushing. And start small. We were just talking about the exercise to do in the comments here [Super-Simplified Models of Reality]. Do it. Every day. Give up completely twice a day. There's not much point in doing other stuff until you've let your nervous system settle out a bit like this.

Q6: I still have a lot of work to do today, and I'm behind. It's getting harder to find time. It looks like an exercise I can do while working so I'll try it out. I just need a fucking break and nobody cares, nobody believes me. They seem to think overworking me will magically make me normal. I'm going to fucking die like this. I just want it to hapoen. I want to collapse from heat exhaustion and die. But I never do, and it just keeps going. Thankd, I'll try out the exercise later when I can read it.

It's literally lying on the floor for 10 minutes, but with a certain idea. Do it first thing in the morning, do it when you get home at night, any other time you need a break. Trust me: it seems like nothing, but it'll make a massive difference. But you have to stick to it, and when you do it you have to "give up". Always make time for it. 10 minutes stopping for it, your whole day will be improved and more efficient. To me you sound super-stressed!

Q6: *I am super stressed. I'll try, but I already do meditation. I can only do so much. Over stimulation creates more mental noise.*

Give up the meditation. You are probably trying to "do" it. (I speak from experience.) Just do this for a week. Literally, lie down and let go of yourself, twice a day. It's the opposite of stimulation. Here's the comment.

[COMMENT]

I couldn't find the exact link but I had it saved in a word document (that's how good it is people!)

Daily Releasing Exercise

- Twice a day, 10 minutes, lie down in the constructive rest position.
- Completely let go to gravity. Give up totally, play dead.
- If your body moves or thoughts come up, let them be. Just let them release without interference.
- If you find your attention becomes focused on something, the same: just let go of your attention. Give up, again.
- At the end of the session (don't worry about exact timing), decide to get up, but don't make any movement. Wait until your body moves by itself. This won't happen for a while, but during one session, it will.
- In general, resist the urge to interfere with your body and mind, to push it along. Settle back and let it run at its own pace.

[END OF COMMENT]

Q6: *That sounds like exactly what I need. That's an interesting practice. I'll make it my night and morning ritual for a while. Thanks!*

Great! :-)

POST: What are your experiences that have validated your belief that "holy shit this stuff works?"

Q3: *Made a sigil for a free bike. Got a free bike. Made a deal with an entity for money in exchange for harming an acquaintance. Friend lost his left arm while I made a fortune at work. Various successful "love" spells. It's not a question of whether it "works" for me at this point as it is a matter of using it responsibly in a way that makes me grow spiritually instead of getting caught up in material bullshit.*

Q4: *Made a deal with an entity for money in exchange for harming an acquaintance. That will come back to bite you.*

Q3: *Yeah, it did. The money I made went to immediately repairing some mysterious car troubles. Also, did I mention a friend lost their arm?*

Q4: *Yes you did. I hope multiple lessons were learned :)*

Sounds like he did:

- On the one hand, his friend lost an arm.
- On the other hand... oh.

It just goes to show that all this stuff does work, without moral filter. I don't believe in the "comes back to bite you" as an independent law though; I think it's something you do to yourself. Interested in other opinions/tales though.

Q4: *It just goes to show that all this stuff does work, without moral filter. I don't believe in the "comes back to bite you" as an independent law though; I think it's something you do to yourself. Interested in other opinions/tales though.*
Yeah, there are many "theories" about this, some as simple as Karma, some as simple as we are all connected and what we do to others we do to ourselves...my general comment was around the preponderance of evidence that what we "put out there" tends to come back to us.

I still file it under the "make your own mind up" heading. I think belief probably plays a part here as much as with any of it.

...

Q1: *I let my hood down, exposing my head to the pouring rain, not in hopes that the rain would stop, but because I knew it would stop. Within roughly two minutes, the rain stops.*
Be careful with this. It usually only rains in 15 minute bouts. Anyway, today I decided to meditate and set a timer for 30 minutes. I wasn't doing much specifically, but I was experiencing fractals and vortexes of light. More intensity than usual. I gave up on the timer eventually and noticed only 10 minutes had passed. Time dilation much? In my usual daily routine, time passes quickly. And afterwards I could think so much clearer. I should also point out that I haven't really used any drugs in the past few months, so that's not related.

Q2: *STOP DENYING HIS MAJIK YOU MEANIE*

Q1: *HE CAN'T CONTROL THE WEATHER BECAUSE I CONTROL THE WEATHER, AND I SAY IT RAINS OFF AND ON IN 15 MINUTE BOUTS*

I was gonna say that you better watch out, because I control ALL THE CAPS LOCKS IN THE WORLD! Too late.

Q1: *Too late?! You're going to have to convince me time is real. Checkmate, dream reality*

Damn you, Eternal Block Universe, scuppering my smartitude!

POST: Would anyone be interested in a more serious forum?

I think... people generally don't want to talk personally and in detail, once they get going. Because the experiences are personal, and the beliefs that arise from it are sometimes best kept quiet. Also... I can't take you with me, as it were, once certain paths are followed. Trying to, would prevent the process.

POST: Does it matter if it's real?

Well, what is "real" is shaped by what you accept. Basically, asserting a fact makes it so in experience. You might say that facts-of-the-world constitute a formatting of the mind - and that this formatting is what shapes and filters infinity down to the present moment you perceive. When you accept that "doing this means that will happen", you are inserting a new one-off fact - resulting in a future experience - into your mind-world. More generalised facts work in the same way, such as charging an object, changing a person, etc. The world is just facts dissolved into the background awareness, from which then unfolds sensory moments as our attention moves. We can each choose our own facts/habits as we please: The Experiential World = The Infinite Grid of All Possible Moments, filtered through Belief, Expectation and Knowledge, and selected via Intention = Your personal Timeline Trajectory (amendable) = The Ongoing Sensory Now

The difficult bit is describing the apparent interaction between these personal dreams. For simplicity, it's easier to assume "it's all taken care of" and you only have to worry about defining the rules of your own personal "hologram".

...

A1: A matterialist would say that if something is real then that matters, but if it's not real then that doesn't matter.

A2: hahaha, gravity is real, but we haven't seen matter so far.

Have you seen gravity?

A2: The movie? Yes, I have. What about it?

I was going to catch that in advance, but...

A2: Never saw the real thing, but for some reason I know it is real, in a way.

You've seen objects moving. That's it.

POST: What am I seeing???

[POST]

(This is my first time putting anything on reddit, so...be gentle?) I am somewhat new to the occult. I have something that I physically see sometimes that no one has been able to explain thus far. History: It began in my earliest childhood memories, when I was about 3 years old. When it got dark, at night, I started seeing a dancing, moving squiggle of "static", made up of tiny, tiny white circles with dark in the center. The longer I concentrated on them, the bigger and more refined/clear the squiggle grew. It goes away when I turn my attention away from it. Not knowing wtf was up, & being a 3-year old, I decided it was a harmless imaginary friend to play with when bored. At night, when I was alone, I'd "conjure them up" & distract myself from being scared of the dark. However, on multiple nights around when I was doing this, a Shade started visiting my room. My mother ended up seeing the same Shade walk thru the hallway on it's way to my room, before I screamed for her. They (my father was a Christian minister) did an exorcism on the house & I didn't see the Shade after that. More recently, I have acquired several friends in the Occult. I've brought up my "static squiggles" with some of them. They say they can feel it when i am doing it. They've been able to guess what part of their body it's on when I "project" it on them with their eyes shut. I also see it a lot when I try focusing on my third eye when meditating. One friend says they have a certain animal show up that is connected to me in their mind's eye when I do it. The same friend says I may be unintentionally doing something that attracts things from the spirit realm or that makes me "show up/stand out" to other entities, which could explain the Shade that would show-up the same nights I was doing it when I was little. Has anyone else here seen these "static squiggles" or read about something similar? Any ideas for what it might be? (Before anyone says I'm seeing "floaters" or "floaties", this is completely different. I also have floaters, just like most people & it looks nothing like that. I can turn the static on & off & see it in the dark & light. Completely unrelated.)

[END OF POST]

Like hypnogogic sparkles/fragments, more obvious pre-sleep but actually always there and available (just obscured but the brightness of the senses, like stars/sun)? Literally "the stuff that dreams are made from".

Related article I found interesting [<https://web.archive.org/web/20060511053653/https://cref.tripod.com/wakingsleep.pdf>].

POST: How to find something that was hidden from me by another?

Try this:

- Sit down. Quietly.
- Decide that your body is a "shell". You are simply an observer of its movements.
- In other words, you do not interfere. You simply allow your body-shell to move by itself.
- Command it thus: "shell, go to where <object> is"
- Wait for the shell to move by itself, to wherever it wants to go.
- Enjoy being reunited with <object>

EDIT: Additional point: Send Triumphant George a share of the treasure! ;-)

What is the word that even in plain sight remains hidden?

- Answer: Hidden

POST: The importance of belief is undeniable, what is a single line of belief that can change a life forever?

A1: “Today a young man on acid realized that all matter is merely energy condensed to a slow vibration, that we are all one consciousness experiencing itself subjectively, there is no such thing as death, life is only a dream, and we are the imagination of ourselves. Heres Tom with the Weather.”

(It's never not good.)

Q1: Nothing really matters.

Q2: Too meeeee....

Mama?

POST: Any well known people/celebrities/public figures that have admitted to practicing the Occult who you might not necessarily have thought would be interested in it?

Ashton kurcher and Milan kunis both study Kabbalist teachings and Ashton was seen wearing a free mason hat

"free mason" or Freemason?

Probably he's got a pal in jail, called Mason.

POST: Tapping Into The Collective Unconscious

Just... stop interfering. Let the ripples dissipate.

POST: Where to start regarding the occult?

Ask yourself what your purpose is in doing this. Don't worry about beliefs: they are all correct, as far as they go. Read lots to get ideas, but don't necessarily get hung up on one approach being 'the truth'.

POST: Freestyle Ritual

It's the meaning you give things, not the act itself - kinda thing?

Q1: Yes! You subconsciously know the ritualistic actions that will work best for you. Crowley knew the ones that would work best for him. I've never been too great at explaining myself but I feel like this will either turn out to be a good post or people will get pissed and think i'm an idiot.

Or it will be a good post filled with pissed idiots, because everything is permitted! ;-) Doesn't it really mean that, in the end, you don't need to perform any rituals or do anything much, except to 'decide that something is going to happen', and let it? The reason for ritual is because you feel that something must be done to 'earn' it, before you will allow it to appear in experience? After all, people might want power but the idea that you could literally just say something or think and it would happen, is quite disturbing...

Q1: "The flesh exists only to verify one's own existence" applies here.

Or as I was just saying elsewhere:

*TL;DR: We are dreaming.
As there is no solid substrate behind the scenes, we can dream anything - including being confused, or experiencing an 'illusion', or dissolving into non-dual awareness, or uncovering the Super-Real Truth Behind It All, which includes maybe even identifying a solid substrate behind the scenes...
But all of those are just more experiences; there is no real truth to be discovered, except to realise the arbitrariness of it.*

Q1: I feel like we would have some great acid talks.

Y'know, I've never partaken of the like. Which I suppose is quite worrying really: it means my mind is naturally full of this shit! :-)

*Q2: This book is incredible. Could you please tell me more similar titles and/or point in the right direction to find more?
Many thanks for posting it!*

Welcome! My main recommendation is SSOTBME: An Essay on Magic by Ramsay Dukes. Also - it may seem non-magickal at first glance, but the core sequence in this book by Missy Vineyard where she learns how to "allow movement to arise" is a great way into a larger world. You might also fancy experimenting with this to help "clear the desks" for freestyling intentions. Finally, Neville Goddard's The Power of Awareness is worth a look. That's what I'm playing with at the moment, anyway.

Q3: Same with medicine. It was all created and built upon by other people, probably people you've never met. I say make up your own ideas about medical care. What you're presenting as a logic argument is just plain wrong. I'm not saying that blindly following other's rituals is a good idea, and that coming up with your own is bad. Just saying that your argument is weak.

I think this is wrong. Magick works "the other way around" from science and medicine. Whereas those approaches assume a world of fact which we discover and utilise to find routes by which we can get what we want, magick involves creating such routes. Magick involves creating new facts-of-the-world. Which isn't to say that we can't reuse traditional rituals, but the reason they worked was because of the meaning attached to those rituals at the time. As that fades, the simple acts themselves have no inherent power. What are your reasons for suggesting that coming up with our own rituals is bad? Do you think that those who came before have some secret nature that we don't/can't access?

Q3: Yeah, you're missing the point.

Y'know, I did mistake what you said, because I was reading new posts having forgotten what OP actually said. My valid point is a valid response to... a point you probably weren't actually making.

POST: [discussion] mental illness and spirituality

Q1: I'm going to voice an alternative, controversial persepective. Maybe I'm full of shit... The "you" isn't pointed at anyone. I'm passionate about this topic and admittedly (melo)dramatic. Mental health, or any type of health, is something you have. It is not something you are. While everyone has different raw materials (experiences, genetics, etc.) we are constantly building our health. Nothing about health implies a stable and perpetual condition. Health is a dynamic and multifaceted system embedded in the larger system that is you. Does a lifetime smoker choose cancer? He probably didn't choose to smoke. His parents and friends smoked, and he only meant to smoke at parties initially. I'm calling bullshit. Read some stories about cancer survivors. How dare they rise above illness. How dare they choose to beat cancer and find happiness despite chemo or radiotherapy. Does a person choose mental illness? Honestly, it would be absurd to deny genetic tendencies are traumatic experiences, but who chooses what they do with these raw materials? How can a girl who was born to abusive and bipolar parents (who's parents were abusive and bipolar) break the chain? How does a rich kid with golden parents and golden and prime genetics end up paranoid and homeless after living the good life for 40 years? People know there depressed because they're sleeping all day or not sleeping at all. They're eating too much or not eating at all. They don't have a job or friends. They never exersise. But does this correlation imply causation? Or are they depressed because they don't have their shit together? They just need Prozac because because it's not their fault. How many people have been sold this lie? You don't know what's best for you because you don't have fancy letters infront of your name. If you aren't taking care of you body or your life, you're supposed to feel depressed. Ifyou go trough bouts of complaining, laziness, and bottling up your life you're supposed to explode with reciprocal mania. Are you going to be a victim? Life happens to you and there's nothing you can do about it? Or are you going to be a magician? You activavly participate in life and your own unfoldment? Just don't neglect the mundane stuff. Work. Family. Friends. Sleep. Diet. Self expression. Clean enviornment. It's all important.

Q2: I don´t see why this perspective could be controversial. In fact I mostly agree. The only thing I can slightly disagree is that, I my opinion, you don´t "choose" an illness but you "allow it".

Ah. Expand on "allowing"...?

Q2: Just as we allow things that are not entirely beneficial to us in our everyday life. There´s always someone or something that want´s something from us, who doesn´t have our best interests in mind. The first analogy that comes to my mind is being mugged. You could probably have avoided it by not walking into that dangerous neighborhood or by taking a cab or something, probably, maybe not. Once this person is demanding your money you can always run or do something. But you don´t, so you allow it to happen. Of course it´s harder to avoid as it escalates. This is related to illness that have episodes. A similar analogy for continuous illness could be blackmail. Don´t get me wrong, I don´t think it´s easy to avoid, or not allow, something like this. It´s just that things happen all the time, not doing something about it can have detrimental consequences to us. There´s always something to learn either way :)

Interesting. I was thinking you might mean "allowing" in the sense of perceiving that there was a possibility of something and, in addition, not taking the intuitive action to avoid that possibility. Combined, that would be creating (indirectly "selecting") the path by releasing into it. You make a good point about this also being true in a more grounded way. Not adjusting the pattern (habit, belief, trajectory) to avoid what you have realised the trajectory is heading towards.

Everything has to be true in a more grounded way...

Well, quite. There is only one "nature of things", otherwise it isn't the nature of things...

...

Commenter has maybe been round the studies-theories-claims-fade cycle a few times, correlation + simplistic model. Not to disparage the work, it's just the grand final claims. Remember when DNA was a "blueprint" and there was going to be a gene corresponding to every disease and personality trait and vulnerability? Ah, not quite so simple, it's more of a "platform" than a blueprint. Phrenology was once called "the only true science of mind" in the 1800s; in the early 1900s eugenics was seen as a medically and ethically sound approach to population management until the association with Nazi Germany scuppered it after WWII; Egan Moniz won the Nobel prize in 1949 for inventing the lobotomy; now we have "chemical imbalances"... Each was groundbreaking and a triumph of understanding at the time, and the result of thorough research and persuasive studies and theorising. These were not stupid people. We are not stupid people. But we are not any cleverer, and we are just as in love with our own Thinking Of The Day, on the lookout for a new "simple certainty", seeing the world through our Shiny New Metaphors. In 100 years time, this will all look ridiculous.

(But - if it's useful, we should use it of course. I'm just saying that historical evidence suggests we should keep it in perspective, particularly with no integrated model, more of a "promise".)

Rant over! :-)

POST: Astrology on other planets?

If the basis of astrology is the accessing of inner knowledge, then it wouldn't matter what approach he took, so long as it had some sort of formal structure and he arrived at it by contemplation?

Q: But what if inner knowledge is predicated on real relationships to the planets. All of my ancestors and relatives back to the origin of life on this planet lived and died under our moon and sun and neighbors. Fungi and plant amd other apes and bacteria and all. If we leave our home, do we lose the support of our cosmic family? I have no idea how to test this without blasting myself out of the solar system, but its a fascinating thought. What if our consciousness is dependent our system, and we will have to find new sources to derive our inner life from upon relocating?

An interesting thought. I'm inclined to say, though, that for the "inner knowledge" aspect the system of the planets is within consciousness - at all times. The entire universe is dissolved into the background of your awareness right now, in this room. The reason you think you are in the room is just because that particular aspect has been unfolded into sensory experience. All knowledge is present, now. That's a different thing to bodily support and experience, though, and physical dependence. It's easy to imagine that the state of the whole universe contributes to the events of a particular moment. Would we become... different... when out of our localised, consensus region? Hmm!

POST: Have you ever asked yourselves

Q1: No one ever did, I think: what a strange question, if you let me say so. Look at the Baal Shem Tov (all my love & gratitude upon his name): he knew that he knew a lot, and he knew he could perform wonders. And he was humble, knowing that he knew a lot... and then one day his dear wife died... ow, and you have to read that... Martin Buber. Go read it. EDIT: of course, I agree with the other comments too. I just wanted to express my surprise... You see a man who could do wonderful things & was absolutely enlightened & was taken aback when his wife died: he never knew he was going to feel what he felt.

Synchronistically, I came across this yesterday:

[POST]

DaVE's BaSeMeNT

There is a Zen story about a Zen Master and his Wife... Sometimes it happens: Masters achieve Samadhi after already committing themselves to life as a householder; some have married and fathered children before Attaining... This is the Story of the Master whose Wife became his Number One Disciple. The Master had become famous for the Depth of his Enlightenment in his 40s, after his children had grown and he and his Wife opened their home to any and all who would devote themselves to the Dharma. The Master taught while his Wife cooked and fed all who would come. For many years, students from many miles away came to study and be with this Dharma Master who espoused the Zen values of Emptiness and the Doctrine of Nothingness and the Ultimate Illusion of Temporal Reality. Over the long years an entire community developed around the Master and his Wife until he had 100s of disciples... One day after teaching for many many years, his Wife suddenly sickened. For a week the Master attended to her in her illness, forgoing his teaching and ignoring his disciples. His disciples began to whisper and speculate among themselves... "How will the Master cope with this? What if she dies? Will he hold to his Serenity? Will be keep the Dharma?" And then after a week of nursing her and caring for her, his Wife died quietly during the full moon in the middle of the night. The next morning the community was roused by a terrible racket and ruckus! All the disciples came running in great concern... And there, at the doorstep of his home, they found their Master--drunk!--sitting in the dirt, his clothes rent, his hair wild and loose, tears streaming down his face... He was banging with a ladle against an old iron pot and crying and wailing like a lost child. He was inconsolable. They knew that his Wife had died in the night... His disciples were shocked to see their Master displaying such emotion! Never had they seen him like this before! Some began to question the Master and even to berate him: "But Master! Did you not teach us that Life is an Illusion?" "Yes!" The Master continued to wail and beat his pot. "But Master! Did you not teach us that there is no Death?" "Yes!" He cried harder, still beating his pot. "But Master, did you not teach us that one day we all awaken in the Pure Land and dwell in Eternal Bliss?" "Yes!" Wailed the Master again, beating his pot even louder! His disciples were stunned... They shouted at him: "Then if what you have taught us is True why are you now drunk and crying and carrying on so?" The Master stopped long enough to look out among the disciples gathered round him. Through his disheveled hair he met the eyes of those nearest him... He said, still sobbing: "Because my Wife was my Number One Disciple. She taught by my side these many many years. I loved her! And now my Wife has died. And I shall miss her!" Contrary to the popular Myth, Zen does not spare us from Suffering. Zen does not eliminate difficult Emotions. In fact, Zen brings our Suffering and our Emotions into sharper clarity. You will feel them more immediately, without buffer. They will feel stronger! Despite the portrayals of Zen in Films and Television, Zen is not a tranquilizer! It is not a Pacifier. SO, if you have been attracted to Zen in the hopes of finding an end to Suffering then you should begin looking elsewhere. Zen will not save you... Zen makes your Life more Real; more Immediate, more Authentic. When you suffer you will be MORE aware of Suffering. When you are Compassionate you will suffer not only for yourself, but also for everyone you meet! YES, Zen will actually increase your Suffering. There is no doubt of that. But Zen will also help you survive it. And it is equally true that in time, Zen will also increase your Joy. With Zen you will cry harder and faster and you will laugh longer and deeper. Isn't that worth it? Enough for today... --Pahka Dave

[END OF POST]

Q1: Would you recommend me a book about this philosophy? Zen is my first layer of knowledge. On it I go from one master to the other. Castaneda & Baal Shem Tov being the main 2.

Cop-Out Response

Hmm. I'm not quite sure what to recommend these days, because my own take is a mix, and therefore what I'm about to say probably won't be quite what you are asking for! So I've added that below. :-)

The response of the students is that of our secrete hope that the world is magical and we can somehow avoid experience, in some mysterious way we will be spared. But that's not what Zen promises - Zen promises (apart from nothing at all) that we can see things clearly and directly. [1] Any philosophising that a tradition does is then patterns on top of that clear seeing, basically a vain attempt to convert it into ideas and language that can become guidance. Zen is, I think, the closest tradition to admitting that the experience is what counts, and that stopping interfering long enough to see the true nature of experience is the only lesson.

As I see it:

- Experiences leave traces which in-form subsequent experiences.

- Thinking is an experience also, and produced in-form-ation which affects subsequent experiences.
- You need to take time to let your attention open out into the background space in order to see what is behind/beyond the patterns.
- Only with this foundation can philosophies for living make sense and not be castles in the sky that are confused with cityscapes of a solid reality.

Reading Recommendations

So... I'm inclined to say we should put aside the thinking and go for two specific experiences, because otherwise we read and read and think-about and conceptualise forever - when this actually conceals our basic experience. Having had these, our personal philosophy will naturally follow.

- The first, is to have the experience of your body moving by itself, and allowing it to respond (not react) spontaneously. I recommend Missy Vineyard's How You Stand, You How Move, How You Live for this. It's says it's based on Alexander Technique, but actually she's had an insight[2] which leads to a different way of viewing it.
- The second experience is to directly experience yourself as the background awareness in which experience arises. For this, Rupert Spira's books Presence Vol I & II (sample here) and Greg Goode's Standing As Awareness (sample here) are excellent. This interview may also be of interest, as might this approach to dissolving yourself (do the non-assertive version daily).

Once we're on your way with those, we can mess about with any metaphors that take your fancy, while realising that they are just metaphors ("mind-formatting") - but that adopting metaphors affects (or "in-forms") the pattern of experience within our awareness.

[1] I personally think we can have a little more influence than that, as illustrated in the diagram and bullet points a little further down. We can... re-format. But if you do this without being stabilised as the background, you can get lost.

[2] The insight she has comes from realising the trick to direct, "allowing" perception is spatial awareness, and that this involves either detaching from or completely becoming the space in which your experience arises.

Zen is practice. Above all is practice. There's no knowledge, it's practice. I love it. There's nowhere to hide, ha!

Yes! Well, how can you escape from what you are made of? :-)

I'd say the English language isn't great on it - there is actually knowledge in Zen but it is direct knowing by being rather than the thinking-about knowledge that comes from conceptualising. Direct truth (you are this, this is how things are) vs conceptual truth (something that feels coherent). In Zen, we put aside the conceptualising and let the mind settle to reveal that, amongst other things, the world is not made of "parts". There is extra stuff though which can subsequently be gleaned from philosophy and experimentation: Zen is based on this world as it is and our ideal state for responding to it. If it is possible to tinker beyond this however you cannot experience yourself doing so because it is out-with the senses / behind your viewpoint. That's where the magick (literally) happens - that's where intention is.

EDIT: Although I'll say - it's practice as in, stopping interfering regularly. It's not something you get better at, so it's not practice in the sense of a skill. Although you can be more pro-active about resetting your experience if you choose to be of course.

You have to 'be' it. Incarnate it.

Although even that... you already are it. What you are is the "open aware space" which takes on the shape of experience. Doing some quiet sitting or an equivalent allows the transient conceptual noise to settle such that you are left with the longer-term patterns and habits. Gradually, those too settle, and you are left with something more direct. The background becomes clearer as you are no longer filtering experience with attention. And you see how things were all along. You can't get better at being what you are. If you are feeling confident, you can simple assert this to be true and get to the experience immediately. You really do have to step boldly and confidently though! I guess that's where talk of "faith" comes in. It's a fun dilemma!

Do you know Japanese, Chinese or Indian?

Unfortunately not. I've been to Japan and got some language going but these days all I can recall is "Hai" and "Oishii desu"...

POST: So I've been doing the first exercise in Undoing Yourself and got some unexpected results.

Also recommend the (free) Jack Willis book, Reichian Therapy: For Home Use [<https://autonomousterrace.wordpress.com/2014/07/01/jack-willis-reichian-therapy-the-technique-for-home-use/>]. Willis worked with Hyatt and his book is basically a more efficient and structured version of the Hyatt approach, without all the nonsense (fun though that is to read). I think there was some disagreement between Hyatt and Willis about ownership of the material at one point, circa New Falcon Press early days. But anyway, the book is worth checking out for 'another take' that is a bit less cavalier. It's also much clearer on the caution and staging one should take.

Q1: *TriumphantGeorge that link is fantastic. Would you by any chance know of a counterpart for Feldenkrais- or Hanna-style body work?*

Glad it's of use! :-)

On the bodywork front, after being through the various kinds, I'm down to recommending How You Stand, How You Move, How You Live by Missy Vineyard, because I think it (almost accidentally) gets to the heart of what it's actually all about - it's not quite the usual Alexander Technique really. When she discusses waiting and allowing movement to happen, she's basically writing the book I will never write. :-)

There are also a few good articles over at [learningmethods.com] (an offshoot of Alexander Technique), particularly one called Confessions of a Do-er. You might also find this post what I wrote interesting [Overwriting Yourself], if you read it bearing in mind that throughout it I am referring to our "perceptual, experiential space" and I've just adjusted the language for the theme of the subreddit. I really believe that overwriting yourself with open, attentive space (or switching perspective to "become the surrounding space" and "allowing"), then not interfering subsequently, is the way forward for The Big Results for a wide audience. Bodywork is really mind-work; the transformation or dissolution of persistent perceptual patterns in the space you perceive around and within you. In short: The trick is to realise that you are basically only ever experiencing your 'mind-space' and your body responds to that; clearing out that space is the secret to improvement.

EDIT: I also really like Andre Bernard's book, Ideokinesis. It's the one that made me think about body and movement in a different way. There, that's all that off my chest.

...

Journal over your week break, like when ever you can and esp when you don't feel like it.

Did you really just suggest he uses ESP when he doesn't feel like journaling? People here are more advanced than I thought! ;-)

POST: People who have prescient dreams: have you ever been able to change what actually ends up happening?

You might be interested in reading Ian Wilson's Theory of Precognitive Dreams [https://web.archive.org/web/20160213215851/http://www.youaredreaming.org/assets/pdf/Theory_Of_Precognitive_Dreams.pdf]. In it, as well as theorising, he has examples of having had lucid precognitive dreams and making changes in the dream that later came true. It seems to me that he edited the moment before it arose. My theory, then:

- Your timeline is already set out. You are simply traversing it, unfolding it into sensory experience moment by moment.
- However, that doesn't mean it can't be changed.
- Any moment we are experiencing, we can interfere with via action. However, present moment actions don't necessarily affect the future very much unless they are accompanied by the intention to do so. Doing this - an action accompanied by an intention towards a result - you should be able to have some effect.

- In a precognitive dream though, you are actually directly experiencing that moment as it will arise in the future. Therefore, you can interact with the moment and change it, while in the dream! This direct interaction with the moment will be far more effective than performing actions in days prior to this moment.

Which suggests an powerful approach for derailing the outcome once you've had the dream, because if you don't happen to be lucid during the precognitive dream, you could still access it later. Settling down and relaxingdeeply, disconnect from the surrounding time, and "ask/summon" (not deliberately generate) the moment in question back into awareness...

All time is available here and now; it is dissolved into the background of the experience you are having as you read this.

POST: How does one eat a servitor/egregore/sigil?

A1: With some fava beans and a nice chianti?

I wonder how many other people had that as their first thought when they saw the title? You should have added "First!"

POST: Trying the quarter experiment from Prometheus Rising with no success. Help!

This is highly dependent on people dropping change (and not bothering to pick it up).

From a "magickal" worldview, the people dropping stuff is part of the intention and takes care of itself (the plausible story for why the coin is there doesn't matter). From a "perception and attention" worldview, all you're doing is programming your attention to be on the lookout and spot what is already there. Thing is, you can't tell the difference between the two.

While living in England I had no luck with this experiment either. Never found a single quarter...

Sure you did...

...it's just that things don't always play out literally with magick on da street.

What is your visualization technique? How are you charging the sigils?

Curious: When you visualise yourself walking down the street, are you seeing you from outside, or are you looking out of your eyes? Do you imagine that you are feeling happy, or do you actually feel the happiness? When you are later walking about, are you deliberately keeping an eye out, checking if it's working, or have you let go and are allowing the world to "come to you"?

Q1: I visualize myself from a third-person point of view. I try to actually feel the happiness to the best of my ability. I also am on the look out. I've been going on walks specifically for this experiment. You know, the whole "buy the ticket, take the ride" thing. I walk through parking lots to get various buildings, but other than that I very rarely walk on paved roads. And for the first part of the experiment RAW instructs to continue to visualize yourself finding quarter as you walk. So, that's what I've been trying to do.

What you did is the natural instinct and you're spot on about generating the feeling. But you will have much better success if you think of it a bit differently: think of it as "programming an experience into the world". Like you were inserting future moments into the timeline of the universe. So, what experience are you wanting? Well, of walking along a path and seeing a coin and feeling excited and picking it up and enjoying the event. This experience will take place in the 1st person, so imagine it in the 1st person as if you were actually having the experience. Another good practice is to summon the feeling of knowing-for-certain that something is going to happen. Doing this, you can let the experience come to you. It's a bit like the Neville Goddard approach of "summoning the feeling of the wish fulfilled" - producing the experience you're going to have internally so that it emerges externally. Focusing on producing the feeling in the 1st person is the important bit.

...

So if a person is raped, it's because they believed it would happen?

He didn't say that, surely you know this? There's a difference between believing something will happen and believing that something is possible (or having beliefs that leave the door open to it happening). OP is supposedly intending to find the quarter. If that intention doesn't work out, then according to the perspective of magick thaats because didn't truly believe and expect - ie. feel-know - it would happen. Meanwhile, nobody (hopefully) intends to get raped. It is within the range of possible events of course - otherwise it would not happen at all, by definition - but it is not an actively-selected event. In other words, it is not the victim's fault. What the commenter is getting at is that magick is about creating specific facts. So if something you are specifically targeting doesn't work out, it's because you failed to create the fact. It is always the mage's fault (if you go with this). The opposite of the situation in science:

In Science the theories are imperfect, and are constantly being revised. In Magic, however, they are perfect and untouchable. On the other hand, in Science it is assumed that the operator (ie the Scientist) is perfect whereas in Magic the operator is imperfect and himself in need of improvement.
-- SSOTBME: An Essay on Magic, Ramsay Dukes

Sorry for the mini-rant but the whole "bad things happen because you made them happen" comes up now and again... :-)

His point was more subtle, I think. And if it wasn't, then it should have been - because the underlying idea doesn't say what you are suggesting it does: people are responsible for the bad things that happen to them. I'm sure you wouldn't disagree, though, that people can - within the bounds of their knowledge - take action to minimise the probability of a bad thing happening?

Fine let me rephrase. If you get raped it's because you didn't believe you were rape proof. Believe hard enough and you are completely safe.

Is it your fault if you get shot by a gunman in the street, because you didn't wear a bullet proof vest?

Perhaps there are magickal approaches which can insulate you from particular events. Is it your "fault" if you don't know about them, or if you do don't enact them "just in case"? No. "Fault" implies a direct causality between an action and inaction and a future event. That doesn't apply here. Not wearing a bullet-proof vest does not cause you to get shot; not adopting a particular belief does not cause you to get physically abused.

Btw science does not involve assuming a scientist is perfect, it's cute that you think that.

That's not what the quote is getting at. It's contrasting the two worldviews:

- Science is about refining a theory to match observations which are assumed to be observer-independent. In other words the operator is not, by his disposition, affecting the observation. If the results aren't as expected, it is the theory that is at fault (and needs to be amended). It's in this sense that the operator, the scientist, is "perfect". His internal commitment is not seen as affecting the outcome.
- Magick, in contrast, is all about the operator and the extent to which he has adopted, aligned himself with, a particular theory. If the results aren't as expected, it is the operator's alignment that is at fault (and needs to be amended). His internal commitment does affect the outcome.

If the theories of magic were perfect, they would never change or have different methods.

That's like saying that if the theory of Newtonian mechanics was perfect, every sports player would hit his target, 100% of the time. Now potentially, if a sportsman could align his mind perfectly to the structure of his body, then perhaps he could. Magick is like aligning your mind to a structure, a conceptual framework, you have arbitrarily chosen. You get to "choose your body" and then try and align with it. In other words: The basis of magick is that it doesn't really have a particular causal framework underlying it, but if you are working with a specific framework, then you have to commit to it and abide by its (arbitrary) rules.

You are just arrogant if you believe your way of thinking is perfect, and even more arrogant for assigning your attitude to science when science isn't the system claiming to be perfect.

I think I've cleared up the science thing, right?

And thinking, or a conceptual framework, just is what it is. Perfect relative to what? If it gets results, then it is "right" within its context. It's not a personal thing; you can't be arrogant about such a self-evident principle - i.e. that what works, works, and if something doesn't work, you make a change. The difference between magick and science is, they have a different view about where that change needs to be made.

People doing things to change their odds is not the same as saying that believing you are safe makes you safe.

"Changing your odds" is only a particular type of magick, one using a conceptual framework based on the idea of probabilities. This is quite a recent thing, when people tried to make it more "science-y" and minimise the "miraculous". Other forms of magick don't bind themselves to that sort of structure.

It's not required or even recommended that you assume a person is perfect or that you are not affecting the experiment.

You don't seem to have understood what I said: here, "perfect" is meant in the sense of being a "perfect observer", whose attitudes don't interfere with the results. And physics, for instance, does indeed assume that the attitudes and beliefs of the operator has no effect on the outcome of an experiment. They are "perfect" in the same way we assume that a sphere is a "perfect sphere" and so on - "theoretically ideal".

(Of course, we factor in the possibility of cognitive bias and so on, and are careful with our statistical methods, but that's a different issue. That's not direct influence via imagination, say.)

That's what I mean by you running your ignorant fucking mouth like every other leach who bashes science because they think it's evil skepticism.

I'm not bashing science at all (I used to be in the business). It's a great way to build up observations of the most common stable habits of the world and connect them with concepts, to build theories which let us make reliable predictions and develop technologies. I'm just describing its approach and contrasting it with the approach magick takes. The two things aren't in opposition; there's no competition. Physics, say, deals with "observable regularities", magick deals with the other stuff, both are a subset of human perception and thought (however that works).

Keep defending him. You have proven that you run your mouth about shit you don't understand like every other brain dead privileged piece of shit.

That's not a very nice way to talk. Is that how you usually approach getting your point across? You've basically read into the comment what you wanted to read, so that you could go all emotional on some straw-man argument that nobody was making, revealing your ignorance of science, magick, logic and humanity along the way. A reasonable person, in your position, would PM him and apologise for their behaviour, and admit you were just venting. The alternative is that you really are like the person you are coming across as - which would be horrific if true, so I'm sure it isn't the case, right?

"Physics" doesn't assume anything.

Of course it does. It has some fundamental assumptions - the main ones being "the world is made of parts" and "change occurs via direct interaction between parts" - and then layers of the stuff behind every experiment.

Are you just going to make shit up to defend a guy who has a holocaust pun as a username?

I'm not defending the guy really, although I think your language is well out of order. This started because you trotted out the old "this viewpoint means that rape victims are to blame for their abuse" trope, when it really doesn't. There is definitely a good discussion to be had on the underlying idea of "to what extent does belief influence experience, and in what way", but by jumping to an emotive and extreme position, you make that impossible.

Yes this is who I am. Horrible I know. It's your fault for believing I would say those things.

That's a nice line! But it's more accurate to say: My worldview allows for the possibility of aggressive, swearsy redditors to wind me up using straw-men arguments and confused reasoning. ;-)

Anyway, I gotta say that I think the word "belief" is misleading and pretty useless when talking about this stuff. The word "belief" in everyday life is used as if it means "when I think about it I kinda think this is true", whereas in magick it's more like "I feel-know this actually is true". It's a total certainty, a definite expectation, not an opinion or a viewpoint.

Q2: That's an assumption possibly made by physicists and even then it's an over simplification. Physics itself makes no assumptions just like my shoe makes n-

Hi, I don't think this is going anywhere useful, although I think it could have (because you brought up a couple of interesting angles along the way, in among the abuse). I wasn't defending the guy really, it was the position I was defending. I see it's all got very messy while I've been away though! Let's just wrap it up now, yeah? Take it easy.

Q2: Saying you didn't defend him doesn't mak-

I guess it's just my tough gig, always seeing the best in everyone! ;-)

Should we blame people when the placebo effect doesn't... have an effect?

No, we shouldn't. That was my point, remember?

My take on our commenter was that he was being flippant and jokey while you went straight into serious reactive mode with a pretty sweeping statement that misrepresents the idea behind this. Which quickly turned into some big exchange. After all, OP was about finding coins...

Anyway - how do you think it works? The relationship between belief and magick?

I didn't believe my first sigils would work yet I got some bizarre effects. Doesn't seem like that should happen if it was purely belief.

Right, that's why maybe "belief" isn't a great word for this. In this usage, it's actually more like "not getting in the way". It's probably become a bit confused because, if you really believe something then you won't obstruct it, and that is necessary for magick. But it isn't the belief that's causing the magick; it's just that believing means you don't interfere with the process by blocking it. But this is where another confusion comes in - because again, "believing" and "knowing" get mixed up as the name for that sensation. A further twist is that people confuse "believing" with their "intending".

If I had to guess why magic works, I think a trance state brings the person to a place where they can project a pure mental concept for the aether to latch onto or fall into the form of.

Yeah. I think of it as accessing the facts-of-the-world, which are always available if you quieten down, and making changes by intention. When you do that fully, you know that it's a fact. Magick is better described, maybe:

- Intending an outcome = adjusting the "future facts" of the world = "knowing" the event will occur

(This being achieved while being in a state where your attention is deeper and expanded into the background of experience, rather than focussed on the present moment sensory experience.)

I always tried putting myself in the present rather than the past or future...

I've been experimenting thinking about it a particular way, just as a metaphor to work with. (Actually there's two, this and another one based on updating "facts", but they're kinda the same.) See what you think:

Think of your whole timeline, all moments, as already existing. It is always there, sort of dissolved into the background of the experience you're having now. The current experience is just one moment, sort of "unpacked into your senses". If you don't interfere at all, you'll experience one moment after the other, just as it is on the timeline. However, by applying intention you can change the contents of a particular moment. If you make a change to the moment you are experiencing, you call it just "doing stuff". If you make a change to another moment, that's "magick". When you quieten down, you are getting more in touch with the full timeline. All intentions always have an effect on the entire timeline, but the more connected you are to the background timeline in the same way you experience the present, the stronger the effect will be, and the easier change will come. Beliefs which oppose the change, or any attempt to force an update, will get in the way of you intentions re-shaping the timeline contents.

Does that makes sense? The conclusion is then:

- The world is like a memory, a world timeline containing all moments.
- An experience is like accessing a particular moment with the attention and the senses.
- Magick is about updating a particular moment, at which point the whole world timeline falls into line.
- Importantly: Your personal memory can be different from the world timeline, because the world timeline cannot "remember" what it used to be like before it was updated.

Q2: That's an interesting way to see it. Our perceptions seem just as flawed as our memories so it makes sense to kind of rework the time line to adjust things. Your practice sounds similar to how Dr . Manhattan perceives time. The future is in a sense already happening or happened but there are an infinite number of futures for every possible change made here in the present. Change the course of the puck slightly from the other end of the field rather than having to change it's path massively right before it hits the goal. I've been thinking of the future in a new way. I imagine a constantly changing potential future being massively effected by any choice made in the present. If you want to imagine yourself big and strong in the future, take working out seriously in the present. So many of us do the opposite. We lazily do the bare minimum at a job we hare while imagining a better future instead of working hard to make that future more likely.

Interesting comparison with the Dr Manhattan view! And you're right it's similar (all possibilities are available). Hopefully doing this won't affect my skin colour...

I'm taking the approach these days that any metaphor can be used, because there is no genuine underlying solidity to experience, just patterns (albeit stable patterns that let us exist). So apart from "editing moments of a timeline", I also view it as editing more general facts of the world. There's an old Philip K Dick short story called The Electric Ant where - SPOILERS - a guy discovers he has a 'reality tape' inside him which controls his experience. He edits the tape to see what happens. Which is a way of visualising what we are trying to do when using magick: edit the facts of experience.

I imagine a constantly changing potential future being massively effected by any choice made in the present.

Right, like holding onto the end of a stick and making a slight movement, the other end swing widely; time's passage is a multiplier.

So many of us do the opposite.

Yes, I think we fail to fully commit! You can't just do nothing. At the very least, you have to be focused. The focus can be more important than the actual action. (Even in general life, without intention activity doesn't built up to produce results.)

It's possible to generate amazing results which are just incredibly unlikely and without struggle, but you have to create a "reason" for them to happen. It is usually very hard for people to get strong effects if they haven't provided some route for the result to be "explained away". That's where "coincidences" come in.

... the easiest path may involve tragedy.

Good point - I think you can have almost anything happen, but if you don't specify the route you can't tell the impact. Looping back: it can take any route you would accept as plausible. Which is why people add a "no harm" bit to their workings I guess.

Fire is like a time virus that spreads through the physical world.

That's a really nice bit of imagery! It has time as a "thing" - an element and a pattern in its own right, rather than just a dimension - and so other "elements" can affect it. It's amazing how imagery like that is so much more vivid than most concepts or theories. There's something "alive" about seeing the world in those ways. (Which I think makes it quite a powerful thing in magick.)

Q2: I agree. Saying "time is relative" held no meaning for me until I got a visual representation of time and space. I wonder about tempature. If fire is extreme time, does heat and cold affect time? Silly question I know, a cold clock probably moves like a warm one but cold tends to slow down particles while heat speeds them up and allows change to happen more quickly.

Well, it's not so daft when you put it like that. If time is change, and change is identified by comparing one movement to another, then a hot clock really is faster than a slow one. What matters is which one you choose as your "standard time measure". Just like how the standard kilogram measure is defined as the mass of the international prototype [\[https://en.wikipedia.org/wiki/Kilogram#International_prototype_kilogram\]](https://en.wikipedia.org/wiki/Kilogram#International_prototype_kilogram). It's the relative mass as compared with this that matters in measurement, rather than the absolute mass of this object.

[QUOTE]

Kilogram

The kilogram (also spelled kilogramme) is the base unit of mass in the International System of Units (SI), equal to one thousand grams. It has the unit symbol kg. The word "kilogram" is formed from the combination of the metric prefix kilo- (meaning one thousand) and gram; it is colloquially shortened to "kilo" (plural "kilos").

[END OF QUOTE]

Q2: I didn't know that about the kilogram, that's pretty weird. I guess I never tried sticking a clock in the freezer and leaving another one in the sun or anything but now I am curious. Who knows, I'm sure whoever first thought to try putting an atomic clock in space and keeping one on the ground was a completely nutty idea. If anything mine is less nuts because it doesn't require massive amounts of money and risk of human life. I would need an atomic clock though, or whatever it was.

I think probably an atomic clock wouldn't be changed, because the effect it relies upon is below the level of "particles" - it depends on atoms decaying from one state to another, whereas temperature is (loosely) movement of atoms as a whole. But as a way of illustrating the point, having two mechanical clocks or watches, synchronising them, and putting one in a (dry) freezer and the other somewhere warm - and then the are different times one hour later, is its own type of crazy. If someone from "olden times" saw that, they would think it was magic and that one had lost time or whatever. Like the (probably) urban myth about people rioting when Britain did its calendar switch in the 1700s. I suppose a broader point is that you are your standard measure of things that happen. You experience things by comparing them to yourself (your own sense of time, hot, cold, all that - even moods or emotions). Which is a bit like George Berkeley's idealism where everything appears in your mind and so is relative to it.

Q2: That's an interesting point. The whole idea of personal perception of time is a whole new field of possibility.

Right, we think about time theoretically and discuss it, but we tend to not really ponder it as an experience. I actually think that the 'little theories' we adopt about things, intentionally or not, do directly influence our perception. Which is really a form of magick of course - adopting a new way of thinking about things, and then seeing that it changes your daily life.

Q2: That's like what Jadon Louv said on the Duncan Trussel show. Don't try to change the waterdrops, change the fountainhead. By changing ourselves we change our perceptions, actions, then reality. It starts with a trance, kind of like the word transformation (phonetically) which seems to have the steps to performing the act within the word. Enter a trance, put your thoughts, beliefs, or whatever is "you" into a new formation.

That's a nice observation, on "transformation". Reminds me of this good book with a terrible cover.

Trance-Formations: Neuro-Linguistic Programming and the Structure of Hypnosis

Q2: I may have to check that out. I love the neuro linguistics stuff.

Right, if you are then that's probably worth your while. The later stuff is pretty compromised, being pseudo-marketing after the originators, Bandler and Grinder, split and Bandler took over the NLP name. The best is the early stuff on Milton Erickson's hypnosis techniques. Check out Patterns Vol I. (They never did make a Patterns II as far as I know.)

Q2: Oh wow, thanks. Love the free ebooks right now since I'm broke.

This one's really good.

Q2: Can't wait. Still need to finish liber null and initiation into hermetics.

Good also. Final recommendation since I've just been rereading it: SSOTBME: An Essay on Magic by Ramsay Dukes. It predates the Chaos Magick stuff, and is basically the foundation that kick-started the late-20th wave of magick.

POST: [deleted by user]

The format of your mind dictates, shapes or is, the format of your experiences. If you just accept "reality" then what you're really doing is accepting the current state of your mind. Is the current state of your mind particularly special, holy, is it the ultimate state to be left as it is? Surely not. It's accidental. You didn't consciously choose it; you bumped into it most likely. The two ways to reformat your mind are (kinda the same thing):

- **Indirect** - Perform actions which result in experiences which leave traces in your mind, leading got more of the same form of experiences (events, actions and thoughts).
- **Direct** - Use your imagination to leave traces in your mind, leading to more of the same form of experiences (events, actions and thoughts).

So to a minor extent, you are always using magick anyway, because that's how mind-world works. Your choice isn't whether to use it or not, your choice is whether to do so knowingly. Beliefs, meanwhile, are just ingrained patterns or channels in mind. They are not an "illusion" they are just not independently true of the present format of mind.

POST: OK I'm a Cliche, but how to find "it", that "proof" of the occult whether physical, mental, spiritual!

You know, I'm still actually not sure what you're after here?

...Well, it doesn't work like that. This isn't physics - where you look for observed regularities and construct a theory. It's the mind, observed by the mind, as formed by the mind. Any viewpoint that you commit to will start to shape your experience into that form, passively. It'll just happen. If you don't commit to any one outlook, that won't happen. You'll get glimmers of "alignment" wherever you seek. If you start thinking of the world in a certain way and fully absorb that, you'll start to experience the world in that way. And it will be impossible to say whether that is how the world "really, really works" because: a) you have no access to an external, causal reality, meaning: b) there is effectively no such thing. Your "world" is the regularities of your experience. Your experience is made from mind. The format of your mind therefore in-forms your experiences. Looking for proof is like looking for your eyes. There is no external to your experience.

TL;DR: You will be wandering aimlessly until you commit to a particular worldview - i.e. adopt a particular mind format - kinda by definition.

POST: Help with Visualization

I think...

For most magick, it doesn't necessarily matter that you literally 'see' something; visualisation is more about summoning the 'experience' = the feeling of it. Maybe you're just not that visual; it won't necessarily inhibit your success.

- Visualisation $\neq$ literally seeing

Conceptualising with feeling will work, so long as it's the conceptualisation of something being present, now. If you do want to see things though, try switching from trying to make the image happen, to asking and receiving. Just as you 'receive' the image of the room around you, 'receive' the pink elephant. It's also worth noting where you are letting your attention sit - where you are 'looking out from'. Being too far back or forward in your head space can mean you tend to think-about or force more than you should. (See here [<http://www.reptilianagenda.com/brain/br121804d.shtml>].) That'll help you go into 'receiving mode'.

That link is really interesting being that I have poor eyesight for things far away (I think it's called myopia) and I also have double vision (although I can sorta control it). I think I'm pretty much mostly in my head so I'll work on changing that. Thanks for the advice!

Great. It does work - you'll find you kinda feel yourself "expand out" into the world again, like a perspective change. You might resist it a little at first though (sometimes there's a reason you went 'into your head' in the first place) but then it's okay. Good luck!

POST: Stuart Hameroff explains his position on consciousness.

My best-attempt transcript:

But let's talk about Freud's drives, id, dreams, all that stuff. I think all that's embedded in memory and manifests as quantum information. In fact I think dreams are quantum information - and I've written a paper about that. You know, dreams: time is all screwed up, there's really no flow of time. You have multiple coexisting possibilities; the logic is backwards. There's all kinds of bizarre things in dreams, which match very much quantum information. So I think the subconscious in the Freudian sense is quantum information that hasn't reached collapse. If it reaches collapse you have a conscious moment. So there's all this stuff going on at the quantum level in the brain that may not reach consciousness but is still actually influencing our actions in ways that we don't appreciate or are very subtle.

It's actually pretty hard to extract a transcript that keeps the sense of meaning and tone while skipping out the "blurs" and mis-vocalisations, but I think that captures it. I think you pretty much nailed the meaning in your little edit?

I appreciate this thread of conversation, but I'm not sure why it's necessary to delve into this one statement so deeply.

Actually, I just transcribed that as an exercise in a bored moment. The point about traces informing the direction of experience is key though, archetypes on olden-speak, and joins dream-like and waking-type experience. Occult partitioners needn't rely on repeatable science, but I think that metaphysics can be fundamentally useful + personal investigation (such as this [<https://batgap.com/ruPERT-spira-2nd-interview/>], for a good recent example). Anything that can help built the 3rd-person to 1st-person bridge is a good development, I think.

EDIT: I'll add that it seems obvious to me that the brain/mind (3rd person/1st person view) does not compute. It is entirely memory-based. Experiences arise, traces are left, patterns are activated, deepening those patterns, in-forming the shape of subsequent experiences, and so on. Furthermore, I don't believe consciousness "arises" from anything. Patterns of experience or "self" awareness (awareness-of) may take the form of folds and ripples, say, but awareness itself is fundamental.

POST: Does reading other people's theory matter when working on chaos magick?

No, unless you have absorbed and believed them. Your assumptions will limit the routes by which your results can occur. Use anything you like for inspiration, but they don't "matter" in a more general sense.

Art is theft.

While thieving is an art. Oh, conundrum!

POST: Why should I give a damn?

Q1: Why are you interested in occult topics?

Q2: Simply put I wish to create my own utopia. I want a world unto myself where I can live in omnipotence and freedom. I dont want to be absorbed into a collective Hive mind where I am merely a cog in the machine. Im interested in iccult because it seems to be the best way to achieve my ends.

Sounds more like a job for lucid dreaming universes [<http://www.dreamviews.com/dream-control/46571-infinite-universes-lucid-dreaming.html>].

But I don't think you are a cog in a machine, part of a hive mind. That's not where this ends up. Where it goes is: You realise you're not really a person, you are just experiencing through a particular perspective. Your thoughts and body sensations aren't yours, you are beyond that. Basically, a confusion gets cleared up. You don't kill the ego, you just realise that it amounts to a bunch of thoughts and nothing much else. You're still "you", but now you know what "you" really is. You don't get absorbed and dissolved; you just "get it". It's like you've been looking at a photograph of someone, mistaking the image for yourself. Suddenly you realise that it's just a picture, and that you're not that person after all! The photograph doesn't dissolve or burn, it's still there whenever you want it.

TL;DR: You don't have a choice. You already are this "higher self" or whatever you want to call it. Just like watching a film about WW2 tank commanders doesn't mean you stop being some bloke in a movie theatre, no matter how absorbed and lost in the story you become.

Q2: Im ok with being A god but not so much being God. If all I am is a part of one beings clockwork then id rather not exist. As for infinite power last I checked I couldnt shoot lightning from my fingers.

OP wants to become a cancer in God's infinite body.

Q2: Nay i wish to be entirely seprate from god. I do not seek to fight it or killit i seek to exist outside of it.

That's gonna be tricky, if it turns out to be you or inside you. God is not a "thing".

Q2: Lets break this down simply. I have a one complete and total purpose in life. To be free and independent. God is an obstacle to that goal. I seek a way to overcome that obstacle. If I cannot then my purpose is meaningless therefore I am meaningless. My only true goal is freedom and Independence. Having nothing control me except me and I will attempt to do this by any means. If this means becoming a cancer then i will become a cancer. If it means I have to kill god then thats what I will do. I would rather.not exist than be a mere part of something else. I have no interest in my "true self" for I am my ego. The Ego is me. If the Ego dies so do I.

To be free and independent.

Of what? To do what?

Your "Ego" is just a bunch of thoughts which appear from time to time. You are no more "the Ego" than you are the memory of last night's dinner. So no need to worry about

that. This whole "God" thing is nothing to worry about either - assuming you don't really believe in a "Sky Fairy" that can wield some sort of influence over you, or some other entity that's sort-of-like-a-person but more powerful than everyone else.

Having nothing control me except me and I will attempt to do this by any means.

Sounds good. So, the "Ego" and "God" aren't a problem. Which means that, provided you're happy operating within the confines of the character traits you've arbitrarily (but transparently) inherited by birth, upbringing, culture, the larger environment and the human experience - you're all set!

Q2: its not a matter of I wish to rule this world. That isnt my wish at all. I want nothing to do with God I find him to be an asshole from what I have read. I want my own place. A place where I have omnipotence not to rule people but to be blissfully independent.

The problem is, you can't get away from "him", because it's not the Biblical God (as an "entity") you have to deal with. What you're stuck with, is realising you can never be independent because you are a fragment of the world: you are from it and made of it. To ask to be independent from it is like saying you want to be independent form oxygen and food and sunlight. It's what you're made from. In fact, it's worse than being a fragment of the world - eventually you realise that the world is sort of "inside you". Wanting to be independent of it is like wanting to scoop out your own lungs so you don't have to put up with that annoying "inhalation" sound anymore. Overall, you might find that it's better to examine your breathing technique instead.

...

Once you've projected swinehood onto someone, your furious attempts to get them to appreciate your oh so pretty pearls of wisdom are both vain and self debasing.

Saved!

POST: Ask r/occult: What are your powers/ gifts/ talents when it comes to the occult. What is your area of expertise?

Q1: I have none, does that make me weak? Doubtless the spiritual lightning bolts you can probably shoot from your hands would overwhelm me.

Q2: No it makes you realistic. You don't have to summon "demons" to be an occultist; you just have to slowly but surely be finding your own code of honor and living by it, hard as that might be.

Okay, but getting stuff done, or direct understanding, is surely the driver?

Q3: I am 5 years into advanced spirituality and one of the most important lessons which has been given to me is not to brag in public about my gifts. I certainly thought this was a universal understanding after the trials and tribulations one faces through the narrow road to freedom and liberation. If you can talk about it with no backlash; cool.

The law of silence. There is an issue with "conceptual momentum", where being in the company of people who actively doubt you seems to have an effect (but perhaps simply by seeding doubt within yourself).

Q4: I think it also has a lot to do with Irony.

Want to expand on that?

Q4: Not really. :)

Oh the irony. ;-)

...

...only to come back with an answer that transcends what I understand about the subject.

That's completely how it seems to work. Pose the question, set the goal, let the mind (and world) get on with it on your behalf - the answer comes back to you when it's ready. The more you try and force a route by which the solution appears - say, by making the answer come to you step by step via logical thinking, or demanding that it has to be a voice in your head rather than a rare TV show repeat you come across while channel-surfing - the longer the timeframe or more limited the return.

POST: Stories of Sexual Conquest via Magick

A1: I've used a glamour before. It works very well, and doesn't require conscious will. How long it lasts seems arbitrary though. I had one last a day, and then I've had the current one on for. . . I don't even remember. Point is, even if the spell doesn't work, it doesn't backfire. Total confidence booster.
Edit: To be clear, I didn't use this to get laid. I just used it to talk to girls when I was younger, because I was impossibly shy, and it was a massive confidence boost. Now, it's just kind a fun to work with this kind of magick.

Q1: Never heard of this can you elaborate/share more info?

A1: Never heard of a glamour? It's a spell to change, or hide your appearance. It's one of the oldest techniques out there, and "Galmour" is one of the oldest words for it. It's where we get the word Glamor, and Glamorous, in modern English. There are a few videos on youtube about them, and I'm sure you can find articles about it. Basically anything calling itself a "beauty spell," is probably a glamour. It makes you appear more attractive to people.

Hmm. Are you summoning the 'feeling of being attractive' and radiating it out, expanding yourself out - or is it something else more specific (as in, actually projecting an image). Does it require maintenance?

Not that I need it of course! ;-)

Actually, I think I've probably unwittingly harnessed something like this my whole life. Being deliberately present and expanding to become the background space/structure of the room in all directions.

A1: Sort of imagine it as. . . You know the feeling you get when you're wearing a really nice set of clothes? You get that feeling, and the confidence that goes with it, but more than that, you sort of generate this aura that makes you appear like someone who would be fun, and awesome to hang out with. You generate the subconscious signals that you might not normally put off.

Nice phrasing. "Summon the feeling", maybe? Something that's used in other approaches for other things.

A2: Cast to have sex with a specific girl. We had sex twice. Then she moved to another state and decided to adopt a male gender identity. Cast for a specific girl to fall in love with me. She did. Hard. I felt bad and cast for her to be free to make up her own mind. The next day she texted me and apologized saying she just met someone she thought she was going to marry and that we were only going to be friends. There are a few others, but those are the most noteworthy.

I love that: AesirAnatman, the love he has is so strong it turns girls into men!

Seduction is a game. Magick is violating free will so I would consider it like cheating, having an unfair advantage.

Is it violating free will? Is there not implied consent?

If someone cast a love spell on you and you hooked up with that person and then later you realized that you hate that person does that make your consent implied?

It was a question rather than an assertion. Basically, can you make me attracted to someone when I'm really not and never would be? If it works is it not by my implicit agreement by "me" or "my subconscious"? Can you really make me do something against my will?

I would say yes to that

I guess the core of my thinking is in that word: "receptive". If it's "receptive" as in being open to the suggestions that are being made (not having a problem with it) then it isn't a violation. It might be against your "will" but not against your "True Will". If it's "receptive" as in being vulnerable, then it's a problem. Practically speaking I suppose it's easy to dodge all this and include an "only if it is appropriate for the target" type clause in your spell. Because it's never going to turn out well otherwise anyway.

Well I worded it the way I did because I do know how to wipe memory and that opens up all kinds of horrible possibilities. I only tried it as proof of concept. The better I got at hypnosis the more it scared me how powerful it is.

Ah, got you. Well, I suppose it reveals how "imaginary" our worlds are. There maybe isn't a solid underlying behind anyone's experience, it's really all hypnosis and self-hypnosis. Autohypnosis was the first "magickal" thing I experimented with. It's only fairly recently that it occurred to me that it (along with dreams) is really fundamental rather than just a curiosity or a means to an end.

I believe magick to be mostly hypnosis.

Agreed. Or "whatever magick is and whatever hypnosis is have the same root", perhaps. My current little model - (indulge me! it's coffee-and-typing time on a Friday afternoon! other views appreciated!) - is that experiences leave traces, and traces inform subsequent experiences. Traces are "archetypes" or "enfolded forms" which structure the "unfolded objects" of our ongoing experience. Hypnosis and magick are the means by which we can change the "enfolded forms" directly. Our subsequent unfolded experience will then be aligned to the change.

You might call it "inserting new facts" into your world. We all have the power to do this, to ourselves and others, but most of us spend our time pissing around, looking at and trying to interact with the transparent mirages of passing unfolded objects, and never actually intend change at the level of traces/habits/beliefs. In fact, it's not a "power". Just making a decision that something is true, while getting out the way and not resisting the update, is enough. A hypnotic trace is simply a state of "not resisting the update". As is gnosis. As is faith. Amazing things can be done. But the further you want to deviate from the 'habits of the world', the more you have to let go of it - which, counterintuitively, means putting less and less effort into getting the result. Also, retaining a memory of what's happened can be a challenge - "narrative coherence" is Rule No. 1.

who or what demans narrative coherence

I think that - the story should be consistent - and persistence of the environment are the two structural foundations of perception. We basically build up habits, and focus on things that correspond to those habits. Anything else makes us feel uncomfortable - or maybe more, the mind strives to slot our experiences into those familiar channels. Probably by dissolving some of the habitual structure, or at least preparing the way for a discontinuity, it could be made easier. Or something like that! :-)

Q2: *the story should be consistent*
Says who? :)

Says "habits of mind"!

It needn't be, other than that. Although a bit of Reich sounds appealing.

Q2: *It's more the bodily-emotional system that is easy to condition. The mind often entertains possibilities, but the somato-affective apparatus has great inertia.*

I've quite liked Alexander Lowen's take on his stuff, and the Jack Willis book was interesting, but I've really not done much with it. I've been more "direct overwriting" as an approach.

...

Q3: *Thanks but it's too late for me. I'm 23, never had sex (or even a kiss) and I'm extremely paranoid, partly because of people like that. I know it's not fair, but I don't trust women after the shit I have seen some do and the kind of stuff many of them say even in front of their kids. It sickens me and really put me off of the whole relationship thing. I don't just mean magic, a woman who was still married bragging about how she "caught her man" by getting him drunk and using him to get pregnant. If it was a guy, it would be called rape but because it's a woman he must have wanted it (even passed out) and it's for his own good because men need women. Thinking about it pisses me off. Knowing that people think I'm crazy for feeling that way pisses me off even more.*

Man, there are lots of people in the world, and they're all different. There's good folks too. Good folks who will like you and who you will like. A good relationship is a wonderful thing. Other people are what life's about, it turns out [1] - the rest is just a pretty backdrop. Ignore all that crap stuff, it's just news and filler, nothing to do with you.

[1] This is another way of saying, life is about consciousness, really.

...the whole ducking point here that you pricks have been teaching me is that empathy is bad and morals are bad...

Is that really true? I thought a lot of this stuff (although not this particular post maybe) is about empathy and connection and all that stuff. In fact, it the comments in this post say anything, it's that manipulation never works for happiness, there are good people, and we should find our moral compass and stick to it. (Or we'll be made to, eventually, by circumstances - in my opinion.)

Q3: *Yes we all like morals, but then defend the lady bragging about making a man who left her a slave for 20 years. Again, nobody will try to touch that fact. Nobody has tried to explain how what I did is worse than that. I'm done. You people made it very clear that morals will just get me in trouble here.*

Hmm, I see where you're coming from - but it's a fact that everyone makes mistakes. And it's also a fact that it's really not clear quite what's happening in these cases. No excuses, of course: the intention is what matters I'd say. Remind me what you did again?

There are no "you people"; there's just a lot of individual people (well, "we are all one" of course, but you know what I mean). So don't look at all of /r/occult the same way - more importantly, don't treat the world that way. High horses are pretty nasty things to fall from.

Q3: *What I did was get mad at a woman bragging that she made a mental slave. Then she ends bby complaining that after 20 years he is now only blindly obeying half the things she says. Then another freak asked her for advice on doing the same. I know not all users are that, but a lot are. They proved that yesterday when I was hounded for saying what I said.*

Ah, got ya. Things started getting lots in the comment-storm. I guess the trick is, to just skip over those ones.

...

It's just so funny when a person has an emotional re[s]ponse.

Someone get a Voight-Kampff test on this guy. Just don't ask him about his mother.

Joking aside - why so fighty? Pretty much everyone here is up for a pretty relaxed discussion, even when our opinions are totally opposite. It's about exploring ideas, rather than winning arguments or persuading others. No problem with someone thinking that something they've done in the past is morally dubious, for instance, but it needn't be so personal. Most people already know that they've "done bad" and have learned from it. Most people are just trying to find their way. Everyone goes through a control-the-world phase. Gets bitten by it. Then tries being-the-world, hopefully. Which is nicer.

Hardy har har

Yeah, sorry, you used that phrase so I couldn't resist! :-)

...

What's amusing is: you wrote your post as a bit of a troll for a laugh - but actually some of the replies are some of the most thoughtful there've been here in a while. Except for your replies. ;-)

POST: Realization about dream and reality.

I was never on fire to begin with. Guess your superpowers must not be working. Try flying yet?

The flying is easy...

In a dream certainly. He claimed it works the same in the physical reality, I just want to see that work.

...then, it's the landing that's going to be "impressive".

Ah just got that. Funny. Reminds me of that line "it ain't the fall that kills ya, it's the sudden stop on the way down

Ah, just remembered where it's from originally, for me anyway: this [<http://www.extremelysmart.com/humor/howtofly.php>].

POST: Something with the third eye

[POST]

So, last week I was talking to a friend and he started to talk about magick and stuff. After a few minutes of conversation he started to talk about his girlfriend. He told me that in her whole house there's many empty bottles, and that the sister of her girlfriend who's 13, washes her naked dolls everyday, like a ritual. Then, he told me that the child also see dead people, like ghosts and talk to them, help them. According him she can see the destiny and the aurea of people too and the whole family practices magick. My fear is that the girlfriend who's very depressed and a bit maniac causes anything againts him in any point of their relationship. For now her intentions are good but the future's uncertain. Anyway, does anybody knows why there's bottles, or why the child washes her naked dolls or even if all of this make sense.

[END OF POST]

Q1: Witches bottles?

[http://en.wikipedia.org/wiki/Witch_bottle]

edit

OK, so that doesn't cover why there are so MANY of them in the open and empty. But bottle based spells of a similar kind could be part of the family's practice. I have a friend who imprisoned a nasty spirit in a bottle and threw it into the sea.

[QUOTE]

Witch bottle:

Witch bottles are countermagical devices used as protection against witchcraft and conjure. They are described in historical sources in England and the United States. The first mention of a witch bottle appears in the 17th century. One of the earliest descriptions of a witch bottle in Suffolk, England, appears in 1681 in Joseph Glanvill's Saducismus Triumphatus, or Evidence concerning Witches and Apparitions:

[END OF QUOTE]

I'd never heard of that - fascinating.

POST: Something with the third eye

You maybe used to leave your centre of attention too close to your eyes? (How is you vision generally, by the way?) Touching your nose/forehead is encouraging you to change 'where you are looking out of' - not your focus or target of attention, but rather 'where you sit' inside yourself. This came up in another thread, but you might find it interesting: the idea of "seeing from the core" [<http://www.reptilianagenda.com/brain/br121804d.shtml>]. Basically, you don't see with your eyes; you see with your mind. You actually don't want to be focussed on the sensations of the eye area in general life, and definitely not when meditating or trying "other stuff".

POST: what's the most profound statement or inference you heard from someone who has no occult experience?

AI: The wisest thing that anyone can say is, "I don't know."

S'good. Basically, "if you make every act be magickal act towards your desire, your desire will surely manifest".

...

...it's almost like we form an expectation in our minds of how it's supposed to happen, or what we need to achieve it, and that sometimes this expectation is a hindrance.

The hidden structure of our minds - belief/expectation - restricts the apparent routes things can seem to take to get to us. No sudden materialisations or discontinuities! Breaking yourself down into clear openness is probably the way to get things more directly (vs the traditional route of trying to forget it so your structure doesn't get a chance to influence things).

POST: Is there any ideology/religion that you find "wrong"?

Religious organisations tend to want complete control over their followers (christianity too), but that's a matter of the nature of people, and the power that privileged positions and promoting certain 'interpretations' gives, and capitalising on the fear of the times, which then gets perpetuated. Religions themselves, the original teachings, that's a different thing.

*Q: original teachings
Are a hard thing to 'prove' to people :/*

Yes. You have to 'prove' it to yourself, by experimentation.

POST: Why do you believe the way you do and how do you know you're right? Seeking truth....

All content is 'illusory', in the sense that all objects are mind-based, shaped from a background enfolded structure, corresponding to habitual forms which feed back on themselves, unfolding as "things". The more you go seeking in the world of objects - patterns in experience - the more detail you will discover, the more levels of granularity you will uncover. For as long as you attach yourself to the objects, you are bound to them I'd say. Identify with the background awareness, then you are free? Step back in to the space in which experiential content arises - and so recognise your experience is like a "mental dream-space".

No content (the structure, objects of experience) can ever be truth. **No belief** (the enfolded forms which lead to the spatial and temporal structuring of content) can ever be truth either.

POST: Magic Room(From Prometheus raising)+Questions

[...] what is it you don't get?

Q: the way to astral project and create the room and the computer

In this example, you're not meant to actually astral project, necessarily. Doing the thought experiment is enough. Just imagine yourself leaving your body and finding yourself in a room - and do the exercise in your mind.

To play this game you simply “astrally project” into the Magic Room. Do not ask what “astral projection” means, and do not assume it is metaphysical. Just assume this is a gedankenexperiment, a “mind-game.” Project yourself, in imagination, into this Magic Room and visualize vividly the Omniscient Computer, using the details you need to make such a super-information-processor real to your fantasy.

In truth, you don't even need to do any of this. You can just directly do the magick here - getting information, adjusting yourself, adjusting reality - by "wishing" or "deciding". More here [missing]. The rest of the imagery is just to provide you with a technique that is fun and accessible. Sometimes it helps if people feel themselves "doing something". As you can see with the Douglas Harding version above, that's all theatre and window-dressing; the details don't actually matter! :-)

(For actually astrally projecting though, see link I posted later. EDIT: this [<https://www.oniros.fr/A1417.pdf>].)

*Q: AND I HAVE BEEN SUFFERING AND BUILDING AN ASTRAL TEMPLE ALL THIS TIME
GOSH
though I tried asking it question of my fourth grade teacher and it didn't answer*

Hey, just trying to be helpful eh.

POST: Even if necromancers could talk to the dead for divination, why would they think that the dead would know the future?

They may not in fact be talking to the dead, but rather their idea of the dead - their anticipation and belief in future-knowing is sufficient to extract the information from the universe.

POST: What are some good techniques to remember one's dreams or dream more vividly?

Before you go to sleep, just really, really make the decision to remember them - "I will remember my dreams / I always remember my dreams" - and know it to be true. Most other techniques are in fact a variation of this: they are 'magickal' acts that you've decided will help, that say you are serious.

POST: Nous the cause of existence?

Nous is not a thing, but can take on the shape of things. Like an infinite blanket, which folds itself and therefore creates contours relative to itself. The contours/folds "exist", these are your objects. Nous itself does not "exist" in this sense. It's tempting got try to imagine Nous as a 'space', but even this is wrong, because Nous has no structure whatsoever. Space is a structured 3-dimensional object with implied boundaries and locations. Nous has no properties whatsoever. Nous is not, and does not, but becomes, and is.

POST: Do you find yourself "siding" with Chronos or Fotamecus? Neither? Both?

On backlash, it's not personally inevitable:

Even though we killed 45 minutes at a rest stop afterwards, when we re-entered the freeway we met right up with the other car even though they had never stopped. We thought the magick had worked very well until we received the backlash later that day. For time compressed, an equal amount of time was expanded. The balance was kept. Travelling at sixty miles an hour, a fifteen mile stretch of desert highway took nearly an hour to cross. If we had already reached our destination, the expansion would have been fine, but Fotamecus was only able to hold off the backlash from the initial compression for so long. After several similar events we mulled over various ideas to correct the problem of backlash and hit upon the idea of viral servitors--- the key to a process of mutation that would allow Fotamecus to eventually grow beyond our control. We worked several rituals in which we altered the sigil to make it possible for Fotamecus to make copies of itself. These copies wired themselves into a network that made them incredibly effective at preventing unwanted side effects. If one of them needed to compress time and another to expand it they would pass it off to each other through the viral network, maintaining balance and reducing the possibility of backlash. -- from Don't Blame Me, Blame My Servitor

If Chronos just needs to be satisfied and balanced overall, then there is plenty of flexibility on offer. Potentially, taking the larger picture on board - targeted offsets - we can save all the time we want, provided we don't mind the planet Neptune's rotational velocity gradually slowing to a complete halt, say. What matter the integrity of the solar system, if it helps me get to work on time? :-) Meanwhile, if you work it right, it can be fine personally too: Compress that workday into an hour, expand that evening into a day. Time is balanced, but we get more of what we want.

Q1: Absolutely. If you don't give Fotamecus some direction, he'll do things as he sees fit. That often means you end up paying, but there's no reason you can't shuffle the bill around a bit instead.

This is generally true of magick, I guess. If you aren't specific, the easiest route is taken, the path that breaks the minimum number of "rules". If you are, then you can push things a bit further.

POST: The Idea that Materialism and Occultism are Mutually Exclusive Is Bullshit.

Results separate True Occultism from mere Philosophy.

Quite so.

*Q1: You seem like a snake, because You are still very attached to Duality. I can sense you, but you're being cool at the moment, so I'll give you a 'pass.' Just don't act like a dipshit (like the Others) after the Consciousness Shift, and you too will flourish in the New World.
000, 111, 222, 333, 444, 555, 666, 777, 888, 999, 00011000.*

Thanks for the 'pass'. I shall keep it safe. See you "after", then.

POST: Stupid question: practical magick?

Check out Phil Hine's Oven Ready Chaos and Alan Chapman's Advanced Magick for Beginners. They get straight to it: the magickal act is what you intend it to be, the rest is just so much theatre (potentially). Also, find a daily relaxation/letting-go exercise that works for you. Even just lying on the floor for 10 minutes twice a day and "giving up to gravity" can reset you and help keep you 'grounded'. The most effective power is... you.

POST: Is it dangerous?

Watch for obsession, as another poster suggests. Also, keep in mind a purpose, and make that purpose definite and real-world based. Getting lost in infinite reading and fantasising and ritualising won't help your life. However, finding out about how the world works and using it - for self-improvement and understanding, and enhancement of circumstances - is all to the good. Just make sure to live your everyday life; keep grounded. With OCD/anxiety, it can be tempting to reduce your focus to a distraction (which is really all OCD is) to avoid whatever-it-is-that-you-are-avoiding. Some kind of mediation may help.

POST:Myth buster: who here personally has gone temporarily insane from magick?

I just feel like the dangers are massively overstated. My consciousness, for good or ill, is extremely tenacious.

The danger is one of focus and perspective. You can end up locked into a worldview at the expense of daily practicality. Hence needing to stay grounded. Magick works with normal life, in face normal life works by magick. There's nothing "special" going on, it's just the practising magick brings about more extreme versions of what's already happening - and that can be very disorientating if you let it consume you.

POST: I have a question about a very popular type of "magic".

Q1: I know a very powerful witch that told me once the key to working love spells successfully is to love yourself. He said you should indulge in your beauty and masturbate like crazy. You don't want to WANT love. You want to BE loved.

Yeah, classic approach: Summon the feeling of the situation that you want to have, as the key thing.

POST: Anyone else feel like this when first beginning?

RAW got me started: Quantum Psychology and Prometheus Rising. You can really overthink this though: it, of course, is actually super, super simple. The more you think about it, the more you will obscure it. You "are the dream, are consciousness" right now - you are just obscuring it by looking and thinking. There is no theory to this, it is not made of concepts and cannot be understood in that sense. It can be talked about, but really it is something you experience. Do a daily practice like this:

- 10 minutes, twice a day.
- Lie down on the floor, feet flat with knees bent, head supported by books, arms by your side or hands resting on abdomen.
- Decide to give up completely to gravity: to "play dead".
- Let go of your body and mind, let them move as will. Allow them to unwind.
- Don't even "pay attention"; just let it be open and wide. If it focuses on some thought or pain briefly, let that happen, and let it open out again.
- After 10 minutes, decide to get up, but don't do anything about it. Wait until your body moves by itself. (Thus won't happen first time, but eventually it will happen.)

Basically, you are letting the "stuck thoughts" and "uncompleted movements" you have amassed unwind and dissolve themselves. You do not need to do anything for this to occur. Gradually, your perception will become clearer and clearer. Note: Any effort to focus or do anything will get in the way. There is a method of accelerating this by "overwriting yourself", but it's nicer this way.

...

Q1: I feel like the objective truth is Inifity itself (the All-That-Is, God, etc). But, if this is the case, then it become a giant paradox due to spawning paradoxes all over the place. Infinity would say that nothing is true and that everything is true (or CHAOS and ORDER coexisting at 100% for both of them), but in our limited ability to understand the duality of this, we see that the two currently cannot exist at the same time, but they have to. We just don't know how, but we can make some damn good guesses, yet they will never really be 100%, because they will always be a part of the whole and not the whole itself. Hopefully you understand what I am trying to say :)

Perhaps chaos is enfolded into order, or vice versa?

Q1: How many you's ARE there?

As I understand it, it can be an infinite amount. Depends on how far down the rabbit hole I want to take it.

How can an ego dissolve itself?

Not quite sure, but I feel it comes about from not having a need to protect the Self or a need to identify and separate the Self from the Whole. It dissolves from knowing that it is Infinity, but it is hard if not impossible to do when you are seeing all this from your individual conscious perspective. How can you describe infinity in its wholeness when you can only work from within it, never all of it unless you become all of it, and never from outside of it because there is nothing outside of it.

Some of the most basic thoughts are the 'craziest'...

And also some of the most True.

My thoughts:

The ego is just a mental thought that you (that is, consciousness) are having. You are infinite - you can "feel out" into space forever, right now, you will find - but you do have a perspective. There is no way to conceptualise this or intersubjectivity. You basically have to give up trying to work that out. The best way is to think of yourself as being All That Is, on a "time-share" basis. In moments when it is your turn, you are the whole thing. Or for convenience, just treat this as a dream, where you are the dream. The bunch of body sensations in the middle you have tended to think of as "you", but they are within the larger consciousness (the actual you, the dream and the dreamer and the dreaming, same thing), you just got in the habit of misidentifying with that part of the dream experience. You are an infinite self-aware blanket, which forms itself into the shapes of experiences, thereby experiencing itself. The blanket truth! [<https://youtu.be/XfliRKLMjDY>]

Dunno what you've been reading, but I found certain things keep my sense of reality "loose". Read Rupert Spira and Greg Goode on non-duality. Read Advanced Magick for Beginners by Alan Chapman. Check out idealism, and lucid dreaming (Robert Waggoner's book is great). Shake up your direct experience! :-)

Magick is just committed intention, and it always works in some way or other (even if it just results in a dream of your desire). If you can get into the mindset of expanding your a Will and Presence into the whole dream, you will find that helps.

POST: how i think sigals work

A desire, almost by definition, is something you're holding on to. Nobody ever held onto a fulfilled desire. Magick (sigils, whatever) is a method of letting go of desire, releasing it psychologically, so that rather than being within you, it appears in the external world. Which is also you. It's a simple change of location, really.

POST: What is magick?

New fun definition for today: *A desire, almost by definition, is something you're holding on to. Nobody ever held onto a fulfilled desire. Magick (sigils, whatever) is a method of letting go of desire, releasing it psychologically, so that rather than being within you, it appears in the external world. Which is also you. It's a simple change of location, really.*

Everything works by magick. Intention => result. It's just that some results seem more linked - spatially or temporally - than others. The more distant the link, the more amazed we are (also, the more unlikely we are to intend such a result). The trick is, though, that experience is structured according to the concepts you have accepted. This applies to both the more advanced esoteric efforts, and to the everyday movements of your body and mind. Once you've tried some more exotic "requests" and had them answered, it'll mangle your notion of your sphere of influence, and perhaps what "you" are.

Q: Once you've tried some more exotic "requests" and had them answered, it'll mangle your notion of your sphere of influence, and perhaps what "you" are. This is interesting. When you mean exotic "requests" you mean something slightly past that threshold of believably right?

Right. Something that pushes the temporal, spatial limits.

POST: Any Artists experienced in Sigil Magik?

Q1: There's an easy way to do it yourself. Just write out what you want the sigil to do, remove all vowels and letters that repeat, rework the remaining letters into a pattern that looks good enough, then charge it. Since you're doing it for a band, I'd suggest finding a musical or vocal way to charge it.

Q2: That is actually a really cool Idea!

Or - write out the purpose of the sigil. Remove all letters that don't correspond to those associated with musical notes. Maybe designate capital letters as 'sharps', lower case as unmodified. Then rearrange into a melody, or use as the basis of a chord progression - to create a sigilised song. Work that represents your work!

Very meta! :-)

POST: help name suggestion for a new music label that will attract goodgood fortune

Hmm. How about something like: 'Just My Luck!' Records.

And here is your logo:

- It's a vinyl record because you're a music label.
- It's slightly amended to be shaped like the outline of a fortune cookie, because you want to attract good fortune.
- It's purple because that's one of the lucky colors for the Year of the Horse, which is what 2014 is.
- And, of course, the record player needle is formed into a 'J', the initial of the label name - but also a 'smile'.
- The label name appears underneath in the style of a fortune cookie slip. (Alternate, cleaner version without the outlining here.)
- The font used throughout is PT Sans, which falls under the open user licence for commercial and non-commercial use.

Basically a sigil and a logo and name and good fortune, all wrapped into one handy package. ;-)

Yours to do with as you please.

POST: I have an honest question for people who practice occult things.

Most "Spells" are handed down by to person to person and books etc. What is stopping anyone from creating new spells or occultic practices that are unique to that person or that persons circle of friends?

Look up chaos magick or Alan Chapman's Advanced Magick for Beginners. People invent new approaches all the time, if they're into that sort of thing. They might not easily be called "spells" though. That's a bit 'Harry Potter' / cheesy websites [<https://www.spellsofmagic.com/spells.html>].

Q1: [http://www.spellsofmagic.com/spells/love_spells/commitment_spells/14662/page.html]
I call naivety! Look at this piece of.... Gold I found

Call naivety at me? (As in, you do realise I included that link as a joke, yeah?)

I didn't mean at you (I just woke up!). I mean at the website!!

Aha, just checking! :-)

There are some classics! Thing is, a couple of them almost correspond to genuine spells in older literature. (One of the 'invisibility' ones is the classic 'quiet yourself down' approach to be less conspicuous, so someone is doing a bit of reading sometimes.) Most, however, are - um - not!

Gonna do me some teleporting/time travelling, definitely - - -

...

But... but... it tells me how to time travel! Come on! I want me some 'flying ointment' too.

Actually in comparison to the first-mentioned website, it's not that bad.

POST: I just had a strong experience while meditating gazing into a mirror.

Q1: Any advice on what the hell happened?
This is a common question. People have experiences and they're trying to fit them into a conventional framework of some kind, so they ask peers to help categorize the experiences. If you understand why it's good to have some things stay outside convention, then the need for this will be reduced.

But, y'know, it's fun! ;-)

POST: How do you attain Buddha nature with a roof tile?

Simply sitting in meditation "exclusively" does not change anything, and by doing so you are not "polishing your character" to make it clear, you are simply being-as-you-are, unchangingly without investigation or examination. The tile remains the same old tile after Nangaku's efforts; Baso remains the same old Baso after his unexamined sitting.

POST: How reliable are the spells listed on this website?

That is a "fun" website really. Having said that, you can potentially use anything, with the backing of proper intention, to get what you want, so it could be used for inspiration to spice things up once you know more about what you are doing. Some people use "spells", others less so. Depends on your taste. Pretty much, you should invent your own approach in the end, once you've become accustomed to the ideas. For 'traditional' stuff, read Aleister Crowley. For chaos magick, a more relaxed approach, try Phil Hine's Oven Ready Chaos. For an even more free-form approach (anything goes, any act is magickal with intention) but which covers most areas, I recommend Alan Chapman's Advanced Magick for Beginners. (Follow links or Google in each case, pretty much everything is out there somewhere or is reviewed and discussed by someone.)

Then you might decide you love ritual and potion, or something more direct, or come up with your own crazy mix. There is much fun to be had.

P.S. If you ever manage to create yourself a time travel watch using that website, I want one!

POST: I'm asleep all the time

Where about 'in your body' do you experience yourself to be 'looking out from' - if at all?

Yes, I see things "from my body".

So, you might imagine/feel that "you" look out from a location just behind your eyes, or in your chest even. Where it is can change how the world seems, so maybe play with that: centre your attention in your abdomen, or your forehead, and see if that makes a difference? Being on the centre line can make things clearer, vision and perception wise - see here [http://www.reptilianagenda.com/brain/br121804d.shtml] for instance.

POST: It's been fun but I've failed

Don't give up; I know where you're at.

There are lots of types of "magick", some of which may not fall obviously under that banner. For pain, for instance, try John Sarno's The Divided Mind (just reading the book helps some people) and Les Fehmi's Dissolving Pain (awareness-based techniques, opening out and relaxing).

For depression though, keep busy! Stop thinking. Completely. Life can't be worked out, it's not something that can be "solved", and depression doubly-not. Wash the dishes, clean the bathroom, make tasty meals for yourself, make yourself socialise no matter what. Decide to get on with life no matter how you're feeling (easier said than done, but you can't solve the depression and then live, it works the other way around). Physical pain often comes hand-in-hand with depression; the ongoing "compression" feeling can be the problem itself. Do a daily relaxation exercise (lie on the floor, head supported, and "give up completely" for 10 minutes) to let yourself settle out at least once a day. Main thing is to be good and compassionate to yourself, and forgiving! I was always super-harsh on myself when I wasn't "happening", and that was the worst thing to do.

Good luck! :-)

(Meanwhile, Alan Chapman's Advanced Magick for Beginners helped get me back into it in a post-chaos way, if you are looking to rekindle your interest more generally. Anything done with intention is magick.)

POST: A request for help with Astral Projection

As has been mentioned elsewhere, the trick is to ignore the sensations and continue to focus on what you want to achieve. In the hypnogogia approach (which seems to be what you are trying to do?), let the sensations alone and continue to attend to letting the fragments and images form, and then crossing over (better description here). You'll get all sorts of wobbles and vibrations and perhaps noises; leave them be. You are not trying to enhance that sensation, it's just a byproduct for what you are doing.

POST: Hi Occult. Who Am I and What Can I Do?

Q1: If an Object existed long enough to have all it's parts replaced, is it the same Object? Didn't this happen to some axe in a museum somewhere? I think it may have been Abraham Lincoln's. EDIT: Nevermind, apparently this is a hypothetical axe [https://en.wikipedia.org/wiki/Ship_of_Theseus#Enlightenment_era]. Nevertheless, good question.

[QUOTE]

Ship of Theseus The Ship of Theseus, also known as Theseus's Paradox, is a paradox and common thought experiment about whether an object is the same object after having all of its original components replaced over time, usually one after the other.

[END OF QUOTE]

Yes, you are basically "shiny and new" on a surprisingly regular basis, even your brain. Good article here. Your body is a pattern, not a thing.

...

*Q2: Hey like I said on a previous answer, professionals arent serious all the time. They fuck about more than regular folks. Ask any firefighter or military member. If you think doing something at a high level that you must be serious and "on" all the time, and start to think to that so many things are beneath you, that is the surest way to go insane, whatever field you take. And if you havent caught on to the analogy, I am retired. I would like to enjoy wasting my time as much as possible. And no it is not cleared up because it wasn't muddy to begin with. I wasn't asking clarification with what you were trying to do, I was calling out your lack of manners. Which I take special offense to because I was very generous with my answers to you. Maybe I should try out whether I'm a liar or not by fucking your shit up from all the way over here. Or you could just apologize for being rude. Up to you, Duke.

Hey, he was having a little joke - about himself really. As in, his idea of an enlightenment person would be some beyond such physical-world trivialities as reddit posting, so now he's (pretend) "disappointed" because it's not true, because you've posted on reddit!

Q2: Lol come on, I understand humor. I'm a humorous fucking guy. But... "better at language" "more humble" "reddit shitposting" that's not humor, those are verbal jabs. especially after I've tried to answer every question and comment he had respectfully, that's really asking for it. good on you for trying to peacekeep though.

Aw well, it was worth a go. :-)

Q2: Nigga kept using "fount of consciousness", and he thinks Im bad at communication? Looool I can just smell the crease on his fedora. Fucking loser. IF YOU SEE THIS YOU LITTLE FAGGOT ILL BE WAITING ON THAT APOLOGY FOR 24 HOURS. AFTER THAT THE CONSEQUENCES BELONG TO YOU. Anyways, you seem like a good dude. Whats your story?

Nowt wrong with a fedora. Unless you're Shia Lebeouf. Me? Enlightened, re-integrated Ruler Of All That Is. Y'know, usual everyday stuff. Dream-weaver, etc.

Q2: :) What do you mean by Ruler of All That Is?

Where do you think you are right now?

Q2: Do you ask that in the physical sense? The philosophical sense? Or the you know youre on reddit so nothing is serious sense?

Excellent response. The answer to all three, of course, is: in my mind. (You're lucky I keep it so nice and tidy and have maintained the air conditioning. Sorry about screwing up the world peace thing though.)

Q2: Ah ok.

More seriously, how does your experience compare with this, as in:

Awakening => Liberation => Enlightenment

As a stages model of development.

Q2: Like comparing going to fat camp vs being a pro athlete.

Nice. I say, jump straight to delete.

POST: Anyone else practice magick rather loosely?

I think the most important thing is that you feel a "fit" with your approach, or you won't commit yourself properly to the intention. At root, the acts don't necessarily matter in themselves. Check out Alan Chapman's Advanced Magick for Beginners for the most open version of this (basically, an act is what you decided it to mean; the rest of it is theatre).

Generally, the more you invest in something, the more results will take that form and the more your experience will adjust to match up with it. Getting yourself to invest can be the real trick - to "get out of your own way" - and that's where a lot of the extra bits and bobs appear. Also, philosophically speaking there are and have been lots of ways to "view the world"; it makes sense that peoples magickal viewpoint emerges from that. But what was 'obvious' even 100 years ago is less so now. This stuff has to be reinterpreted and reinvented regularly, to retain its meaning and utility.

POST: Serious inquiry. The occult has always been a big part of my life, but lately I've been experiencing quite a bit of negative happenings. Could I have done something wrong?

Were you... drinking, at the time of the accidents? Forget the occult, just start focusing on putting things back together. Depression is a spiral: events will arise consistent with that "vibe".

Learn some powering up is good though, as other poster suggested. Try lying down and visualising "golden energy" engulfing and liberating you, etc. Let go to it, abandon yourself to the image completely.

Also, decide to give up analytical thinking: do it today.

POST: Personal Perception of the Human Condition

Interesting. The purpose of life is... living!

Some questions:

- Is "Me" under my control?
- Is "Me" something I am, or something I am aware of or 'perceiving through', like a viewport onto the world?
- What is consciousness vs God? Are you a "fold in God's awareness" or are you a separate thing with it's own consciousness?

Q: Interesting how you're talking about Gnosis. I generally agree with you, except on one point: God is not the whole of humanity. It is tempting to think so, but in reality, we are all separate entities sharing the same world, or realm. There are different aspects of the realm that only a minority of humanity can reach or tap into, and it is up to the individual to discover that. God may exist, but humanity's conception of him is an egregore, used to shape and control the various societies and cultures. It exists in effect, but not in actuality. We are not one, as much as we love to think. In order to come to terms with oneself (which is basically the point of Gnosis), one has to see in fullness what he or she is, and what separates him or her from everyone else. This is critical.

Hmm. "God" exists as an egregore, but God is the name given to the ground of all existence, surely?

POST: Are Psychics real?

Real... what?

POST: Best Beginner Book?

I'd say Alan Chapman's book, which has been mentioned elsewhere, and Phil Hine. Also SSOTBME: An Essay on Magic, by Ramsay Dukes, the precursor to Chaos Magick but much more philosophically structured than most books. (Revised edition circa 2000.)

Q1: I don't think there is a "best book" for an absolute beginner. It depends where each individual is coming from, everyone has a scope of experience/perspective that they are going to fit information about the occult into. Say for example, you happen to study psychology best book to start with would be Jung's Red Book as it delves into the magickal mindset in a way that will speak to your knowledge base. English major? Try Poulet's Phenomenology of Reading for a primer on subject/object unification theory. Best couple of books to start with might be: Modern Magick, Tao Te Ching, Chicken Qabalah, Upanisads (specifically Chandogya, Brhadaranyaka), Meditations on the Tarot by Anonymous, Garden of Pomegranates, Liber Psychonaut. The thing is that there is no best book to begin with. You have to read a lot of books before you start to even get an idea of what this whole magick thing is about. I suggest instead of worrying about a best book to start with you should start thinking about a list of books.

Totally agree with no best book, but it's definitely easier to start by reading something modern and perhaps not too steeped in ritual or wordplay.

Q1: Agreed. It's hard to tell what reading level people are coming from. With these "I'm a noob" posts I wish people would include. 1.) What got you interested in magick/occult and what would you like to get out of it. 2.) What are your preconceived notions about it. 3.) Do you prefer structure or flying by the seat of your pants. That would be helpful.

It's half the problem: They don't even know that stuff yet! It's just, hey I'd like to get into magick, whatever it is, then see what I can do, and see what styles there are. I guess that these days the wealth of material available is actually confusing. When it used to be there was just "whatever book was in the library, or your friend had" then there was no choice and so it was ironically easier to get started. I just say "the Chapman book" these days, because it touches on everything and is written in modern sarcastic language, then they can jump off and see what they like afterwards.

*Q1: I'm a bit embarrassed to say I've never read Chapman but I guess I should.
I think you are right about an over-whelming amount of material. It doesn't help that half of it is tripe! It can be daunting to think, okay there is all this material, but everyone disagrees on it, who do I listen to? Everyone should get a good primer on sourcing and rhetoric in my opinion. Teaching people how to find reliable sources is way more important than finding a first book per se. I also think that instead of pointing out "theory" or "how to" manuals it's also important to direct them to biographies and letters. The history of people is important! I think we tend to forget that there are people behind those books, with their own flaws and motivations. I mean it's important to know about all the splits in factions and why. For example, people frequently ask about AA lineage and want to know what the "right" one is but they don't want to do the digging to find out why Achad was disowned, why Kenneth Grant's order was disparaged.
Instead of a best book to start with page I'd like to see suggestions for mindsets to incorporate. Like question sources and find primary documents, laugh at yourself, play games with your mind, break yourself once in a while, as you read keep a running dialogue in your brain about what you disagree/agree with and why, embarrass yourself, do a random act of kindness, do a random act of meanness, have enthusiasm, doubt yourself regularly.*

And the disparity between people's theories and their actual lives. Someone once told me that, when in a particular job or whatever, you should look around and "see if you'd want to be any of those people". That applies to much of this.

Mindsets: That's a very good suggestion. And, slightly related, an awareness of the metaphysics behind (a) magick.

POST: How do you think magic works?

Random screed. Magick works...

By intention, limited only by the structure and habits caused by previous intentions. Magick is simply a self-conscious version of what's happening all the time anyway.

Focus on a 1st person perspective here: The experience you are having right now. Left to its own devices, your world will unfold and flow in the same direction, unless interrupted and redirected. (By 'your world', I include your thoughts and your bodily actions and the larger environment; none of these are "you", they are all 'effects' and 'results'.) Intention is the way we do that redirection. The acts you perform don't matter, the intention behind them is what causes change.

Every act always has an intention. For instance, when you grab a cup of coffee the intention associated with that act could be "to grab a cup of coffee". However, it can equally be "to win the lottery". The actual act is irrelevant. If we view magick as "the means by which we summon a desired experience", then intention is the 'seeding' of that desired experience, which then ripples out. Intention is 'setting a target' for your world, and your world then unfolds towards it.

There is no underlying "solid" reality beyond the dream-like experience of the senses, therefore any experience is possible. However, because your world has developed certain 'habits' and a certain 'stability', this generally happens according to "explainable routes". In other words, there is rarely a sudden discontinuity in your experience. (If there is, then your memories would fall into line with it anyway.)

You can work on yourself and your beliefs, to make results appear sooner and more 'miraculously'.

*Q1: I believe that reality is constantly self-generating itself at the will of consciousness (I), so if we are able to alter our consciousness, then we are able to alter our reality. I feel that this is supported by the double-slit experiment, and in fact you could say it's the foundation of my personal theory, though I didn't consider the DSE when creating it. Simple, I know, but it allows "magic" to be extremely accessible and armed with a LOT of potential. It basically labels reality as illusory, and when you see it this way you can do anything you want with it.
EDIT: Other posts have inspired me to go further...so existence is like a pyramid, right? As our consciousness ascends into higher places, we encounter concepts and archetypes that grow more and more distant from physical reality. These archetypes are within us humans, since we are both animal and divine, but our animal minds cannot fathom these archetypes and their scope; attempting to do so would render us mentally blinded. So we make these archetypes more easily accessible by humanizing them and associating them with things in the macrocosm; after all, it is all part of the same source, right?
When we do this, we create a path upon which our intentions and desires can travel to the top of the pyramid, like the path that a seed takes as it grows into a fruit-bearing plant. All we have to do then is pick the fruit when it is ready, or wait for it to drop into our hand. ;)
All of this takes place from within, because we have the whole universe inside us.*

I believe that reality is constantly self-generating itself at the will of consciousness (I), so if we are able to alter our consciousness, then we are able to alter our reality.

How does this accommodate the different intentions of multiple magicians?

Q1: Could you elaborate a bit?

So, I agree with what you say. My own picture is that everything resides within consciousness, all possibilities are contained within it. What we do with intention is that we "seed" a new experience, enfolded into consciousness, which then unfolds, ripples out, until it is manifested as an experience we have. (Whether that is the "experience of owning and driving a Ferrari" or "the experience of meeting that nice girl" or "the experience of doing well in my exam.)

However, how do we account for "other people" here? Are they separate from us? And surely different people are intending for different, conflicting things? How is that resolved?

*Q1: I think I see what you're saying...and it's actually a good observation to make.
I'm honestly having a really hard time answering this. There's a definite philosophical element to this...sort of like merging the gap between objectivity and subjectivity. We need to take this one step at a time...and I hope I explain my reasoning clearly.
The most difficult part of answering this seems to be the paradox that we are individual souls, even though we come from the same source. At the core, we may have different ideas of satisfaction, different images of the perfect fruit, but it all starts with the same principle: a seed. It is a universal principle.
So it's sort of like planting seeds in a garden. The soil nourishes all seeds just the same, even though in the end, the fruit that each seed bears will be very different from each other. What you're asking is like asking how the soil accommodates the growth of all plants.
When we see it like this, we reach a sort of understanding, a logical dead end, if you will, and we could technically use this analogy as an answer...but it can go further. The real question here is not answered by asking "how," but by asking "why?" Why are we able to manifest our own intentions, even if they may be different from others'? Why are we able to live out our own subjective experiences when we derive from the same source?
You've opened up a philosophical Pandora's box, my friend..
EDIT: Object agreement*

My suggestion is: "Maybe it is all taken into account, all the time."

When we 'seed' an intention, it applies to all time and space. The whole of reality is reformed with that taken into account, and everything else taken into account. So it doesn't matter if you ask for a limited edition Ferrari, and slightly later I do too. The narrative of the universe will accommodate this. If when I did it, there was one Ferrari, when you do it, there will be - and will always have been - two.

There is no timeline of history and events that we move along, fixed or otherwise. Intention is fact insertion at the root, essentially, and the universe/mind always tends towards a coherent narrative. (See the bottom of my post here [Darkroom Vision & Chef Hats & Dreams], for an example in dreams.)

Something additional to contemplate: The reason we don't often experience discontinuities - say, when I 'magick' a taxi to be waiting round the corner, it doesn't seem to just materialise, the driver always has a story about how he came to be there - is because everything is reworked this way. If the taxi did materialise this second, our minds/memories would return a 'story' to explain it when we went looking for such a memory/explanation. (This happens a lot in hypnosis: Tell someone that John will now vanish in mid air, and they'll say he "must have left the room, out the door, when I was distracted".)

Meanwhile, we might imagine ourselves to be experiencing the world from different perspectives on a sort of "timeshare" rather than spatially and at the same time. We each get a mini-turn at being the whole universe. (This isn't exactly true: it can't be either spatial or temporal, but it provides an alternative way to conceptualise it.)

POST: At this point, wtf is the point?

7 principles, 42 laws? Sounds a bit much to me! I mean, surely it's just: relax/delete and intend/decide and get out of the way? Belief, or actually lack of unbelief, being key. However, until you get materialisation sorted, you're going to go hungry. Do you have that sorted yet?

Q: And some, what really gets me, as i said before, is we aren't just moving away from the stress and just making the zone. That's what i want to discuss, what can we do so that it's based and no one feels like they are carrying anything and at the same time we can make shit happen for the other shit to experience, unless you just want to forget the rest of it and just see a small degree - there's so much more.

Hmm. I always thought the fun of this was using magick in amongst the muggles - to be super-cheesy. Making the maximum out of living in the city or wherever, making things happen. It we were all in a 'Special Delimited Zone' it would be a bit boring.

For instance, lucid dreams are a lot of fun. Everyone tends to begin by harnessing it and taking control. After a while, though, you usually stop doing that, and explore... tweaking things occasionally to make them more to your liking, but not radically redefining the reality.

POST: Do you guys ever get stumped when you are trying to decide just "what" to do your magick for?

Yep, sounds like depression. So - - -

Maybe just don't bother about wanting stuff; that might be the wrong approach. Instead, concern yourself with what needs done, and use magick to help you with that? The approach: Ask yourself, "what needs doing now?". And then go and do it, no matter how you feel. After that task is complete, ask yourself again. Maybe the task will be "go wash the dishes", doesn't matter. You're being constructive.

As you go along, you might encounter things where magick will help: You need to get some paint of a particular colour, so you "do a magickal act" to make that available, etc. You don't always have to be working towards some "big goal"; being busy is enough. In fact, there are arguments against having goals [https://zenhabits.net/no-goal/].

Christopher Walken said once that he never planned his career, he just did what came up, and that he wished he could live his life by cue cards. Why not do that, using the method above? Who knows what may turn up!

Q: Why don't you do magic FOR Motivation? I often start with that when I just don't seem to get myself to do anything for months

He can't be arsed.

POST: Astral Travel clarification please...

Yes, it's a muddle. I think you can help select the "correct" version by choosing a method that's not too ambiguous. For instance, trying to OBE from a dream or during the night can lead to a dream-like experience, using visualisation you might just enter an image fragment which then expands into a dream.

If you do something more direct, like the "rope technique", then you remain conscious throughout and are actively choosing to "leave your body and stay here" rather than "explore the worlds within", so to speak?

The 'sparkles' technique from this [https://www.oniros.fr/A1417.pdf] is quite reliable, but leaves doubt as to whether you're just seeding a new world to experience. (It's a good read anyway though.)

Rope Technique

Forget visualisation, as in "picturing"; the rope technique is all about generating the feeling of the rope. You lie down, and feel your hands take hold of a rope that's dangling from above, end up at your chest level. Then you feel yourself pulling up on that rope, hand-over-hand, pulling yourself out of your body. You do this from the perspective of it actually happening, right now. It sounds like you might have fallen into the common trap of thinking-about or visualising-about (3rd person perspective or 'elsewhere') rather than trying to generate a direct experience (1st person perspective and 'here, now').

Does that make sense?

Buhlman's pretty enjoyable. You should read Oliver Fox and Robert Monroe too, if you haven't. Fox is good because he was an early pioneer, and his early diary-form is very much from the perspective of a personal experience.

POST: Help a soon-to-be Beginner?

Perhaps you need to realise that Christianity itself is a magickal tradition. Much of the New Thought movement of the early 20th Century was based around an interpretation of the Bible as a reality/magickal manual (e.g. Neville Goddard). This subreddit [https://old.reddit.com/r/ChristianOccultism/] might be of use. You can't push through things with willpower, rather you need to embrace them and include them within yourself, let them become part of your momentum. The reason you are so passionate about this is probably exactly because of this need to embrace and overcome your guilt.

...You just need to push through. It's just conflict/resistance. Don't take it too seriously. Any step forward into a new world or a different way of doing things has this associated with it.

On your other question, the meaning of the word "sin" is to "miss the mark" - it's not "evil", it just means to not be at your best. And those passages do not mean quite what you think. Each essentially says: there are behaviours which get in the way of getting in touch with your true path and nature (that is what "God" is), and because they obscure your deeper intuition (distracting your attention) you will not pick up on the directions and actions you should be following. There is the notion of "True Will" which is essentially Your Nature and what you should really be doing. The warnings against mediums and manipulations is that they can turn you away from looking within, to your deeper knowledge. **"God" is your inner self, your true self, and the "Son" is that which arises in the world from this.** That is why so much of magick is focused on inner exploration and clearing out perception. There's nothing wrong with doing magick, therefore, but you might find that as time goes on you do more 'inner magick' and find that your life flows better and you don't feel the urge to try to directly influence the world around you. 'Passive magick' where you are open and synchronicities arise to help you along, and what happens to you is what you "really, really want", arising spontaneously from within you.

TL;DR: If you feel drawn to this, then pursue that. This 'inner momentum' is what you should be trusting. The scriptures are not saying what you think they are saying. Go for it.

...Hey, that's great. The thing you did there, you'll find useful for dissolving all sorts of barriers. **The world is now yours!**

...Yep. So long as you are honest about how you feel before you push through it (faking yourself doesn't work). When you know what to do, sometimes you've just got to get a hold of yourself and the world, and make it move along! :-)

"Yeah, but..."

It depends a bit on belief and intention. If you believe that "what goes around, comes around" then wrapped in the intention associated with your magickal act will be the idea that you should get hit by it. You will be effectively "wishing for that". You get what you think you deserve!

There's that way of looking at it, and also the notion that "all of this is you", so by intending harm on an aspect of the world, you're basically directing harm towards yourself. Magick can be viewed as the skill of generating desired experiences. If that is so, then you should really only work on generating positive experiences for yourself. Blockages, barriers - whether situations or people - should be allowed to fade or dissolve, or be turned into benefits, not be destroyed.

...I wouldn't get too hung up on that. It's the intention behind the ritual that matters most, with filtering by your background beliefs / expectations of how things work. The world happily gives you what you want, good or bad, it doesn't care. You don't need to watch your individual thoughts so much as take care with the "posture" you adopt. That should be expansive and positive. And you should always question why your are trying to summon something. Note, there are other ways to approach stuff besides formal ritual. See Advanced Magick for Beginners by Alan Chapman, SSOTBME: An Essay on Magic by Ramsay Dukes, or Oven-Ready Chaos by Phil Hine for example. Every intentional act is an act of magick: If you drink your cup of coffee while saying "every sip of this coffee means my day will be luckier", then that is magick. Of course, most people drink their cup of coffee while intending... to drink their coffee. Is there something specific you are trying to achieve?

...No don't worry. Recognise those thoughts and just let them pass, returning to what you are actually focusing on. Just keep coming back to your purpose. Stray thoughts, like anything, are only a problem if you divert your energy to them and let them carry you away. This is no different to, say, if you are studying and you let the thought of going to watch TV instead carry you away!

POST: Beginner here. Is there a wikia style guide or an online source of encyclopedic knowledge that would be a good place for some one to start their journey?

Depends what you want. If you want rituals and mystery and so on, then you can immerse yourself in that. If you just want to get practical, then you can simplify things a bit. There are probably two sides: finding out about 'magickal practices' and then exploring 'the nature of reality' (which turns out to be about 'the nature of the self').

There's a free copy of Phil Hine's Condensed Chaos available here [\[Dead Link\]](#). Alan Chapman's Advanced Magick for Beginners is definitely worth your while. And perhaps a mix such as Magick on the Edge to give you a flavour of different people's approaches.

To explore about reality/yourself, you should consider looking into non-duality (e.g. Presence by Rupert Spira, The Direct Path by Greg Goode, the work of Douglas Harding.) It's a nice thing to be doing in parallel to any more esoteric stuff; keeps your perspective intact perhaps. If you're feeling daring, George Berkeley, or later authors, exploring things more philosophically.

Have fun.

POST: Anyone else feel like this when first beginning?

Q: First off, if anyone finds how I will be writing difficult to follow it is because I am trying to tie together several ideas at once to make a big idea, trying to pull a bit of my history and experiences together to let you know why I am trying to say what I am saying. Another way of looking at it is trying to describe in words (a limited thing) an intuitive knowing, which language is not the best at doing. Bear with me here... (and sorry if I irk any grammar nazis out there).

I feel like my ultimate goal, currently, is transcendence and the accrual of knowledge in order to try and find Truth, absolute Truth (or as close as I can get to It). I know there is so much more than this physical world we live in, and I want to ultimately experience that "outside" of my physical body and really outside of time itself (although I know it is possible to learn a bit of it while in this physical world with this physical body [as above, so below- looking deep within perhaps as another way], but not on the level that I want to experience it at).

I have several ways of looking at Magick, but I really fall in line and enjoy the R.A.W. outlook of it. He is the author that started it all for me and I agree (currently) with much of what he writes. My main go to for playing with 'reality' is through Chaos Magick and what little I know of it.

This is where it gets a bit confusing, because I can look at all of this from several ways. The two main ideas at the moment are 1)There is a physical world and legit "spiritual world", and magick is a way to bridge the gap and work in one to affect the other utilizing Universal Laws (think 'The Kybalion'), and 2) The Universe is a way for the infinite Source of everything to kind of do its thing and bridge out into infinity (as I understand it because I have to account for time in this Experience) through the experiences of consciousnesses (hard to describe...), and we are a part of it as it is a part of us. Our consciousness/Mind affects the reality we live in and perceive, and by changing the Mind (magick one way of doing this) we can change the reality and thus the Universe, and perhaps visa versa to some extent... Both of these could be true, or false (such as this physical existence is "it" and everything is just a result of chemical reactions within the body to to make and experience through what we call consciousness), or a mix... That is part of the Grand Mystery of it all.

One way of describing my trouble is that there are a lot of maps of the territory, and I can choose one to see a certain part of the terrain I want to see (Meta-programming), but the map is not the territory and I want to be able to SEE and KNOW the territory all at once (much like reading a map except the only real way to know the territory is to experience it, but I can only experience a little bit at a time and I am not sure if what I am experiencing is the REAL/TRUE terrain, or if it perverted because of the "instruments" i use to sense it).

For a bit of personal info, once i get out of my current career obligation (military), I plan on going into psychology and exploring the mind/reality aspects more deeply. I kind of lean more heavily toward this relationship to describe how "this" (this world, these experiences, the processes, etc) works.

I basically will follow a path till it leads me into a circle, which causes a lot of mental frustration, but then it tends to take me to a higher sense of understanding, only to go down a new path and repeat the process. A lot of this shit starts to 'break down' and fold into itself only to re-emerge out of itself, one way of describing it is as if you keep discovering/running into "reality koans" all over the place.

Logic only gets me so far, then it leads me to a state of intuitive knowing... but I want to be able to take this intuitive knowing and be able to but it into logical terms, which is the fucking HARD part, if possible at all. I mean, how can you absolutely describe infinity? It is impossible because you will always be describing it from within (yet you 'can' describe it as if from outside, kind of, but then we get back to the whole circles and koans bit....). Eventually, you can start to gain a deep intuitive knowing of it (enlightenment?), but then how can we put this knowing into words/symbols so others can know of it in in a minimalist way?

I hope this kind of makes a bit of sense to you. I wish I could just Matrix you what I know and feel so you could understand where it is I am coming from, but words only go so far in describing something of this magnitude.

RAW got me started: Quantum Psychology and Prometheus Rising. You can really overthink this though: it, of course, is actually super, super simple. The more you think about it, the more you will obscure it. You "are the dream, are consciousness" right now - you are just obscuring it by looking and thinking. There is no theory to this, it is not made of concepts and cannot be understood in that sense. It can be talked about, but really it is something you experience.

Do a daily practice like this:

- 10 minutes, twice a day.
- Lie down on the floor, feet flat with knees bent, head supported by books, arms by your side or hands resting on abdomen.
- Decide to give up completely to gravity: to "play dead".

- Let go of your body and mind, let them move as will. Allow them to unwind.
- Don't even "pay attention"; just let it be open and wide. If it focuses on some thought or pain briefly, let that happen, and let it open out again.
- After 10 minutes, decide to get up, but don't do anything about it. Wait until your body moves by itself. (Thus won't happen first time, but eventually it will happen.)

Basically, you are letting the "stuck thoughts" and "uncompleted movements" you have amassed unwind and dissolve themselves. You do not need to do anything for this to occur. Gradually, your perception will become clearer and clearer. Note: Any effort to focus or do anything will get in the way. There is a method of accelerating this by "overwriting yourself", but it's nicer this way.

...

Q: I feel like the objective truth is Inifity itself (the All-That-Is, God, etc). But, if this is the case, then it become a giant paradox due to spawning paradoxes all over the place. Infinity would say that nothing is true and that everything is true (or CHAOS and ORDER coexisting at 100% for both of them), but in our limited ability to understand the duality of this, we see that the two currently cannot exist at the same time, but they have to. We just don't know how, but we can make some damn good guesses, yet they will never really be 100%, because they will always be a part of the whole and not the whole itself. Hopefully you understand what I am trying to say :)

Perhaps chaos is enfolded into order, or vice versa?

Q: How many you's ARE there?
As I understand it, it can be an infinite amount. Depends on how far down the rabbit hole I want to take it.
How can an ego dissolve itself?

Not quite sure, but I feel it comes about from not having a need to protect the Self or a need to identify and separate the Self from the Whole. It dissolves from knowing that it is Infinity, but it is hard if not impossible to do when you are seeing all this from your individual conscious perspective. How can you describe infinity in its wholeness when you can only work from within it, never all of it unless you become all of it, and never from outside of it because there is nothing outside of it.
Some of the most basic thoughts are the 'craziest'...
And also some of the most True.

My thoughts:

The ego is just a mental thought that you (that is, consciousness) are having. You are infinite - you can "feel out" into space forever, right now, you will find - but you do have a perspective. There is no way to conceptualise this or intersubjectivity. You basically have to give up trying to work that out. The best way is to think of yourself as being All That Is, on a "time-share" basis. In moments when it is your turn, you are the whole thing.

Or for convenience, just treat this as a dream, where you are the dream. The bunch of body sensations in the middle you have tended to think of as "you", but they are within the larger consciousness (the actual you, the dream and the dreamer and the dreaming, same thing), you just got in the habit of misidentifying with that part of the dream experience.

You are an infinite self-aware blanket, which forms itself into the shapes of experiences, thereby experiencing itself. The blanket truth! [<https://youtu.be/XfiIRKLMjDY>]

Dunno what you've been reading, but I found certain things keep my sense of reality "loose". Read Rupert Spira and Greg Goode on non-duality. Read Advanced Magick for Beginners by Alan Chapman. Check out idealism [<https://www.bernardokastrup.com/>], and lucid dreaming (Robert Waggoner's book is great). Shake up your direct experience! :-)

Magick is just committed intention, and it always works in some way or other (even if it just results in a dream of your desire). If you can get into the mindset of expanding your a Will and Presence into the whole dream, you will find that helps.

POST: Occultism and Depression

Also, how does being an occultist change your approach to depression? Are you more likely to try to solve things yourself? Are you more likely to interpret the symptoms "esoterically"? And can you treat yourself "magickally" from the outset?

I wonder whether the sense of increased personal power can work beneficially and against too.

The seratonin-uptake model of depression is in doubt these days, for instance, and many depression medications have been criticised for being little more than placebo. If that's the case, then coming out of depression really is a work of magick (as in, intention and commitment, interpretation/declaration of an act as causal, rather than the nature of the act itself).

And 'consciousness-widening' acts might well loosen its hold?

I think this question is very relevant. I struggle with depression and often I lose interest in occult topics, stop reading, etc.
I'm not inclined to use psychiatric drugs to treat depression. I can understand OP's perspective that the drugs could be seen as magickal, but I'd be more inclined to use meditation and entheogenic approaches as a magickal treatment.
I think that being an occultist means having (or striving to have) an awareness of your inner state, and working to be able to alter that state in accordance with Will. So from my perspective, although depression can affect anyone, the primary difference with an occultist would be their way of viewing the depression, and perhaps an increased motivation to face and resolve the pain at the root of the depression with tactics of ritual, divination, meditation, etc. rather than with therapy/pharmaceuticals alone.

Hmm, yes. I think the occultist is better placed to do things such as experiment or understand their attention and their state and transform that.

Even simple things, like hypnosis/visualisation to "energise" oneself or change one's "mental posture" can be good. And an occultist is more likely to have developed the ability to "commit" to an act such as this. I think that having some sort of daily practice is more common for development generally, and might help depression too.

Another thought was: The occultist is likely to have long terms aims to succeed at this or that, and Will for particular results or life-changes in the future. This can help "keep life running" whilst depressed, if they can at least stick to that, because things have been set up in advance.

POST: Are you studying too much?

My thought: **keep purpose in mind**. It's lots of fun to read-about and explore and experiment, but you have to keep the balance between your outer life and your inner life. They are undivided and the same, and both need your attention so that they support one another. If you can tie your occult studies to definite outer aims, that can help. Why not combine your art with your magick? Whether that's summoning inspiration, or actually embedding magick into it. There's an infinite amount to "learn", but also nothing much to learn. Your life is just made up of experiences. At the moment you are choosing to experience "reading a lot" and "thinking about this topic a lot". Sometimes the implicit fantasy-dream element of magick can be a whole lot more attractive than the apparently mundane everyday life stuff, but: **The true purpose of practical magick is to summon/improve your experiences**, whether that's to clear out some misconceptions so that you have a clearer view of reality (inner), or to generate specific experiences you desire (outer). (Note: "experiences" includes "the experience of owning an object", etc.) So, decide what experiences you want to have, and start using magick to access them. If you don't do this, then you are reading and studying without focus - just for the wank of it basically - and that'll go on forever. All magickal traditions have the same underlying idea, because they are dealing with the same underlying universe. Be sure to read some stuff that tries to strip it back, such as Neville Goddard, Phil Hine or Alan Chapman. This just helps stop you getting too lost in the more fantastical elements (which do exist, but are not necessarily required). Having said all that, coming to your own personal "worldview" is very beneficial, whether that's "the world is a lucid dream, amongst many" or whether "we are but fragments of a turtle's shell". So that's one aim you can have when doing all your reading: synthesising your own approach and working out its implications for your real life.

TL;DR: Uh-huh, but **remember to live your life.**

TriumphantGeorge Compendium - Part 27

POST: I have a little bit of an emergency... Could use some perspective.

You are over-using and over-thinking, I think?

Possibly over thinking. Like, trying to hard to put meaning behind all of it.
Over use, though... Read what I pointed out to mysterymoth. I see no real difference between LBRP, prayer, chakra cleansing, etc., in so much as they both provide release of internal negative energy. I'm pretty sure that as long as it's not interfering with your everyday responsibilities, you can't really overuse LBRP.

Yeah, you're really searching for the meaning. As to LBRP, you just don't need it that much: a morning refresher, a calming in the evening, that's enough? But, hey, it depends a little on what system you're using. To me, it's just a "reset".

You sound like you've become a bit ungrounded. Do you do anything to keep your focus centred?

I do regular meditation which usually starts with some kind of banishing. I fluctuate between Chakra grounding and LBRP depending on what feels right at the time, and actually, up to this point, I was feeling pretty great about everything in general. That's part of why I was a bit startled by the dramatic shift in both external and internal environment for both me and my fiance. Do you do anything to keep you grounded that you wouldn't mind sharing? I'm always open to new ideas.

I don't do much: I do a lie-down-on-the-floor exercise twice a day, where I let go, expand out into the room, and "overwrite myself" with empty space. (I also then make sure my attention stays open and loosely centred either on my centreline - somewhat behind my eyes or lower abdomen - during the day.)

POST: the seemingly opposing view points in occultism

A1: all realities exist. you need to find the one that is relevant to you

Q1: I don't tend to believe this way. I think there is logical issues with it. If I have two view points that are saying total opposite things then one must be right and one must be either wrong or not totally correct. I believe there is an objective reality. So to say that you can have multiple realities is admitting that they are not actual realities. they might be subjective points of view but to be a reality it has to be anchored in objective truth.

A2: if your not willing to step outside of Aristotelian logic and apprehend paradox you wont get very far in occult studies.

*Q2: If the many worlds interpretation of QM is correct, then we do live in a multiverse, all possible realities do exist and you navigate a field of infinite potential futures with each choice you make.
All worlds being equally real and populated in each moment with minds as real as your own.
Before you scoff and say it is nonsense, the majority of physicists believe in the many worlds interpretation even Hawking.
[http://www.physics.wustl.edu/alford/many_worlds_FAQ.html]
[<http://www.quora.com/Why-do-60-of-theoretical-physicists-believe-in-the-many-worlds-theory>]
It is not a fringe view.
David Deutsch of Oxford has shown that the math of the many worlds interpretation checks out, and agrees with our observations.
[https://web.archive.org/web/20071121085925/http://www.breitbart.com/article.php?id=paUniverse_sun14_parallel_universes&show_article=1&cat=0]
The Oxford team, led by Dr David Deutsch, showed mathematically that the bush-like branching structure created by the universe splitting into parallel versions of itself can explain the probabilistic nature of quantum outcomes.*

I scoff and say "nonsense"! ;-)

Since we only live in one reality, this is effectively just story-making? If we never experience the branching, and only experience one sequence of choices, how does it help?

Except as a mathematical or diagrammatic 'aid' to describing or visualising probabilistic processes, but that doesn't correspond to there literally being multiple universes...surely?

*Q2: correspond to there literally being multiple universes...surely?
The earth was the center of the universe not to long ago, there is only one universe and only one version of you observing it today.*

I do take the point. However, the heliocentric alternative is something that could be tested and observed, there is no suggestion for how multiple-branching / many-world can be observed.

I'm all for alternative configurations / theories for the same data - having different 'stories' can provide real insight - but I don't think those two are in the same category, as I see it at the moment.

*Q2: Here is Geordie Rose founder of D-Wave, maker of the first proven quantum computer.
[<http://www.youtube.com/watch?v=MyUbWI8jPQU>]
Skip to the 4 minute mark.
He comes out and says they believe the many worlds interpretation is correct, and they are sharing processor resources between these many worlds.*

Thanks for that, will check it out when I get a moment.

Translation I have the attention span of a goldfish and will never watch it ever.

Right, just had a look: it's the David Deutsch quote.

Copenhagen interpretation, many-worlds view, they are reasonable attempts to account for - to provide a 'visualisation' for - the apparently probabilistic nature of quantum physics. However, there are alternatives: David Bohm's ideas, 'active information', extensions to the de Broglie pilot wave idea. In the end, as Bohr said: look, the maths works and is predictive, maybe you just have to put aside the notion that it's understandable. Many-worlds is just a placeholder for people who don't like the idea of a literal wavefunction collapsing into a single outcome.

Somewhat, much of this is a matter of taste.

Having said that, it's certainly fun to think about all this, and it can provide inspiration for things.

*Q2: Since you aren't going to watch it here is a transcript I took the time to type up, not that you will be bothered to read it.
There is a quote on screen from David Deutsch
"Quantum computation ...will be the first technology that allows useful tasks to be performed in collaboration between parallel universes."
David Deutsch @ TED 2005
3:57-4:27
This quote is from a respectable scientist in fact one of the founders of this field that may look a little strange to you who don't follow theoretical physics, but there is a very*

clear prediction that our most successful theory of nature makes and that is there are an enormous number, mind-boggling large number of parallel realities as real as this one that have different consistent histories

4:44

Quantum mechanics makes a very specific prediction that all of those (parallel universes with different histories) are as real as the thing that you remember

4:55

But science has reached the point now where we can build machines that exploit those other worlds and quantum computers are perhaps the most exciting of all of these

12:07-14:00 imagine that there really are parallel realities out there and imagine that you have two that are exactly identical in every respect all the way out to the horizon as far as we can see down to last little atomic detail of every single thing with only one difference and that is the value of a little thing called a qubit on this chip (contraction of quantum bit) and that qubit is very much like a bit or a transistor in a conventional computer it has two distinct physical states which we call zero and one per bit in a conventional computer these are mutually exclusive that device is either one or the other and never anything else. **In a quantum computer that device can be in the strange situation of where these two parallel universe have a nexus**, a point in space where they overlap and when you increase the number of these devices, **every time you add one of these qubits you double the number of the parallel universe you have access to** until such time you get to a chip like this which is about 500 of these bits you have something like two to the five hundredth power of these guys living in that chip **so the way I think about it is the shadows of these parallel worlds overlap with ours and if we are smart enough we can dive into them grab their resources and pull them back into ours to make an effect in our world now this may sound very odd to you and bizarre** and in fact I am using language that a normal theoretical physicist probably wouldn't use, but this is **what I am telling you is absolutely correct and in line with the way these things actually work.**

Thanks for your effort, I appreciate it.

Seeing it earlier triggered a memory of a profile I'd read on Deutch a few years back. Tracked it down to here. You might find it a good read if you've not already seen it. It's pretty balanced; it's the New Yorker and so doesn't gave an agenda!

There's a good quote:

The strangeness of superposition is, as Deutsch explains it, simply “the phenomenon of physical variables having different values in different universes.” And entanglement, which so bothered Einstein and others, especially for its implication that particles could instantly communicate regardless of their distance in space or time, is also resolved. Information that seemed to travel faster than the speed of light and along no detectable pathway—spookily transmitted as if via E.S.P.—can, in Many Worlds theory, be understood to move differently. Information still spreads through direct contact—the “ordinary” way; it’s just that we need to adjust to that contact being via the tangencies of abutting universes. As a further bonus, in Many Worlds theory randomness goes away, too.

And this gets to the heart of it. The Many Worlds theory is a way to get back to determinism for people who don't like the 'randomness' and, most importantly, that a system can hold itself multiple states at once, and multiples of multiple states at once.

It provides a 'picture-able' approach to the problem, rather than being left with the raw maths. It's a cool way to imagine it, but it seems clumsy to think that it is really happening as described. Inelegant. Nothing wrong with that, but to take it literally is not I think useful. I suspect a better view will be invented eventually.

But if it works then that is fine. The history of physics is filled with ideas that worked, led to new insights, but were then discovered to be kinda-wrong of just 'useful fictions', and on we go (see Paul Feyerabend [https://en.wikipedia.org/wiki/Against_Method] for fun on that).

The problem with quantum mechanics is that the maths works but there are several different interpretations, all leading to the same result, so it's hard to distinguish between them, except by preference. Seemingly opposing views which, in terms of result, aren't really opposed. They all work.

I don't have a problem with 'multiple states' that collapse on observation, so Many Worlds just seems like a bit of fun. I quite like the idea that it's the whole environment that collapses the state. But there you go.

It's a great topic though.

Final quote:

An example of the agnostic view is given by Carl Friedrich von Weizsäcker, who, while participating in a colloquium at Cambridge, denied that the Copenhagen interpretation asserted "What cannot be observed does not exist." He suggested instead that the Copenhagen interpretation follows the principle "What is observed certainly exists; about what is not observed we are still free to make suitable assumptions. We use that freedom to avoid paradoxes."

Q2: *Thanks for your effort, I appreciate it.*
You appreciate something you couldn't be bothered to read.
Right...

Um, I did read it, and then I took the time to respond thoughtfully.

Let me say: this isn't news to me. I studied this stuff. Did you read my response? The New Yorker article is pretty accessible to the non-scientist. The Many Worlds view is an interpretation. Amongst others. Most physicists just don't care much. Most don't agree.

There's not much to separate the idea of 'Many States, all of which contribute, only one of which you observe' from 'Many Worlds, all of which contribute, only one of which you live in'.

There are silly reasons to reject Many Worlds (this [<https://www.preposterousuniverse.com/blog/2014/06/30/why-the-many-worlds-formulation-of-quantum-mechanics-is-probably-correct/>] is a good article covering that), but when you examine it you find that the 'worlds' idea itself doesn't really make much of a difference to people's actually work in detail; really it's just 'states'. (But there's nothing wrong in that as such.)

You might find this interview interesting reading [[deleted](#)]. Just came across it. Both a physics and philosophical angle. Anyway, check it out.

Q2: *The thing is George, Let's say we prove without a shadow of a doubt that there are parallel universes and they very weakly interact via gravity, and we enable communication between ours and another. No one would ever believe it even with proof. It takes an army and a revolution to change paradigms.*

Point well made. Generally I am happy to go with usefulness of concepts while being aware that I am doing this. Of course, we are never at "the end of history" and recognising this is quite freeing.

For this, I think we can operate more directly, conceptually.

...

A1: *so you are saying some of it is bullshit, whereas scientific research says all of it is all bullshit*
you might have problems making progress with that view

Q3: *I mean sure I am saying somethings are not true. Unless you expect me to believe everything I hear which is just silly. Scientific research has nothing to say about it they often are not capable of measuring anything or devising experiments to test claims of an occult or spiritual nature. Now as human beings they may be saying it's bullshit but that isn't really fair and not in the spirit of science. If they cannot measure it or test it they should say nothing until they can approach it experimentally or disprove it mathematically which they have not been able to do.*

Q4: *Scientific research has nothing to say about it*
Yes sir it does.
they often are not capable of measuring anything or devising experiments to test claims of an occult or spiritual nature.

Sure they are. The entire point of me being here is to find people who want something real, and showing them the best scientific evidence to support it.
If they cannot measure it or test it
Of course they can and have.

One key thing: Many good results are "life results", as in they are personally meaningful but are one-offs and can be explained away as coincidences with a describable chain of events. Most useful magick - or I mean, the magick most people are seeking in the end - probably isn't of the psi / spontaneous materialisations / researchable kind. It all falls within the normal laws of physics.

Not many people seem to be deliberately pushing for something more than this.

Q4: One key thing: Many good results are "life results", as in they are personally meaningful but are one-offs and can be explained away as coincidences with a describable chain of events.
You are debating in a vacuum, as you don't now what it is I am referring to.
What I am referring to is something real you can quantify and objectively demonstrate.
Most useful magick - or I mean, the magick most people are seeking in the end - probably isn't
Drawing sigils, chanting incantations, performing rituals, making seals, making potions, visualization, all of that nonsense is make believe.
It is only useful as entertainment.
Not many people seem to be deliberately pushing for something more than this.
There are maybe 5 people on the entire internet that I am aware of pushing for something more.

This brushes most "magick" aside, as generally conceived and practiced, which is fine. It is impossible to test objectively, it is subjective experience by its nature.

What can we quantify and objectively demonstrate at present? Or what can we aim to in future?

If you can't test it objectively it is make believe nonsense or spiritual roleplaying. What I am talking about is something real you can demonstrate.

The problem is, we are reducing the scope of what is real to what is repeatable within very limited constraints. One-hit results, for instance, aren't testable by those methods. We can't say they aren't real, just that they don't fall within the parameters that allow us to examine the phenomena; they can't be proved by those methods. There are some things you can only test for yourself.

Lucid dreaming, for instance. Now there is lab work done with that, but for the longest time that was dismissed, because it is very much a subjective experience, and even now it is argued that it is an imagined state.

Let me be clear: The fact I'm saying that some phenomena might be excluded from this approach doesn't mean, a) That I believe all these things exist or are as described and, b) That I don't think efforts using those methods to explore phenomena that do fall within their scope should not be pursued to the fullest.

Anecdotes aren't evidence, but they are personal data.

Not something I discuss in pubic.

Oh, give me a hint. It'll make all the difference! :-)

Q4: The problem is, we are reducing the scope of what is real
It isn't so complicated. How many millions of people chase magick and occult bullshit daily? How many people are rich as a result of it?
That says plenty right there.
Sure there are plenty of famous authors, and maybe they make money selling bullshit to people who are willing to pay to read bullshit, but other than their fame among a group of sad delusional idiots they have nothing to show for their efforts.
Oh, give me a hint. It'll make all the difference! :-)
No.

Yeah, it's not "movie magick" and anyone expecting that is in for a shock, but who really pushes that idea except a few very populist Chopra-like authors anyway?

Most people who aren't fantasists and have experimented would say that it simply smooths the way via increased fortuitousness, sometimes absolutely ridiculously so. And that it's hard to tell the difference between chance and cause, but that the 'unlikeliness' and personally meaningful aspects of the experience make an impression, and seems repeatable as a phenomenon, but not controllable as a science.

No.

Aw, no fun! ;-)

Q4: imply smooths the way via increased fortuitousness, sometimes absolutely ridiculously so. And that it's hard to tell the difference between chance and cause, but that the 'unlikeliness' and personally meaningful aspects of the experience make an impression, and seems repeatable as a phenomenon, but not controllable as a science.
Translation, it's a game of spiritual roleplay and make believe.

The role-play is optional. It's simply intention and direction. But nobody should take anybody's word for these things - they have to experiment themselves, be brutally honest, and come to their own conclusions. It's a subjective experience, but also can be a shared subjective experience.

If I had to describe it, I'd say that - yes, basically magick as described isn't real - but the world does have a 'clumpiness' to it, and correlation and causation are muddled here. Someone's "ritual" doesn't cause anything, however the ritual and whatever-the-apparent-result both arise from the same place.

That sounded a bit 'woo', really what I'm getting at is that it can be seen as part of a single movement (see Wholeness and the Implicate Order or similar), so it's not surprising that events should arise in patterns - our actions and thoughts also being events - and that we might attribute direct causality where there is none. The unfolded events were enfolded together. This doesn't matter in terms of the apparent results, or their usefulness.

(This of course has implications for free will.)

But, y'know, I'm not really an advocate, I just find it interesting to think and explore, and a spot of experimentation does show some curious effects.

[QUOTE]

Wholeness and the Implicate Order:
Wholeness and the Implicate Order is a book by theoretical physicist David Bohm. It was originally published 1980 by Routledge, Great Britain.
The book is considered a basic reference for Bohm's concepts of undivided wholeness and of implicate and explicate orders, as well as of Bohm's rheomode. The book is cited,
for example, by philosopher Steven M. Rosen in his book The Self-evolving Cosmos, by mathematician and theologian Kevin J. Sharpe in his book David Bohm's World, by theologian Joseph P. Farrell in Babylon's Banksters, and by theologian John C. Polkinghorne in his book One World.

[END OF QUOTE]

Drawing sigils on paper, performing rituals, chanting incantations, and all of the other nonsense.

Oh, I agree with you on that. None of those acts do anything. Any results are coincidental (in the literal sense of coinciding) and were not caused by those acts. There is some skew, but most ain't true. But one can obtain effects. Experimenting there and moving along is one way to make progress.

For all the millions of newagers, occultists, or whatever, the few who seem to make progress sure seem to keep their mouths shut about it.

Well, most people are just talk, they're enjoying "the thing of it". They're doing it wrong, or they're not really doing anything at all, and they're looking in the wrong direction anyway. But why does it continue? Because they get a taste of something, just enough.

Q4: You got my meaning, they aren't presenting any good evidence their practices are giving any results other than how they make them feel emotionally. they're enjoying "the thing of it". They are roleplaying, it is a game of spiritual make believe, it's purpose is spiritual entertainment.

Yeah, it's about the "zing" for many, and for most it's just a personal thing, Baader-Meinhof or not [https://www.damninteresting.com/the-baader-meinhof-phenomenon/]. That is not to dismiss it all, however. Baby and bathwater.

EDIT: I don't know that it's "spiritual entertainment" though, it's the excitement of there being a deeper reality, something 'more than is here', and the possibility of exerting control over what previously seemed uncontrollable.

Q4: EDIT: I don't know that it's "spiritual entertainment" though, it's the excitement of there being a deeper reality, something 'more than is here', and the possibility of exerting control over what previously seemed uncontrollable. Obviously they aren't in a deeper reality, exerting control over the uncontrollable, etc. Otherwise they would be getting some results. Either that or they keep their mouths shut real well. Either you get results you can display in a lab or you don't. Either you have objective evidence to ground your beliefs in or you don't. It's that simple.

This is the attraction though, for people.

But: The results that one can display in a lab are a particular subset of possible results, and probably not the result people into this are seeking. That's why people won't bite on the whole evidence thing. They're not interesting in affecting instruments and so on, or even localised control of themselves at all. They want that job interview to go successfully, that person to show up, that object they like to appear. Some are interested in pushing a bit further, bending things a little more, in a direct-reality way, but not many. The idea of that being possible has fallen away over time.

Meanwhile, you can do awareness training and direct influence work with much practice, but that's a different sort of effort, and not something most people would find an attractive way to spend their time. Not "wizardly" enough! :-)

Most people aren't really "here" much in the first place, and that's the place to start.

So I have heard no tales of anyone's magick affecting their lives any more than prayer.

Exactly right. There's a whole book on that technique, actually.

"You can do awareness training and direct influence work with much practice." Results there are none. None.

Those results are martial arts skills if so desired, the various benefits of Qigong, and a clarity of awareness without the usual perceptual boundaries. But that's all another thing. The only way to get real results is by direct presence and intention. This need not be local, however.

"There's a whole book on that technique, actually." Listen I could create a fake pantheon and teach it to ignorant children living in isolation...

Um, so that was a joke actually.

It's simple: You develop direct access to your extended underlying experience, you intend directly, you get results. You might need to clear a few things away beforehand if you've been messing around with other conceptual frameworks, but that's it. The mechanism or representation is irrelevant. There's no energy to play with, no servitors, no symbols, etc, other than as experiential crutches or routes. I've played with them all, and they're just additional forms.

Anyone promising a secret path or new knowledge is just adding to the layers of obfuscation.

Q4: Um, so that was a joke actually. It's simple: You develop direct access to your extended underlying experience, you intend directly, you get results. You might need to clear a few things away beforehand if you've been messing around with other conceptual frameworks, but that's it. The mechanism or representation is irrelevant. There's no energy to play with, no servitors, no symbols, etc, other than as experiential crutches or routes. I've played with them all, and they're just additional forms. You make things way more complicated than necessary. You listen to those people who get results and you ignore everyone who doesn't. That simple. You come back and lecture on why whatever method you think works, works when you have some evidence to back that up. Anyone promising a secret path or new knowledge is just adding to the layers of obfuscation. Unless they can offer good hard objective evidence they get some results...

You seem to be having an argument with someone who isn't having an argument with you. Your tone is well out of order and there's no excuse for it in a constructive exchange.

Nobody was lecturing you. I apologise if I came across that way, it was unintended, on re-reading it did sound preachy, but I was just summarising my position.

That is my technique and it works well within its parameters. It also appears to be the basis for other techniques when they work. If there are alternatives, I'm interested; I'm not bound to any one approach and don't identify with any technique. As far as I'm concerned, any discoveries and progress are all good.

To be honest you might be a nice guy, but I am not interested in your opinion unless you have some evidence that is convincing.

That's better. There's no excuse not to be civil. :-)

I'm not really interested in getting into evidence-exchange though, it's just a slog with little reward (in my experience) - just like most conversations about it eh.

There are already studies out there that cover the basic lab stuff, and anything more extended doesn't fit easily into a small study, is expensive to set up, and unpleasant to be involved in - so has to remain in the 'unproven' box as far as a global skeptic audience is concerned. (For now.)

My apologies. I am just burnt out from arguing with people non stop. I guess you are just trying to have a civil discussion.

No worries. It's not always easy to have conversations on these topics and on these forums: people either don't want to listen, or they don't want to talk! :-)

Take it easy.

POST: Can we get a synchronicity thread going?

/r/synchronicities covers this but can descend into just 'hey, two things happened'. If we could have a thread that ups the quality - i.e. meaningful coincidences that seem like messages - then this could be worth having.

Not "I bought a red bicycle and now I see lots of red bicycles".

Q: At the risk of sounding like a jerk, those are some pretty tame "synchronicities" that I would tend to just call coincidences. To me, a synchronicity is when something happens that is meaningfully related to something relevant to your life (whether a dream, emotional situation, dilemma, etc.), and is so clearly significant that it almost feels like a message, of which the meaning is easily interpreted.
Example: While struggling with disease, a young man dreams that his hair has turned completely white (in Eastern cultures, white is the color of death). The next day he receives a surprise birthday gift: A white rabbit! Years later, the man succumbs to his disease, and just few hours after him, the rabbit dies too.

Yeah, they are meant to be personally meaningful coincidences rather than just coincidences, and sometimes things really ramp up at key moments.

For instance, when I was in a particularly tight spot I went for some coffee in a cafe and at the table opposite me two random guys started talking about the exact situation I was in, about a friend of theirs, and what he should do and what he should watch out for.

I'd made a few mistakes and ignored some synchronicities, and bit by bit the universe started screaming at me it seemed, giving me multiple escape options and advice. This eventually ended with having an absolute gravitational pull that I just had to meet a certain person at a certain place that night, or else.

POST: Solipsism... this thread needs to happen

Doesn't really matter. The sense in which "there is only you" isn't in the same sense that you would say "there is only cosmicprankster420", because "cosmicprankster420" is illusory (just a bunch of bodily sensations and thoughts floating in space) - a 'dream character', basically - as is everyone else (just images and touch sensations).

The real "you" is the awareness that experiences "cosmicprankster420" and it turns out that this awareness can't be divided; everything emerges from it and is of it. Everything you experience is an aspect of you. It's only in that sense that you are all there is.

Practically speaking then, that means you (the apparent individual) should treat everyone else as part of yourself. Which is a pretty good way to treat people anyway: with compassion. In fact, it might be a better worldview to have for behaviour.

(Being selfish is okay when it's the capital-S version of Self.)

POST: Is this legit?

Q1: This is from a documentary named "Verbotene Aufnahmen" and it was aired on the German TV-Channel "ARTE". It is supposed to be fake and is on purpose filmed like that. A french guy directed the whole thing. As a kid I really loved watching this documentary, because it was somehow mysterious and scary. For everyone out there understanding German or French, watch it!
German Wiki:
http://de.wikipedia.org/wiki/Verbotene_Aufnahmen
Original Title:
[\[http://www.imdb.com/title/tt0258528/\]](http://www.imdb.com/title/tt0258528/)
Full Video:
[\[https://www.youtube.com/watch?v=JPuplkjzpN8\]](https://www.youtube.com/watch?v=JPuplkjzpN8) - German
[\[http://youtu.be/5TOFD-pElhg\]](http://youtu.be/5TOFD-pElhg) - French

Q2: Thanks. For lack of not knowing german, what is it about?

Translation from the German wiki:

Forbidden photographs
Forbidden photographs (franz. Original title: Les of document interdits) short film series of the French director are Jean teddy Filippe.
Those altogether twelve films with a length between 4 and 13 minutes are in the style of amateur photographs and treat together all puzzling, amazing or inexplicable phenomena and things, for example humans supernatural Abilities. The films developed in the year 1989 and fictitiously, are to arouse the impression however that it concerns material, together-collected amateur photographs, which are commentated by a speaker documentarily and dramatisierend. The most different time epochs are processed, for example 1940er years, 1980er years.
The Erstaussstrahlung on the German television took place via the transmitter arte. There some the Kurzfilme not as obvious falsification to recognize are, these of few persons as genuine are not regarded, what also the intention of the director was.
See also:
Mockumentary [<https://en.wikipedia.org/wiki/Mockumentary>], Pseudo documentation

So, it's a bit of fun really. As an early instance of the "fake found footage" genre, the films supposedly inspired the movies [REC], Blair Witch Project and Paranormal Activity. Good article here:

Filippe make no serious attempt to get us to believe his films are real, but simply launches freely into the pleasure of the hoax, tweaking and suggesting just enough, and taking joy in exploring and exploiting restraint rather than the overt excess that invades so many later “found footage” films. Some, like Siberia are in fact fairly dull, but even in that lies a certain charm, as though we’re watching a classified instructional film that makes to pretense at asking for our interest or offering sordid details; the ordinary looking “cyborg” getting his arm trapped in a window isn’t much of a story and Filippe knows that the trick is not trying to turn it into one.

And here is that particular show described:

Ghosts (8'33) : Guided by his mexican friend y, x goes hiking to be presented to " The Nameless Ones " , entities living in the desert and able to move instantly from one point to another.

POST: The question is not "Which god created the world?", it's "Which god created YOUR world?"

I created my world, including the character of "TriumphantGeorge", which I later confused myself with, forgetting that I was the whole world, and not just that named part of it. You are your God.

I'm having some trouble reconcing the ideas of "pride is bad" and "I am god".

Who says pride is bad? And who said "I am God" is something to be proud of? Are you proud of being a person? Or of being the gender you are? You can't be proud of facts!

You just use facts.

Pride is the greatest of the opposing forces within us. It causes our anger, jealousy, greed etc. but the way you explain it, I think I get how to view it.

Yes. Pride is bad in the sense that we can end up not doing things because it involves actions which are against who we think we are as a person. But we are not really that person, so that is to make decisions based on a "false self". "I am God" is a way of pointing to your true nature, which cannot be prideful if you understand it properly.

I may just read too much fantasy, but when a prideful person achieves godhood, it never ends well. I'd rather get over myself before I put myself over everything.

Well, what saves you is: **A prideful person never achieves the recognition of Godhood**, because you have to get over yourself (your 'small self') in order to do this. Seeing yourself as "everything", or an undivided part of "everything", means you have to let go of that individual sense.

There is a concept in the New Thought movement which sorta goes "Your image of God is what you become." Kinda similar to this. Personally, I can't choose one deity that created my world because it changes often. But today, a chthonic earth goddess of some sort feels appropo. Thanks for asking.

"**The world is yourself pushed out**", says Neville Goddard for instance.

POST: Are sigils with built-in time constraints doomed to fail?

AI: In my experience, Magic generally works in a way consistent with the thoughts of the caster. If you subconsciously expect time constraints to hinder the work, they will. This seems to function with a feedback loop, the results tend to reinforce your thoughts about how Magic works/doesn't work. The initial thoughts about how Magic should work usually originate with literature and film exposure, as well as the opinions of nurturing influences (parents, relatives, friends). Preprogrammed and reinforced limitations can be overcome by study, analysis, and meditation. You must reprogram the subconscious by answering the question of "What beliefs do I have which cause me to think time constraints cause sigils to fail?" and deeply analyzing "What do I know about magic which indicates time constraints should not be a problem?" For example, many people program themselves by adopting idioms/memes such as: "No such thing as a free meal." "Everything happens in its own time." "Nothing in life is easy." "In due time." And so their experiences will manifest consistent with the idioms they've programmed themselves to accept as true. If you believe everything happens in its own time, then you're swimming up a river when specifying a time because you don't actually believe you're capable of changing when things happen. So you have to ask questions like "Why do I think things happen in their own time? Who told me that and why did I adopt that statement as true? Who/What determines when something's time is?" A person with a strong belief in scientific materialism will find that beliefs about a strictly causal universe interfere with temporal determination. If one believes the past determines the future, then things can only happen when a prior event leads causally towards a future event.

What a great response. It's also worth experimenting with 'impossible things' that aren't impossible - e.g. seeing with your eyes closed (see here [Darkroom Vision & Chef Hats & Dreams]), it can be done because what you're seeing right now is a dream or constantly-updating-memory 'inspired by the senses', at best). The idea being that visceral experiences that are counterintuitive can loosen the hold of constraints and open you up. Anything that can change your feeling from being "this is a solid, material place" to something a bit more flexible, will be helpful. Also, check out Alan Chapman's Advanced Magick for Beginners, which pretty much encapsulated the "how this works is how I think this works" view of magick, especially sigils.

...

Q1: My theory is that sigils work the way the caster thinks. Like, if you were a sigil, how would you get your caster what they wanted? That's how it'll work.

Q2: Be careful about assuming that. You never know if you'll come into a lot of money because your dad got hit by a bus.

You can specify against that. That sort of thing only happens if you quietly don't want things to go nicely, think that there is a price to pay, etc.

"The harvest was indeed plentiful that year, because half of the population was killed by the plague. And the sharknado."

POST: Is a Creator necessary?

There is "God" and there is God - ?

- "God" is an entity who can be called upon, one of many.
- God is the universe itself, the conscious space in which all experience arises, and is made from. He is not an entity, he is first-cause, the larger Self from which your 'self' appears, and is a fragment. You have no power other than the power of God, for you are he and he is you. You are moved by his Will, which is your True Will, although you can equally intend from the perspective of your self, against this, to a limited extent.

/r/Pantheism much, yessss?

More idealism, I'd say: Consciousness is fundamental; everything, all content, is patterns in and of consciousness.

Rocks, having no complexity, are not self-conscious, but they are made of consciousness. Humans are also made of consciousness but, having complexity, are self-conscious because they can attend to concepts within themselves, including a concept of 'self'.

It seems like you could take your use of "consciousness" and swap it out for "energy." If you've got an explanation for why the universe would have to be conscious, I'd be interested to hear it.

No, they can't be swapped. If at some point you want to move from the start of the universe to a person that can be aware of things, and have 'self' awareness, consciousness has to "emerge" somewhere.

If the material of the universe is inherently conscious, then this isn't a problem. Note, this doesn't mean that everything is thinking! Rather, it means that a certain region is aware of the patterns within its boundary.

For instance, your nervous system is aware of the contents of your nervous system, including "thoughts" (shadow sensations), but cannot be aware of itself (as in, its own boundary). Self-consciousness for humans is: a feeling of being aware (this is inherent), and an awareness of a thought of oneself (which appears within the boundary).

The Metaphor of the Blanket

Imagine a blanket. The blanket is "aware". But laid out flat, there is just "openness", no structure, no content to be aware of. Now, the blanket folds itself, creases itself. The blanket is now aware of the structure within itself, relative to itself: one side of the fold relative to the other. It is in this sense that consciousness (or "awareness", to escape from some of the baggage attached to the c-word) is fundamental, and this is how it becomes "aware of" something, of content, formed from itself.

The brain is a very complex area of blanket (whose pattern border marks the limit of our personal experience), which is part of a larger blanket (the universe).

(An alternative metaphor is whirlpools in a stream: everything is made from water, whirlpools represents patterned regions such as brains which are aware of the structure within themselves.)

It seems to me that "emergent" consciousness as a result of complexity of the nervous system (in the same way that enzymes have emergent functionality as a result of their structure versus other assemblies of matter) is a lot easier to explain than consciousness as an inherent principle to the universe. From a purely material view, I can agree that the capacity for consciousness exists in the universe (in the same way that the capacity for television exists - the matter and energy that compose the universe make it possible), but I don't see it as an underlying force or inherent principle (like strong and weak nuclear, and all that jazz). Unfortunately, that's us drawing different conclusions from the same set of data, so I doubt either one is going to change the other's mind. That being said, that's far and away the best explanation I've seen of the idea and how it works, which I really appreciate (all the previous discussions I've had about it quickly descend into "because I said so" territory). Thanks!

I'm pretty open minded! The problem is, that the personal experience of consciousness is hard to reconcile with the "emergent" view. You end up with questions such as, where in the brain does consciousness begin and end, at what point does something get complex enough to be conscious, and so on. It's not an underlying force, or that sort of thing, but it needs to be a pre-existing property of some sort. Awareness is a better word than consciousness for this basic property though. I've not come up with anything better than this version of 'idealism + nonduality', so far.

Of course, these questions have been around for a long time!

Another way of thinking about it: Imagine that the blanket is made up from eyes. Laid flat, the eyes perceive nothing, the blanket is not aware of anything. The eyes are "aware", but not aware of anything. With the blanket having folds and creases, however, the eyes see the themselves; consciousness-of the pattern of the folds and self-consciousness can arise.

Yeah, I don't see this as being resolved any time soon. :-) Cheers.

...

That's quite nice. Quite a few folk - physicist David Bohm for instance with his quantum potential, implicate order, and active information - go for something akin to a mind-like and matter-like combination of aspects. My take is that you don't need the matter aspect (and who's heard a decent definition of matter lately?) if you re-introduce it as a self-referencing pattern of the mind aspect.

Rocks and the like aren't self-aware or conscious exactly but they have a relationship to their surroundings that's relatively static so they can function effectively as a kind of memory.

That's a nice way to put it. I'd say that rocks are "static memory" or rather - since they do change - very slowly-changing memory. We, on the other hand, are "dynamic" or very fast-unfolding memory.

Constantly unfolding, changing patterns in a background - everything is its own memory.

The fact that we're conscious is definitely a byproduct of the nature of the world around us. You might think this sounds like the materialist perspective.

I agree with that. Materialism and idealism are basically the same thing, with a new level inserted at the base: consciousness or awareness as the basic no-thing "non-stuff" from which things ("actual-stuff") arise as patterns. That's it. Basically, it introduces a mind-aspect by saying that the mind-aspect is the basic reality; a matter-aspect follows as patterns within the mind-aspect, which subsequently at an advanced level leads to patterns which are aware of their own content patterns.

1. There is a background (like water).
2. Things we experience are patterns arising and unfolding in that background (like ripples).

As always, the important point is that the background when undisturbed isn't conscious - which people use to mean conscious-of - it is consciousness. It is only conscious-of when there is a pattern within itself. Like a rock. Or a brain.

POST: How can I do this Magick stuff when I can’t visualize? | The Gates of Horn

This is spot on. Visualisation - and seeing - isn't about the location of the picture or the target, it's about where you see from: where you centre and rest your attention, where you 'look out from'.

Ignore the hosting website, but check out this article [<http://www.reptilianagenda.com/brain/br121804d.shtml>] on 'seeing from the core':

Another student called me the other day and said, “When I remember the quiet place inside my head, it really improves my vision.” It gives one a little sense of distance from the eyes, a sense of space, so that one can sit back, so to speak, and receive the images. This prevents the habit of straining. We are giving the eyes the opportunity to move freely and see, just as Bates said. Sometimes it’s the acuity that sharpens; sometimes it’s the visual field that expands and sometimes it’s the double images that resolve into one.

EDIT: I'd add that visualisation doesn't matter for magick though. It's really about located presence and intention, and the picturing aspect can be incidental to that. The important bit is to realise the difference between thinking-about and being-at.

POST: Dream magic question - how to?

Enter his dream directly?

- Relax and get ready for sleep.
- Wait for your body to release and enter a calm state.
- Wait for "the sparkles", which then turn into image fragments.
- At this point, decide that you are going to enter the dream of this person that night.
- Remain conscious as the fragments gradually coalesce into an environment.
- Mentally step into the dream environment.
- Go looking for him.

POST: Reading Robert Bruce's "Astral Dynamics" -- Why does he describe the astral plane(s) as nonphysical?

The vibrations thing can be confusing, but it's just a metaphor. Science itself is a bunch of metaphors, however they are specifically tied to particular observations, and have been felt out over time to find the best ones. You could also talk about "tuning into to levels", etc. Read the OBE/LD books (Robert Bruce, Robert Munroe, Oliver Fox, Robert Waggoner - all the Bobs!) for the reported experiences and the techniques. Reserve judgement on the "what it really means or how it really works" until you've had a chance to explore the phenomena yourself.

Metaphors don't mean much without the experience, and then they are obvious. That's why reading "non-dual" literature is so frustrating, for instance.

TL;DR: What are experiences made from? Experiencing. What are explanations made from? Thoughts. What are thoughts made from? They are made from thinking. What is thinking? An experience...

curious about your reading of the rest of chapman [http://www.reddit.com/r/OccultStudyGroup/comments/2mnogq/reading_group_advanced_magick_for_beginners_start/]

I'm in. I have read it and I often recommend it to people - and the shorter, snappier version (The Camel Rides Again) - but actually it's been awhile. I probably have quite a different way of seeing things now than I did at the time.

...

notfancy: You know the New Age penchant for misappropriating and mangling quantum mechanical concepts? Turns out the tradition goes back to the Victorian Spiritualists and Theosophists besotted with Maxwell's theories of radiation. The appropriation of ready-made, mostly opaque (or black-box) physical concepts works as generative metaphors to put into words concepts completely alien to the base or imported concept but having more or less isomorphous relations to one another. For instance, as you increase geometrical dimensions you quickly find room for more and more strange and complicated mathematical objects, so in Theosophical parlance dimensions are organizing conceptual "planes" (another metaphor) vertically stacked in ascending order of abstraction, purity or rarefaction. In the same way that electromagnetic waves of higher frequencies represent radio waves, microwaves, infrared, the visible colors from red to violet and so on and so forth, Theosophical "vibration" or "frequency" represent higher "colors" or "tonalities" (here the metaphor is Pythagorean and certainly of ancient coinage) in a harmonious ascending scale of some positive quality: "energy" properly as the abstract capacity to effect change, "evolution" (another appropriation, this time from Darwin), "consciousness", et cetera. This unfortunately means that, as a newcomer to the field, you have two potentially difficult prerequisites to fulfill: one is learning the specific Theosophical, New Thought and/or New Age vocabulary used by the book, and two is keeping it all in a separate compartment from those concepts with the same name that you know from your Science education.

Edit: before you cry foul consider that usual Physical words like "energy", "current", "potential", "force", "quantum" are all metaphors. Not the denotations themselves, those are precise, but the denoting words were all appropriated from previous base meanings and coopted for specific new ones. Physics in particular and Science in general have no claim of exclusivity to their words.

I know it's been a while, but can you tell me what meaning is intended by metaphorical super-high frequency vibrations? Like, if scientific parlance is the vehicle, what is the actual nature of the tenor?

notfancy: Frequency of vibration is a scale to measure the evolution of the gross into the subtle, and in that respect it is a value judgement: low is bad, high is good, with the resulting metaphors of descent or fall and ascent or redemption and so on.

POST: You can't have anything you need.

[POST]

I've recently learned this myself. If i need something, i can't have it. Anyone know any books on this philosophy?

[END OF POST]

*NeedPan: As you can see I need pan and have plenty!
Care to be more specific?
Do you mean what you must for you cannot easily obtain? Do you mean what you're looking for you won't find?
Sounds depressing*

Q: Correct me if I am wrong, but I think what OP is saying is that when you say you "need" something, then the universe, kia, subconscious, whatever... it takes that as a statement of truth and manifests it into "reality". I think that you, NeedPan, are hinting at this idea, lust of result... again, correct me if I'm wrong.

*NeedPan: yeah of course! that's really psychical of you because the words "lust of result" were spiraling in my head I just didn't bring it up in need of further clarification before citing Crowley but..
TIL that's part of the bedrock of (atleast) practical magick? No, it's also the bedrock of material/emotional/spiritual experience. The way that the human brain thinks it can accomplish something from a position of 'need/want'...
It's like the Inception part about life. It's the fact that we are experiencing what our subconscious expects us to. If we wish to alter the current status of our perceived reality we must begin to assume the state required. You can re-orient your thoughts and musing around the concept of being at-one with the energies you wish to merge with. The only way to do it is to do it.
So I ask OP: What would, or to take it a step father, what DOES it FEEL like to get what you need? That one day you knew you had exactly what you needed, didn't it feel great?
Very specific requests require very specific energies. Study the energy and merge!
Gods, Goddesses and archetypes I believe are part of the stepping stone to helping usher in the energy one might feel they've never before possessed. One good practice would be to find out who/what harbors what it is you need/want and attempt to invoke their vital energies while knowing you have inside you what it is you'll wish to experience materialized in the future.*

If you go about deciding to want/need something, your wish is granted: you get to want/need it. If you decide you already have it, then you get that. Feeling is the secret, apparently. (Seriously: developing "feeling-awareness" is key to magick in general.)

People often do a sigil and say "I want to have a nice car". The sigil then gives them the experience of wanting, just as they requested! If they say "I will have a nice car", then that's different. Unfortunately, the default position people have is the feeling of "desire" which they refuse to let go of, or try to manipulate - even though letting go of desire is the only way for it to move location from here (the internal world) to there (the external).

EDIT: Assume the state, as /u/NeedPan says!

POST: They say practice magick every day

[POST]

==I don't know what to do besides performing rituals to manifest my will, aka mostly sigil magick. What other stuff is there for me to do in my garage/temple? ==

[END OF POST]

Explore the nature of your direct experience.

could you elaborate?

Of course.

Instead of thinking-about what's going on, actually direct your attention to your experience right now. For instance, close your eyes and listen to the sounds. Are you "here" where your body sensation are with the sound over "there" - or are you also beside the sound?

Further ones mentioned here [POST: Hell Zen.] and here [POST: You can't have anything you need.].

Basically, you want to spend some time realising directly that you are having a dream-like existence, with sensations floating in space and no central "you" doing the experiencing and doing. Also, do a daily releasing technique (basically, just lie on the floor and let go completely - of your thoughts, body and, most importantly, your "attention" - and let things unfold and unwind as they want). You'll find it really helps your work. Particularly, you'll probably find you stop wrestling with yourself so much, and it'll become a little clearer just is what's happening when you "do magick".

*Q: Basically, you want to spend some time realising directly that you are having a dream-like existence, with sensations floating in space and no central "you" I've done this all my life. I've always thought everything was connected when I was a kid. I thought if people tried hard enough, even without picking up body language, they could read people's thoughts directly. Or predict the outcome of one's actions. When I was in middle school, I thought this girl knew I liked her and I tried everything to get her to like me, but I became a victim of my own beliefs and told myself she didn't like me, when now it's pretty obvious she did. That was just one instance where I realized everything was connected, way before I read any hermetic or taoist texts or the tanakh/bible.
Later I knew that reality wasn't how we experience it when I learned about different waves of electro-magnetic energy, and also began to experiment with psychedelic drugs in highschool like pot, and learned about DMT and stuff, I realized that we're just a product of chemical reactions in our brain and it's up to our psyche to interpret them. It's funny ina way, our brain is an alchemical engine*

Cool. I had much of the same thinking. So true about the belief-overly thing that happens. And thinking about interconnectedness...

But, do you experience this directly?

Right now, do you feel like you are a person who has a body in a room typing at a keyboard - or - do you feel that you are a vast space of conscious awareness in which various thoughts, sensations and perceptions arise?

It's not even about the brain, EM waves, whatever - those are just thoughts (although it's a good way to think about interconnectedness). This is about direct knowing. Literally experiencing it as real, right now.

I get what you mean, I should meditate and try to directly experience interconnectedness, any tips on stuff I should do? I like your concept that we are just a conscious awareness in which sensations and perceptions arise.

Well, there's nothing special to it. Try the links I pointed to, or check out Rupert Spira's books, Presence Vol I & II for some good guidance. And checkout the experiments at Douglas Harding's website. There's no action to be taken, it's really a letting go. It's like you been 'holding onto' thoughts or your body with your attention - and so releasing your attention you find you open out and discover the context in which that was arising.

Even just: Lie on the floor, let go, and decide that you are the space in the room. Just give up completely and say, "I am the background space of this room". And see what happens.

Mantras, prayers, affirmations, are just very indirect ways of tweaking background beliefs. If you were feeling determined, you could just constantly assert that this is a dream-like world and you are the dreamer, as you go about your day. Inserting/asserting that fact alone will make a big difference.

(Everyone always wants to "do" something, but in truth any physical or mental act is largely irrelevant. It's the decision + any accumulated habits-beliefs-expectations-memory traces, that is key. Being quiet and asserting without fighting is enough.)

Lucid dreaming is also a great way to experiment (check out Robbert Waggoner's book if you haven't already, and also this [<http://www.dreamviews.com/dream-control/46571-infinite-universes-lucid-dreaming.html>] interesting thread).

POST: Thoughts on narcissism? Thoughts on vanity?

I'll have a go with this...

Narcissism

A state of constant, extreme "self"-defence. A person's attention is focused on a small area of their experiential field: typically the thoughts that occur towards the rear of the head area. As a result, they are not really "in the world" and the world seems like a threat. Correspondingly, the world of thought and the self-concept (ego) seem very real. There is a grasping on to this concept and a near complete identification with it which means daily life is a constant struggle for survival. Actions are undertaken in defence of this concept; to keep the story alive. Feeling good = thinking good about oneself.

External achievements and relationships are not valued, because they are not "felt". The narcissist is disconnected from the world and his own bodily 'felt sense' and emotions.

The narcissist is an idea.

Furthermore, he is unaware of the existence of the things he is unaware of. The narcissist has no "sense of touch", while being unaware there is even such a thing. He builds theories about "hard and soft" without having the experience. He rationalises and explains - about relationships, about the world - but never knows or that he can know.

Vanity

Similar to narcissism. Identification with an image or thought, a mental construct but perhaps connected with some sensory aspects.

In both cases, the solution is to release one's focus of attention and expand it, direct it out into the world - the background space of awareness. In this way, the narcissist re-contextualises himself, reconnects to the ground of existence. He acquires direct knowledge.

EDIT: Added quotes to emphasise that I mean defence of the conceptual "self", one's self-image or internal story, which has become misidentified as one's real self or true essence, to an extreme level.

Defending yourself is not narcissistic . Speaking out against the Conservative government, or the abolition of the Canadian senate.. etc.. is not narcissistic . The people who warn you about narcissism are the same person who attack you.

I think you misunderstand - or I wasn't clear. I should have said "self"-defence. In other words, defending your concept of yourself, your internal story or self-image. This is different to defending your property or livelihood.

I will make that change.

Q: This is different to defending your property or livelihood. Is it?

Within the context of OP's post, yes. But I know what you're getting at, Nefandi, and it would be exhausting.

Humility is overrated. Vanity has been given a bad rap. A peacock serves no greater good by hiding his feathers. Maybe we are here to be beautiful, prideful expressions of consciousness. My vanity has not been a hindrance to any of my relationships.

Thing is, a peacock is not enamoured with its own feathers; it is not vain.

But yeah, people should take care of themselves.

POST: Stupid question, but nagging me. If belief affects reality, do schizophrenics and narcissists have an advantage?

I don't think beliefs shape reality; but they do filter the "infinite gloop" of reality. More specifically: they filter the experience, but not the ability.

What does it mean to "do" something? It means: intending it and subsequently experiencing it. There is no actual "doing" involved at any point; there is only the "experience of doing". Given this, the narcissist and the schizophrenic don't have an advantage because they don't have the intention aspect under control.

The narcissist is vulnerable and self-deludes; he fantasises about status but does not intend results. He sees confirmation in existing situations through mild synchronicity but does not actively leverage them in a magickal way (I suggest).

The schizophrenic, meanwhile, is cracked wide open to an expanded experience. Again, he does not have intention under control. He is simply bombarded with extra information and massive alignments. His intensity means he is constantly willing and shifting his world. If he is lucky, he will learn to use some of it to his advantage. More likely, his lack of "formatting" will render him confused.

"Normal" people with magickal ambitions have enough trouble grasping the idea of will; these guys are further disadvantaged in that, just in opposite ways.

POST: Visualizing with your body as well as with your brain. The stretched third eye.

Well, isn't this just you noticing that all your experiences occur in the same "perceptual space"? I mean, the "head" you think you are thinking in now isn't your real head... it's just an area in your overall extended spatial experience in your mind.

The room around you is literally your mind, and you can "reach out" into it and visualise into it anywhere. If you "expand out" your attention into the space around you, you'll find you can be the whole room. Because this whole room is your imagination and anything you think in that space is your imagination.

I have a little metaphor I use to help remind me of this. (Note: in reality it's more like a "holographic conscious space" but the floor-pattern idea is quite, um, grounding and accessible.)

The Imagination Room

There is a vast room. The floor is transparent, and through it an infinitely bright light shines, completely filling the room with unchanging, unbounded white light.

Suddenly, patterns start to appear on the floor. These patterns filter the light. The patterns accumulate, layer upon layer intertwined, until instead of homogenous light filling the room, the light seems to be holographically redirected by the patterns into the shape of experiences, arranged in space, unfolding over time. Experiences which consist of sensations, perceptions and thoughts.

At the centre of the room there are bodily sensations, which you recognise as... you, your body. You decide to centre yourself in the upper part of that region, as if you were "looking out from" there, "being" that bodily experience.

At the moment you are simply experiencing, not doing anything. However you notice that every experience that arises slightly deepens the pattern corresponding to it, making it more stable, and more likely to appear again as the light is funnelled into that shape.

Now, you notice something else. If you create a thought, then the image will appear floating in the room - as an experience. Again, the corresponding pattern is deepened. Only this time, you are creating the experience and in effect creating a new habit in your world!

Even saying a word or a phrase triggers the corresponding associations, so it is not just the simple thought that leaves a deeper pattern, but the whole context of that thought, its history and relationships.

Now, as you walk around today, you will feel the ground beneath your feet - but you will know that under what appears to be the ground is actually the floor of the room, through which the light is shining, being shaped into the experience around you. And every thought or experience you have is shifting the pattern...

Q: Well, isn't this just you noticing that all your experiences occur in the same "perceptual space"? I mean, the "head" you think you are thinking in now isn't your real head... it's just an area in your overall extended spatial experience in your mind.
well of course it is, but i think what we need to realize is that our illusion is multi layered. Its not just being in an imaginary body or being an imaginary brain, its being an imaginary brain within and imaginary body, allocating all of it to one thing makes it much easier to work with.

Hmm, what I was getting at is that you don't experience a brain or a body at all, as such. You can just cut straight to noticing that what you really experience is body sensations, perceptions, thoughts and so on "floating in your consciousness space" - and all of those are literally thought/imagination/mind-stuff. You may occasionally think-about being-a-body or being-a-brain, but you never actually experience that.

(We're probably talking about exactly the same thing here, right?)

You're coming from a pure subjective idealism position.

Not really (although we do end up there). The only insight that's needed comes directly from the everyday notion of "an external world affecting the senses which the brain turns into a representation". This immediately means that the scene around you - if not its origins - is "in your mind" and you can direct your attention anyway.

In other words, the "standard model" alone leads to this. It's the error of thinking of ourselves in the 3rd-person (a body, with a brain in the head, which is us) which has led us to mistakenly configure ourselves to locate our "felt-location" in the head area. (A moment's pondering shows us that it's ridiculous though. Look inside someone else, and you don't find "their" location in the same way as you feel yourself to be located - etc.)

The next steps are what takes us to "advanced" level: realising that you can direct your attention outside your body boundary (since the sensory experience is all within mind) and then on to ponder whether there is such a thing as an "external world" (if we cannot ever experience it, is it not also just an idea in the mind), and then we get to at least idealism of a sort. All the other good stuff we've been playing with.

Under a physicalist model...

Everyday people don't have such a physicalist model, though. They have a half-hearted version of "I am a brain in a body". With a sort of naive realism hanging off that. Following through on that with "the experience I am having now is inside my brain" follows naturally from this, after a pause. From there it become reasonable that one can extend one's attention throughout the body-space - enough to allow yourself experience it. Most people haven't really thought about this at all (including fellow occultists and even lucid dreamers). They've just ended up with an assumption and don't pay to much attention to it.

I'm not jumping here to my own position - I'm simply pointing out that you can justify expanding your attention out, based on the everyday basic model of "experience is in the brain".

The problem is, if you start taking physicalism seriously enough to follow this implication, you'll also be taking its determinism seriously as well. Do you see my point?

I do, but you are thinking far more deeply that anyone normally does. Purely dealing with OP here, and having led people through this in conversation, you find you don't have to. They don't have deep convictions or a worldview - they have sketchy unexamined assumptions. Again, most people really don't have any idea about determinism and brain-states and so on. They really do just have the fluffy vague idea of "I am my brain, in my head" while promptly behaving as if they were directly seeing the world. The brain and head they are referring to are metaphorical. (Which of course they are, but not in the way they think. Although actually in the way they think. And so on.)

The simple addition of "this all must be in your brain/mind" is sufficient to allow people to get more benefit from including their body-space (for daily use and ease, for healing, and more besides). They are not really changing their "philosophical system", because they never had a philosophical system in the first place.

Of course, having made this small step which leads to experiential change, they are in a better place to explore such things if they so please.

Actually, I'll point out that my first reply I did on mobile and, a) It hadn't displayed the first part of OP and I didn't realise, b) I hadn't twigged it was cosmic, because that appears at the top too. Which is why I added a little response later.

I think of it as most people have a "bag of metaphors" rather than a philosophical system, which is why it tends to be incoherent, being unexamined - e.g. that the "we are our brains, run by chemicals" but that obviously we make choices and have free will, etc. People may ever assert that they are "machines or computers" but one second later they will state a belief contrary to that.

This is a good thing - that lack of coherence - because it means the errors can be easily overturned.

The reason I don't like calling it a "philosophical system" is because that implies some sort of coherence. And it doesn't match with people's actual experience of their thinking in this case.

They think past causes the present.

Always a trick. Since I'm lazy, I'm not going to cut-and-paste a metaphor I was discussing elsewhere, trying to show that there is just an ongoing (and effectively "dumb") pattern which evolves, including the part of the pattern which we might call "the past".

On Time and Metaphor

His [Alan Watts'] metaphor of "the ship and its wake" is excellent for capturing your true situation. From his book What is Zen?...

We think that the world is limited and explained by its past. We tend to think that what happened in the past determines what is going to happen next, and we do not see that it is exactly the other way around! What is always the source of the world is the present; the past doesn't explain a thing. The past trails behind the present like the wake of a ship, and eventually disappears.

Now you would say that obviously when you see a ship crossing the ocean with the wake trailing behind it that the ship is the cause of the wake. But if you get into the state of mind that believes in causality as we do, you see that the wake is the cause of the ship! And that is surely making the tail wag the dog!

The point is this: You will never find the mystery of the creation of the world in the past. It never was created in the past. Because truly there is nothing else — and never was anything else — except the present! There never will be anything else except the present.

-- What is Zen?, Alan Watts

Now, this essentially means there isn't even really a "present" - rather, there is an "ongoing unfolding". A pattern which is evolving its shape, a bit like those video-feedback patterns you get when you point a camera at a screen showing its own image. If it's an old CRT screen with a bit of a smearing, then that captures the whole situation: the main pattern is slightly smeared as it goes with a slight after-image. This smearing, that after-image which forms part of the main image, is something we called the "past" or the "context".

Thing is, if that video image just suddenly changed dramatically and discontinuously - say, from circle-based imagery to square-based - then after a moment of tangled confusion all trace of the old circle-based imagery would be gone. All there would be, would be the square-based imagery and the square-based "smear".

In other words, our "world" always seems to be consistent as if there is a past causing it, one that is of the same structure as "the world". But in fact, the metaphor shows us that the present is either uncaused, or caused by something quite different to any image, or caused "by itself" - the "past" is simply a part of the present image, just of a different intensity to the rest of the image.

Any causal frameworks we read into the patterns are simply accidental regularities, in among the semi-randomness of feedback, which we have become fixated upon; after-images which keep being re-triggered so as never to fade completely. The patterns themselves have no such causal structure, it exists only in our interpretation...

EDIT: Did some minor editing on the last paragraph to mention the re-triggering for observed regularities. Obviously the "camera" and the "screen" and the "image" are all one, once you take this a step further, and the complexities lead to repeating stabilities, but the essence is there.

So what this means to me is, most beings are pragmatic, and will only start paying attention to something, examining it in detail, and learning to talk about it, if it somehow improves their day to day well-being.

This is a very good point. The clash between one's internal models and external situations needs to be quite severe before people are brought to reconsider things. Mostly they just avoid such situations (because they don't know how they could understand and adapt themselves).

This isn't due to a lack of intelligence, it's to do with the narrow education and information that is generally available. There is no "meta" level to the learning that people are put through.

For people who are liking physicalism and are getting good use out of it, they don't need to do anything more than go to work and have fun in the off time. Nothing in life will challenge their physicalism, so there is no practical demand to look very deeply into its implications.

Which leads to interesting conclusions: That those who are driven to investigate, dismantle, rediscover, are they always those who are disadvantaged in some way? Whether that is economically or psychologically, in some way jarring or at odds with the setup they were born into. In short, more "sensitive"?

If I didn't use words like "always" now and again, we'd struggle to find disagreements! :-)

I agree, but this might be intentional. [Lack of "meta" level to education.]

I do think this is intentional - or at least, unintentionally intentional. The education system is not really designed for free and frank inquiry, exploration into the nature of the world and oneself. It's far more a "shaping of people" to fit the predefined requirements of the economy (or aspects of the economy). Education is mostly training. And largely behavioural training at that; behavioural structuring, particularly around artificial notions of time and of "hierarchy" in the general sense.

It's actually quite disadvantageous to have many intelligent people, from a certain point of view. In fact, probably very few people who are in positions of influence are especially intelligence; it's more a matter of emotional management and "flexibility in the face of moral ambiguity".

POST: Spirit Possession on LSD.

I wouldn't take the content of your experience too literally. In my view, things like LSD simply loosen up your constraints and your experience becomes less logically structured, more associative. They are real as experiences, but they are not real in terms of there being some fundamental truth to them beyond that. All experiences are relative. This is true of everyday life as well as "unusual" experiences; they are all of the same type. They all arise in the mind, and reveal the patterning of the mind, rather than the patterning of some fictional "external" world beyond it.

For instance: The Patterning of Experience and related links.

Have you ever had a lucid dream? They can be more real than real. Sometimes they can last what seems like months, even years. Imagine if you had a lucid dream one night, but had never heard of lucid dreams. What would you make of it? ("I love lamp." [Repost: A Parallel Life / Awoken By A Lamp])

POST: What does r/occult think of r/dimensionaljumping

People here can greatly influence what goes on there. I feel like it is a very useful idea that needs to be taught by you folks.

The problem is, we can easily end up with just one big "magickal soup" with people exchanging the same received wisdom, all "educating" one another about how this-thing is "really" that-thing, and so on.

Although the origin of /r/dimensionaljumping was people playing around with mirror rituals, over time it's become something else: a place to explore the "nature of experiencing" for people who either don't have a background in that sort of thing, or want to approach it from a relatively clean slate in terms of language and metaphysics.

I think all of us tend to get distracted by the models and concepts from the past, perhaps reify them as being special, even though with their context unavailable their meaning is often now not clear - or perhaps seems incorrectly obvious. They get taken pseudo-literally. People spend time looking for "the secrets" when there really are none; you just have to experiment. So we just put that aside. At most, there's a highly abstract base model of "patterned meaning" of an apparently subjective perspective.

So for sure, the various exercises contributors come up with do allow people to recognise that "something is going on" and get some results, but the larger purpose is to question things more deeply without becoming attached to any one narrative. And that includes the idea of "dimensional jumping" itself, which isn't meant to be "how it works" - it's simply an example of an equivalent "pattern" one can adopt, a seed for thinking this stuff out. Eventually, one realises there is no "how it works", of course, and your concept of "you" gets updated accordingly. But just reading that doesn't really help anyone get it or apply it.

Anyway, all this is why the meat of things tends to happen in the discussions rather than in the posts. The mods keep their hands off, because it's all about the experimentation. Then every now and again someone shows up to say sarcastically, "nice one so you've discovered 'sigils' eh?" - to which the answer would be: so what is a sigil and how, exactly, does it work? And so on.

That's the rationale, anyway

POST: delivered from the lust of result

Maybe that's what the mind is, our infinite void where anything can be created.

Well, you've nailed that I think.

Our mind is the void in which everything appears, and is immediate creativity itself - if we detach and allow our accumulated patterns to settle and shift. If we are holding on to "parts of the dream", though, then our creativity is compromised by or funnelled through those parts.

Do you have a link to that Peter Carroll audio clip? Not heard of it before. Makes sense to me (we have a tendency to fill our creative 'First Cause' void with surrogates which we give our power to).

Not sure the name of it. You should find it in YouTube searching Peter Carroll chaos magic. The audio clip is also in the first episode of scrolls of thoth. "Just as daylight obscures the stars, so does wkefulneswakefulness obscure the fact that we are still dreaming"

Thanks, will do that.

The stuff about creating a mental landscape is my favorite.

Sounds like my kind of thing - great.

I read Liber Null a long time ago, but have not much recollection. The only thing I have my doubts about: he was very much of the "magick is bending probabilities" view, was he not? I think that was a restriction he, in effect, imposed upon himself?

I think he was just living in the real world. You can visualize flying, it doesn't mean you flew. Until someone proves they can do seemingly impossible things with magic, I'll have to submit that it is the world that imposes these restrictions, not Carroll.

For sure, I don't mean we can just do anything on a whim. I was more thinking that the idea of it being probabilities might be restrictive. I've been thinking more in terms of plausibilities - something that might actually be more flexible (and helps us get rid of worries about retro-causality, etc).

Of course, that's just more words really.

Doesn't that mean the same thing? Probability is a specific measurement of plausibility I believe.

The distinction for me would be:

- Probability implies that experience is bound by a separate external world with rules which are independent of us. What we experience is dictated by the "world's formatting".
- Plausibility implies that experience is bound by the stories about a hypothesised external world - what stories we find acceptable. The rules are part of us. What we experience is dictated by our "human formatting".

As an idea, I think the second version makes it easier to envisage how magick works as part of our minds. For instance, if you're playing with synchronicity, not only will you "notice" more of the object or pattern you have in mind, you will also encounter events which "come to you". Those events will seem to have their seeds in events that predate your intention.

Probabilities don't easily account for that. Plausibilities do so more easily (anything can happen so long as you've not yet observed something that means it shouldn't happen).

Sorry - that's probably (aha!) not very clear.

EDIT: This blog post [<https://web.archive.org/web/20090915212504/https://pomomagic.wordpress.com/2009/08/01/why-cant-you-teleport/>] was quite a nice - and honest - comment by someone wondering what the limits are.

I would see it as an accurate and a helpful thing to say that it's easier to change something with probability on your side.

Hmm, my feeling is that it doesn't say anything, other than "we can't do miracles", and doesn't help, because it doesn't suggest a particular approach. It's maybe more honest to call this plausibility than probability - since the probability (being a mathematical notion) implies a measurement and an adjustment, but it isn't actually measurable and the adjustment detectible. What we really mean is "seems unlikely"?

But we're just talking about a language preference here. Really, I was just wondering aloud whether choosing the concept of probability vs another might influence one's magick!

You are trying to apply what he said to synchronicity which has absolutely nothing to do with causing change.

Intentional synchronicity is exactly how we cause change (or one way). But I didn't preamble this, so fair enough! To be clearer what I mean by that: Focusing upon a particular conceptual pattern, results in that pattern subsequently appearing in external and internal experience. Something I've been playing with.

Just to begin: remember, I'm not disagreeing with you here, we're just exploring how best to discuss.

It's not saying only focus on mathematically accurate probabilities. You seem to have a very strict view of the word.

Peter Carroll was approaching it exactly that way in Liber Null, via his formulae, so that's the way I was interpreting it:

M = G x L(1-A)(1-R)
Pm = P - P x M 1/(1/-p)
All factors are between 0 and 1.

M equals the force of your magic. Which is dependent upon your G (Gnosis) and L (magical Link) multiplied by two negative factors. (Things working against you). Your conscious awareness of the desired result (1-A) and your subconscious resistance to doing magic (1-R) -i.e. "Mommy told me magick doesn't work."
In the other formula, P equals the chance the event you desire occurs by itself; (1/(1/-p)) equals the chance that the result you desire will not occur. Pm equals the combination of the Probability that the event will occur combined with your magical effort to make it occur.
[Most of these are unmeasurable, and it particularly seems difficult to measure the probability of an event - TG]

Surely by probability here we just mean "what we think will happen"? There's no way to measure it other than our own opinion. Which is basically "plausibility".

Yes focusing on things makes you notice them in life. That has absolutely nothing to do with using probability. That's where you seem to be tangled up.

It's a little more than noticing. Focusing on things "being a certain way" and then find them to be that certain way afterwards, is what magick is all about. Chaos Magick particularly, right?

Do you disagree with the notion that it's easier to go with the current?

But, for sure, the closer your desire corresponds to everyday experience, the less change you will have to create - because your everyday experience is by definition the default. Apparent "habits" of the world. But this issue is with ourselves, not with the world.

Anyway I definitely agree: We should use pre-established habits where possible, just because it's more efficient. Where I disagree is that what magick is, is "bending probabilities".

EDIT: An extra observation I'd make: absolutely everything works, if properly committed to. It doesn't matter what imaginary notions you adopt for the purpose, they will work to the extent you invest yourself in them, even temporarily.

Seeing a thing a certain way and it being that way has nothing to do with the probability thing. at least that's how I saw it.

The way I was viewing it was: Seeing things as governed by probability, means you are indirectly willing it to behave that way - as a general worldview? Adopting that outlook is a piece of magick all of its own. If you view magick as being about probabilities, then your magick will go along those lines. If you view it as being about energy, the same. And so on.

He's establishing realistic expectations rather than woo and fluff, however inspiring it may seem at the time.

Perfectly reasonable. I say: everyone must experiment for themselves to find out what is possible. One caution though: Your expectations in magick (about what is possible, about how it works) plays a large role in defining what you can do. It's not like science, where there's a "how it works" and you discover the rules and leverage them. There is nothing "behind" magick.

But that's not to say you'll be flying around the place by flapping your arms any time soon. It might well be possible, but you'll probably have to do an awful lot of work to establish that "habit".

There's an old story about a student coming to a master and saying "Finally, after 40 years of study I can walk across the river unaided!". To which the master says, "What a waste of a life, you could have saved a lot of time by paying a penny for the ferry like everyone else!"

Who knows what we could do if we dedicated ourselves to it? But: who really wants to do that?

I think he's just saying don't expect magic lottery winnings and that using magic to influence business may be a better idea more prone to success.

I think he is of that view. I personally think that magick can be far more direct than he suggests. It (that view) is just another metaphor, after all. But that sounds like I'm dissing his take - not at all. It's been very successful for lots of people, and the fact that people can easily get behind it - it makes sort of rational sense to them - is part of its power at a metaphor.

Hmm. See, I'm not disparaging Peter Carroll. I'm just wondering about how adopting a way of looking at things changes how we operate.

The laws of physics do not simply exist because we believe in it. Try to understand that our laws of physics were discovered, not enforced.

Ah, I'm not saying that believing things causes them. I'm saying that the "laws" of experience should be viewed as habits - ingrained patterns that have become established over time. So they are not how it really, really works in some deeper, given sense. Gravity, for instance, is a very ingrained habit of the universe.

(The word "law" in physics does not mean something that is laid down; it means something like "observed regularity".)

Where belief comes in, is that it dictates what directions we will apply our effort with full commitment. Carroll phrases it as "your subconscious resistance to doing magic". It's more that non-belief - or adopting a worldview which says something can't happen - has a negative effect.

You can't say anything is possible but you won't fly by flapping your arms.

Let's be clearer: Anything is possible in principle but it is up to people to find out what they can accomplish in practice. Certainly, my experience of flapping my arms into flight is quite... limited. Again, I am not claiming that believing makes things happen. I'm with Carroll in saying that non-belief gets in the way.

You don't think probability affects it? So your magic always works directly?

Magick always operates directly, yes. Let me lay it out, how I think it works:

- Over time, patterns become more and more established in the universe. You might call these "habits". This includes things like gravity, the structure of your body - the way things work by default.
- Magick is just everyday intention really. Intending something *is the magick*. Whenever we intend something, that intention always comes about in some form, funnelled through the current patterns. e.g. We intend to move go to the door, our bodies walk there; typically we don't teleport.
- In other words, the "habits" of the world imply the most likely routes that intention will manifest along, and restrict the types of manifestation. For instance, you will often see other aspects of your intention appear in images in daily life, dreams, conversations, symbolic representations, and then as an event. The restrictions aren't because things aren't possible, they are because deeper habits or channels exist.
- The difference between what we call "magick" and everyday intention is that in magick we realise the situation (that all intentions manifest, that laws are not actually fixed rules), and therefore intend things that are against common sense. The more directly we will this, the more focused the result.

In summary, what you are calling "probability" is just a way of saying something is unlikely. It isn't forbidden or impossible. But that's hardly helpful.

Either the world is your personal dream or it isn't.

I never understood the idea that just because the world is a dream, you should be able to just "flap your arms and fly". After all, can you just think of, say, a tree in absolute detail right now? Most people can't - but your imagination really is your personal dream. You can get better at it though. Meanwhile, in lucid dreams, people find they sometimes can't fly. Why not?

My answer: because as described above, manifestation is about implied patterns, not about direct creation.

This is just "a dream". But it is "a dream that". A dream that you are in this world, organised this way - in the same way as we can lucid dream a persistent realm. Different dreams have different levels of organisation, of habit. They all obey the basic rule (intention always manifests in some way) though.

What if, in a dream, you intended that there was gravity and that gravity was always unbreakable? If afterwards you couldn't fly, would you complain that it wasn't actually a dream after all?

Physics in dreams is never that consistent.

If you experiment with creating persistent realms (as described by Hyu in his post), then it is. When you just fall asleep and end up in a dream, then it tends to be somewhat breakable because you didn't intend any rules. You can experiment with this: In a lucid dream, create a door and go through it with the intention that you will enter a stable realm and you will. You'll discover its physics is not breakable just by "wanting" to fly, for instance, even though "hey! this is my dream!"

And that's because you created the dream with rules. You would first have to change the dreamworld to make it possible to fly, and then fly. Which you'll find is incredibly difficult.

I didn't impose gravity on myself, it was imposed on me.

Perhaps you created a persistent, rule-based realm - and then forgot you did it. If you want to fly just by flapping your arms, you are going to have to first make it possible to fly doing this. Then flap your arms.

I'm not saying it's easy to break such a fundamental rule. However, there are other things that are perhaps even more disturbing that are possible. Influencing the weather, for instance, seems to me more rule-breaking than flying - because in that case, you are affecting something that is not part of your body.

No probability doesn't just say things are unlikely.

Really? If it can't be quantified then it's really just "stuff you think might happen anyway, but is unlikely". But let's skip that - you're saying that (according to Carroll) it's easier to use magick to produce an effect which you already consider to be within the realms of possibility.

Certainly that's true.

In other words, we're dealing with something which might happen anyway, it's just that we are helping it out by giving it a push. For sure. That's certainly a valid approach, but I'd hate to think people were limiting themselves to what they thought "might happen anyway" when experimenting for investigative purposes.

If he was wrong, I think every magician would have won the lottery.

The "lottery winner" thing is interesting. Personally, I don't think I'd want to win the lottery. If you want to be wealthy, there are better ways. I would wonder whether anyone who could, would...?

For fun: if you wanted to win the lottery, using magick, how would you go about it?

Yes, perhaps all the rules were created and forgotten by me. Nothing in reality suggests it and you can in no way prove that these rules are breakable.

Well, the difficult part is actually to prove there are rules. We can only say: "my experience is consistent with the notion that there are rules". Unfalsifiability and all that.

But we're just exploring ideas here. What is the evidence that our common experience is how things have to be, and that they are a result of fixed rules? No evidence, other than the experience itself. If you manage to create a contrary experience, even once, then that idea of a rule-based reality - rather than a habit-based one - breaks down.

I say rules are effectively just strong habits.

You seem to take "I can do this" as proof that anything is possible.

For the purposes of discussion, here, we're talking about hypotheticals as much as anything else, right? You seem to be saying that whatever you haven't done is proof that it's im-possible. :-)

So - you bring up a good point about the rules of physics. Flapping my arms and flying would be a no-no, but pointing at the sky and the clouds disappearing would be okay - because we could say the second case was coincidence. It's borderline plausible but it is still plausible, right?

How far can we push it and still have it be okay, do you think? Is not directly experiencing it happening one ingredient which may help things? For instance, people driving somewhere and finding afterwards they've covered a 1hr journey in 30 minutes, that sort of thing.

He used the term "higher probability" which in no way implies or suggests anything more than a vague sense.

I think we got caught up here. I just suggested that "plausibility" was a better word for general use - mainly because while in cases such as the lottery we might be able to have a literal probability, but in most cases we just mean "seems more likely". Nothing more than that!

I am talking about the real lottery, not scratch of tickets.

Yeah, I had in mind the national lottery (or state lottery, or whatever, depending on your country). I've never really given this much thought, but I guess I'd do my usual thing of asserting it as fact which is a sort of effortless willing. However, this requires a genuine desire and a bit of committed confidence. (This is where my thinking comes from that you probably can't easily do this: most don't really want it, those that do won't be able to commit due to doubt or conflict.)

What other, more "plausible-probable" things would fall into the same general category?

Yes, those rules have been proven. Scientists didn't just write down "da laws of fisics" and that was that, these "rrules" are what we have after a long time of research.

I think you're getting hung up on something that we can't be disagreeing about.

People have over time seen "observed regularities" in nature. From there they have created descriptions (models) which help us talk about the world in terms of those regularities. The most basic of those we call "laws". The law is the repeated observation. A law is "a scientific generalization based on empirical observations of physical behavior". By definition, only the most common, recurring patterns are described by physics, and from there only the simplest descriptions can become "laws". These laws are an account of what we have seen, not a statement about how things work.

Which doesn't necessarily mean you'll be flapping and flying any time soon. But it also doesn't mean that the world is a rule-based mechanical place as a whole.

Forget coincidence, explain how cloudbursting breaks any law of physics.

Are you suggesting that cloudbursting by intention (rather than dumping chemicals on clouds from planes) can be described by the laws of physics?

I'm saying that not being able to just fly... is a pretty good indication that we are not living in a fantasy world where are beliefs become real.

Only you are saying that "beliefs become real". I am just suggesting that a lack of belief tends to make it unlikely you'll engage in any prolonged experimentation in that direction. And I still don't get why you would expect to be able to "just fly", any more than you'd expect to "just speak Hungarian".

It reminds me of people who oppose philosophical idealism because if everything is made from consciousness, why can't they just think objects into materialisation immediately! Which is as bad as saying, if I'm made of atoms why don't I have power over all the atoms in the world, since we're the same...

Considering that time is not a unit of measurement for distance, I would say you made up those numbers to convince yourself that you did magic.

Hmm. Surely you get the point I was making there? That making a journey in impossible time. If you've played around with this, you must have had such an experience?

But we don't have exact odds for the lottery. No equation accounts for the chance that a winning ticket gets destroyed.

Depends on the lottery. In the UK, you can work out the exact odds for a set of numbers corresponding to the randomly drawn numbers (see here [<https://lottery.merseyworld.com/Info/Chances.html>]). Not sure if the process is different elsewhere?

Again, I am not saying that believing in something makes it happen, or that not-believing makes something not-happen. What I am saying instead is:

We shouldn't assume that our everyday experience is the whole thing, and we shouldn't believe what other people say is impossible or possible - although it might provide inspiration. It's up to us to try things out.

I'm kind of relearning that life is a giant lie and how gleefull people are in selling that lie for free.

What kind of lie?

So we can only conclude that the universe seems to follow patterns when we have all these patterns down completely on paper?

It doesn't follow patterns. It is patterned. I'm saying it's not "rule-based and mechanical" but I'm not saying that it isn't patterned. In fact, I don't think humans can perceive anything that isn't patterned. In fact, my summary would be: "no pattern should be interpreted as being fixed and no description should be viewed as capturing a whole pattern".

This isn't controversial. This is exactly science's approach, right?

[On cloudbursting...] I said I don't see how it breaks the laws of physics. I never said that it could be used to explain it.

I agree. But many would say that it does break the laws of physics, in that it can't be accounted for and is therefore impossible. I don't believe lack of an explanation means something is impossible. And neither do you, it seems.

My point was that cloudbursting doesn't prove that anything is possible with your mind.

That can never be proved. If there's something you want to achieve, then you must experiment and see if it can't be done. If you can't, it's proof that... you didn't succeed. And maybe you never will, of course.

No, if the world is just our imagination, asking why we can't imagine something else is a valid fucking question.

It's not "just" our imagination. It's a particular imagining, right? We have imagined that we live on a planet with gravity and water and all sort of other cool stuff. I don't see why you expect to be able to wish stuff different without any effort.

Nobody ever ever has all the variables, yet we still call it probability. That's all my point was, really. We never have all variables, even if they use really big numbers.

Right. That's true. So a theoretical probability then, based only on what we have included in our description or model. A bit like only including previous observations into a theory, and assuming that this is sufficient.

I get it now. People with enough money to not have real problems, so they play pretend, with everyone else's lives.

Well, there's something to that, certainly.

Hey, sorry, we totally got bogged down in that whole probability thing. My fault. I apologise.

Stop saying we can just change reality and only offering excuses as to why it never fucking works.

Y'know what? I've no idea how it works, not exactly anyway. That's the problem. Which means I also can't tell why things don't work. Things do change in unlikely ways. I don't think it's to do with belief or effort. When things happen, it's not about trying.

It definitely involves detachment and it definitely involves "will" via (optionally) imagination. And it always produces some sort of result, although sometimes it's just symbolic (like, encountering stuff about your desire but getting your actual desire).

Things do sorta work how you think they do. But I don't mean how you choose to think about them. I mean, how you think they do when you ask yourself how you think something works. (Sorry, that's not very well worded.) I guess that sounds like "belief" but that word is so misused now.

Really it's better to say that it's to do with your own patterning. That changing your own patterning (or "formatting") is the way to produce change, and the way to change your patterning is via will and imagination.

The occultist joins an order to learn magic and improve his life, they teach him to clear his mind so they can fill it.

I don't believe in any of that order stuff much. I think most organised occultism is pretty uninteresting or was about management. Meanwhile, people keep trying to look for explanations and reasons, and they get further away from understanding. Every new theory or technique is a step away from achieving anything.

I linked this earlier, but this blog entry on Why Can't We Teleport? is one of the most honest I've encountered (his book is pretty good actually). The problem isn't necessarily that we can't do things, it's that we don't know how to test whether we can do them or not?

It's not belief, it's not effort. I'd say it's "willed imagination without obstruction" but that's hardly a very useable description. Within that, the actual details don't seem to matter much. Which means testing possibility is an issue.

I think I am starting to see what you mean. Making assumptions of reality kind of limits what we choose to experiment with and how. Believing that we are made of complete solid matter would of course throw off any research into teleportation, just as whatever mistakes we have now likely prevent us from trying the right things or asking the right questions about certain phenomenon.

Right, you've said it much more clearly than I did, but that's what I was trying to get at.

Which might mean that the deepest, most subtle traps we find ourselves in are transparent to us - they might be things we don't even realise we are assuming!

But that's some stuff so deep that you have an actual danger of falling in and being trapped in the question. Our sanity depends on our ability to trust our eyes and ears, two senses we consciously know are just collecting data that our brain turns into an artificial image. Question all assumptions and you may end up not knowing what's real, or if anything is real, or if everything is real. Those thoughts are not the scary part, the scary part is how the mind sometimes copes with this deep uncertainty.

I agree: I think the basics should be largely left alone for everyday life. You don't want to destroy its fundamental continuity!

Extreme version: Some autistic children have a hard time trusting that the lessons they learned remain true without continually re-testing them - e.g. that the floor still supports their weight; that an object that goes out of sight will still be there later.

So I guess it's more assumptions about personal achievement on a more macro-scale. We don't want to be reformatting ourselves at too low a level. We don't want to have to manually handle all the details, after all.

So maybe those that must live in that world are the ones who have ready access to that creative space, but lack the raw "knowledge" needed to refine or carry it out completely on their own. I guess I've never thought of autism in that way, interesting.

I think autism has much to teach us.

One of my ideas: that their attention is narrowed on the current sensory experience, and they have no felt-sense for the underlying facts of the world. The world has no baseline solidity for them; it's transient imagery and memory, without knowing. The "facts" don't stick or they are not aware of the place where the "facts" are stored! (Which I think is literally in the central "gut feeling" we have.)

In other words, they are an extreme. Unbalanced by one point of view, and that's technically true, but also superhuman in the sense that one or many aspects of themselves are cranked up to 10 while most of us are at 5. In other words, the blind man is the top dog when the power goes out underground. Maybe our society just sucks at understanding people and making certain roles available to people that are "not balanced" for normal life.

Right, nicely said. I think in other societies the autistic child and the schizophrenic and the epileptic (not equating those, just examples) would be considered as having a "connection" to a larger field of experience. Their relative lack of daily-life-handling would be allowed for, and their talents maximised.

The uniformity of western societies doesn't really allow for individuality of talent or perception. Roles are prearranged slots; society tries to mould its children into them but by assuming them to be identical and "formable".

Which, obviously, is quite a horrific approach. Not everyone takes to the "training".

POST: Chaos Magic and Forgetting

You don't need to forget, you just need to stop triggering the pattern of wanting/desiring. Nobody ever desired something they already had!

One view:

- Launching a sigil creates a pattern in time which leads to a future experience that is the one you desire. It becomes true now that this will happen then.
- Thinking that this is going to happen is okay, since it leaves the pattern intact or even strengthens it, streamlines it. Looking forward to something is not a problem.
- Thinking about maybes or other stuff or desiring overwrites the pattern with something diffuse to contrary.

In other words: know that it is done and then you can think whatever you want. Forgetting not required. Think of a "time landscape" that is always there, and is being updated every time you sigilise or think about the future with intention or expectation, direct or implied.

POST: Sigil and Law of Attraction Contradiction?

Okay, but... doesn't this whole thing depend on your world-view also? Even if the sigil is apparently shown only to "you", it's effectively shown to "the universe". The whole thing moves towards your goal, including your body.

The main thing about releasing is to let yourself be moved rather than staying in the "problem state".

The shooting metaphor doesn't work for magick, surely?

This is not so consensus bound; personal facts take priority. Sigils and LOA do not operate at that consensus level; they are effectively excuses for allowing things to happen "as if". The more you experiment, the clearer this gets. What you "imagine that" things are like is what counts.

However you think that it works,
That's how it works.

If you "imagine that" the world works according to the number of views an intention gets, that's what'll happen. If you "imagine that" forgetting your sigil is important, then even a brief recall or a glance might stop things right there - while those who don't care or haven't thought about it so deeply, won't have a problem.

An extra issue is that all the associations with a viewpoint also come into effect. If you "summon Hercules" to do your bidding, his great strength comes to your aid. However, Hercules had his issues in myth, and those will start to manifest too, even though you didn't explicitly consider them. This where it gets tricky and goes beyond what you thought you asked for.

I reckon it is impossible to fully specify or constrain things unless you create your own, clean metaphor/mechanism. (Or meta-metaphor.)

Really describing any action is describing Magick

I agree with this. The shift from one experience to another in alignment with "the format of one's mind", including intention, is a description that can be applied to everything.

While from your POV you may seem independent in everything you do the reality is that we all move with each-others blessing

I don't agree with the "simple sharing" model of reality though. As a "conscious perspective", all possible experiences are available enfolded within me. Similarly for you. However, this is not a straightforward dream. Sometimes we might think of reality as a shared dream with other people in a room, each of whom have contributed to the final, consensus decor. However, I reckon it's more accurate to say that those who have chosen the same decor, end up in the same room.

Finally, it's even more accurate to say: Whatever decor you choose, you will end up experiencing a room with that decor, plus versions/aspects of others who would choose that decor, as a version of yourself who would choose that decor.

the metaphor of shooting me in the face does work for magick

The above means that I can shoot you in the face (politely, of course) and have you die, while you dodge the bullet and live. Subsequently: Different rooms, different decor.

Fundamentally, this is because you are not a person, and neither is anyone else. The "being-a-person" sensation is just part of the present moment world-experience. You are in fact a perspective, attached to a viewport amongst infinite viewports, selected by the "filter" of belief, expectation, knowledge and intention.

TL;DR: Blessing not required.

..Yeah, I'm going to skip the gunplay for now. :-)
I've grown quite fond of you.

I say we don't need blessing because it's (implicitly) multidimensional enough in that everyone gets to have their experience. Not in the sense of actual spatially-extended universes though; only in the sense of filtered possible moments. But then, that's basically the ultimate blessing.

(The room is tesseract-shaped, and we are distributed clouds throughout it? Nah, too messy sounding.)

True connections with people occur when their filters correspond, as it were - they are literally "in the moment", together.

...I agree with what you say. The "filtering" I refer to is for what appears in the senses (image, sound, texture), via personal shaping and via accumulated patterns (the world), beneath or within this there is just the undivided one. So in that sense we are closer than objects can be, always.

At the fundamental level, everything is within us, and one step more and there's no "us" because even the perspective dissolves.

But if we are attending to the level of the senses, divided into time, then that connection is obscured except when the moment is shared, "when worlds collide".

...Hmm. I don't have a conception of God as external, but the DNA idea could maybe be translated into the idea of a "format" that implies which events will be experienced - via the personal God of imagination...

Loosely, I think of myself as a boundless aware space. (Everyone is this, simultaneously.) Within that, is dissolved all possible moments and experiences already created. My ongoing 1st-person sensory experience is simply my attention shifting across this eternal structure, in accordance with my intention and beliefs. Foolishly, I confuse "myself" with the content of the experience, when in fact I am the background in which it arises.

Gives us:

- Magick is changing the trajectory discontinuously in unlikely ways, by tuning into other moments via imagination. We are always doing this, but deliberate magick makes it more obvious because we are deliberately aware.
- God is the whole, the open attention in contrast to our usual narrowed, time-focused attention. God is not a being.

- When we say that God intervenes, we really just mean when outlier actions or events are selected which we didn't have a sensory experience of choosing prior to their appearing. The "feeling" that goes with this is the opening out of attention, to the background unity.

So all events are "archived" in the sense that they are all, permanently available for experiencing? Creation is already complete, you are just choosing which parts to check out!

Not sure how to join together the two ideas of God.

- By saying 'a god' I am just talking about an entity that has a greater range of data intake and influence

Right - I see that as just ourselves, the outer reaches of our attentional focus. We are always everywhere, we are just concentrating on somewhere in particular.

- Mostly I'm asking when this construct is animated; if in our life-time do you expect this will change your spirituality? Will you increase your own intelligence or try to keep a level of "purity"

I think this 'construct' is already animated. The construct is just the universe as it is. It's a case of doing or being this knowingly. 'Purity' would then be a choice to remain human-focused, ignorant of the larger information field (or whatever). I'm all for expansion - but as I said before, different people can do different things, and not necessarily interfere with the other.

...

I see, forget the sybmol, let it go. Is it worthwhile continuing with the desire, **the FACT that it will happen?**

...the FACT that it will happen?

This is exactly it. Ignore the evidence, know the fact. Everything else is theatre. All that matters is that you fully accept the fact that something is going to happen. All these methods are about sneakily inserting or adjusting facts-of-the-world. It all works this way, I think:

If you move your arm right now, you don't do it directly. You request/insert the experience into your timeline (you might say), the fact that "it is now true that my arm will move". The proximity in terms of space and time makes you think that you did it by more straightforward means.

In fact (heh), you simply don't have direct access to sensory experience at all; you adjust facts, and subsequent sensory experience arises spontaneously and consistently with those facts.

So it's about creating new facts-of-the-world by any means you like. Since acceptance of its truth is what matters, anything that implies it is a fact (e.g. getting excited, looking forward to it) can only help establish it. It's a bit like Erickson hypnosis in this way - thinking and doing things that assume the certainty of the wish fulfilled.

TL;DR: Creation of facts by acceptance and implication.

EDIT: Added more facts. ;-)

Off topic:

You made me think of this condition some people have called "Mirror Touch Synesthesia" [http://en.wikipedia.org/wiki/Mirror-touch_synesthesia], basically what people observe on a daily basis are physical and mental feelings that they themselves 'feel'. This one woman explained how her ankles started to hurt painfully as she watched a women walk down the street in ankle pain. She felt her physical pain quite literally. Also, regarding empathy - they also experience mental states of the people they observe. Thus far, people afflicted with this condition are unable to control it and usually lose their sense of self when in public and often resort to a hermit lifestyle as they cannot deal with multiple sensations/feelings. There was a good discussion on this on NPR's Invisibilia podcast, the episode was on Entanglement. Kind of makes you wonder what is really going on, what is real?

[QUOTE]

Synesthesia

Synesthesia (American English) or synaesthesia (British English) is a perceptual phenomenon in which stimulation of one sensory or cognitive pathway leads to involuntary experiences in a second sensory or cognitive pathway. People with synesthesia may experience colors when listening to music, see shapes when smelling certain scents, or perceive tastes when looking at words. People who report a lifelong history of such experiences are known as synesthetes. Awareness of synesthetic perceptions varies from person to person with the perception of synesthesia differing based on an individual's unique life experiences and the specific type of synesthesia that they have. In one common form of synesthesia, known as grapheme–color synesthesia or color–graphemic synesthesia, letters or numbers are perceived as inherently colored.

Mirror-touch synesthesia:

Mirror-touch synesthesia is a condition which causes individuals to experience the same sensation (such as touch) that another person feels. For example, if someone with this condition were to observe someone touching their cheek, they would feel the same sensation on their own cheek. Synesthesia, in general, is described as a condition in which a stimulus causes an individual to experience an additional sensation. Synesthesia is usually a developmental condition, however recent research has shown that mirror touch synesthesia can be acquired after sensory loss after amputation.

[END OF QUOTE]

That's really interesting, new on me!

One thought: that our personal boundaries are "imaginary", that at some point we create filters which give us a personal space. Without them, we are wide open to all information being leaked/broadcast. Perhaps this is what's going on. Normally, children learn they "aren't meant to" experience these things, and by implication don't, but these guys missed the memo.

I used to find being in open plan offices really difficult, even small ones. Just a constant sense of "exposure". Not vigilance or self-consciousness, just being too open. Over time, my awareness would contract further and tension would increase. My "little trick" to get around this was to feel-imagine a shell around me, a Faraday Cage for others' "presence". This imaginary "fact" was enough to make it better.

EDIT: I hear "sound effects" when I see movement, in real life or in gifs, etc. I only recently found out that this is a thing too.

POST: Is this more than coincidence and how can I test it

Imagining new facts into the world.

Your sensory experience is a 'mirage' floating within an aware space in which are dissolved the facts-of-the-world, all of which can be amended.

While detached from the present moment sensory experience, in a state of "absolute allowing" where we are happy for experience to shift without restriction, we imagine that something is true, and our subsequent sensory experience falls in line with the new fact.

Something like that, anyway.

POST: How can I use the occult to make me rich?

Q1: I've used the occult to make me rich, send me \$500 and I'll tell you how you can do the same.

Q2: Pfft, don't listen t this guy, send me \$499 and I'll tell you the truth.

Q3: Fuck that, send me \$9.99 and I'll tell you how to **BECOME A LIVING GOD**.

Q4: Ignore them. If you think in hundreds, you won't go anywhere. \$5.000 bill & we have a deal.

Adding more decimal places to \$5 isn't going to get you rich any faster! You wanna use a comma, like this:

\$5,000.00

Wealth is all about correct punctuation. Trust me; I know how to use a semi-colon.

POST: Origami as offerings.

Great idea. I'd like to see a whole new branch of the art called "Sacrificial Origami". Could be much fun had.

Love the name. Now how do I represent virgins with origami...

White paper, obviously. Might be tricky doing the fine detailing...

POST: How often do you use thought experiments in your day?

There's a book called Busting Loose from the Money Game (a later edition refers to it as the Business Game) which takes a similar approach.

It presents itself as a business book, but is really more of an 'occult/enlightenment' book in disguise. The main idea: When bad things happen, and you feel discomfort, treat them as "eggs" that are dissolved by using "The Process" to "reclaim your power": basically, welcoming them and sending gratitude/love. For instance, send gratitude for the bills you receive.

Eventually, you will have dissolved all the "cloud cover", and the "open sky" of conscious flow will be your experience from then on, in matters of money and more.

Someone has a summary of the main points here. [<https://sundayupdate.wordpress.com/wp-content/uploads/2013/11/key-points-from-busting-loose-from-the-money-game.pdf>]

POST: How do you see entities?

There are many hallucinations that form within your vision, called phosphenes. When you close your eyes and see all sorts of splotches and colors, these are phosphenes: seeing lights without light actually entering the eye. These are the clay from which you sculpt visualizations and, when you're asleep or in a hypnagogic state, dreams. It's hard to do at first, but after practice with your eyes closed, you'll be able to create phosphenes in accordance with imagination and/or memories. You'll almost swear that you saw outlines of a particular scene, even for just a moment. After practicing with your eyes closed, you can try doing it with your eyes open, albeit in minimal lighting. Eventually you can use phosphenes to visualize anything in broad daylight. Entities communicate with us and appear before us in the form of phosphenes, at least from my experience. When an entity makes itself known, you may notice discoloring, or just some sort of form that lies before you. You may not actually "see" it with your eyes, but rather you can sense its presence with the phosphenes, a kind of sight that I associate with the "Third Eye" vision. If you're sensitive enough, you can probably interpret random flowings and distortions as spirits that are popping in and out of your field of view, though this is an ability that usually only belongs to shamans or channelers. Most people can see major entities they have called or are at least open to noticing. They are invisible to those who are not open to their existence.

Are these phosphenes (those "sparkles" that become "things") or are they random flickers of hypnagogic type imagery, do you think? Are they totally in the mind?

Q1: The little white sparkles are white blood cells moving around your eyes. Different story, but I haven't really tried to use those in visualization. Could be possible, but I don't think I want to mess around with my body's defense system.

Q2: Not OP, but I would describe my personal experiences as hypnagogic. I thank God there's a word for it, even if it's a word no one knows! (except here) My visualisations are induced waking hypnagogia, as far as I can tell, and sometimes it's not induced. I just see... things. Anyway, it explains my continued obsession with dream work.

Yeah, I was doubtful about this "phosphenes" lark. I think of the initial background stuff as random "mind noise", a sort of pure background creativity, which then coalesces into fragments and imagery - and worlds. And I think it's always present, waking or relaxing or sleeping. The stuff that dreams are made of...

But everyone seems to have a different way of describing it, so it's hard to pin down whether we're all having the same experience.

POST: ShowerThought on Visualization

[POST]

I wasn't really in the shower. Instead, I was in the car listening to NPR's "This American Life". The show was about this blind guy who can ride a bike just like a seeing person. He basically uses echo location. It got me to thinking about how, really, everything we see is constructed by the brain. I take in information through my eyes and my brain constructs something to see. This blind guy, he takes in information through his ears and he seems to see just fine (really worth listening to the episode). He hikes and bikes and climbed trees just like if his eyes worked. Anyway, I had this thought: what if I am blind and just don't know it? I'm not really blind. I mean, I don't think so. But, for a moment I looked at the world around me and thought, wouldn't it be interesting to learn that, this whole time, my eyes didn't work? I dunno, it gave me a different perspective on visualization.

[END OF POST]

Q: Your post does raise interesting questions about the nature of perception, but it's very important not to overstate the man's ability. He is able to "see" yes. But he and the show's host make it out to be more akin to peripheral vision than traditional vision. None of the acuity, but still plenty functional and better than total darkness. If this sort of thing gets you going, you'll also be interested in a device known as BrainPort I'm also reminded of someone on this sub who claimed that while meditating deeply, they were suddenly able to see their surroundings without opening their eyes. I'm more skeptical of this claim, but I wouldn't rule it out completely, and it's definitely an interesting thought.

I think the seeing-through-eyelids thing might be related to the "Darkroom Vision" phenomenon. I've had it myself when very relaxed, with my attention (where I feel I'm "looking out from") rested near the middle of my head.

When you look at how your eyes work, then it becomes obvious that you are not really seeing with them. In fact, the attempt to "use your eyes" often leads to your vision narrowing and becoming less focused.

In fact, thinking in terms of senses is maybe a bad move generally. If you sit back, as it were, it seems far more like you are "receiving a world that appears in your mind". It might be 'inspired by information gleaned from your sensory apparatus' but that's just feeding you snippets of info, which trigger patterns in your mind which constitute the actual experience.

The "Darkroom Vision" phenomenon - check out some of the links - and some of the stuff discussed in Ian Watson's book You Are Dreaming highlights that our usual assumptions-of-convenience about perception are obviously wrong, and that we basically always "dream our experience", inspired or not by the senses.

POST: New to magickal practices; starting with meditation, trying to lucid dream, and sigils; just want to clarify something

It's all just making a decision, and letting your mind or the world go there by itself.

If you set a problem, and don't resist movement and change, it'll gradually turn into the solution by itself. What is a 'desire' if not a 'problem', a tension that is to be [re]solved? The decision you make is largely about making a commitment to not resist the flow towards your goal. A decision itself is therefore always an act of intent and will. Effectively:

"[This decision means] I will have a new car".

Although most people like to feel themselves "doing" something, so in effect offset the process by one level:

"[This decision means] drawing this picture means I will have a new car".

Magick as described is mostly just theatre in experience. We do it because the actual active core of magick - intention or will or allowing or whatever, the release to and commitment to the flow of the world - cannot be experienced as an action.

EDIT: That's not to say that this "theatre" isn't valuable or powerful. There are many reason why it can be beneficial, not least because ritual can give you a direct feeling of connection to "the source", consciousness, your true self, whatever - which helps commitment, resistance and faith somewhat.

POST: Your goals.

Basically, I don't like not being "in the know" when it comes to secrets, and the cosmos holds an awful lot of them. I want in.

Is the background whispering of the Cosmos making you paranoid? ;-)

Not paranoid: more like hungry, in a manner of speaking.

I was joking, but I know exactly what you mean!

Keep in mind though that the 'Cosmos' isn't a static thing filled with secrets and information, like a library or a science experiment; it's alive and responsive to you.

It tends to give you an answer when you have a question, to give you a landscape when you open a door - it makes up stories for you when you go looking for them. Problems turn into solutions, requests turn into responses, the seeker is given an ongoing adventure, to expect is to receive. It happens all by itself.

The 'secret of the Cosmos' isn't to be found in any of the specific experiences you'll have, of course. They're just dream-fun. The secret is how the Cosmos gives you those experiences at all!

He who knows, does not speak. He who speaks, does not know.

"... "

[question] magic is real. is psi real?

I suppose what I meant was, if it was possible, why isnt it more common? And what precisely have you learned to do? Telekinesis is like a blanket term and I'd like to know what you meant by that

Looks a bit like James Hydrick's dollar bill trick [https://www.youtube.com/watch?v=30o7_jy-O1g&t=18m20s]. Is the commencement of movement synchronised with your breathing?

Not saying that's the explanation or that it's intentional, but you need to be careful to exclude these possibilities in your experiments - both breath motion (very slight gaps under the container) and thermal changes (heat from hands or breath warming one side of the container slightly, resulting in air currents inside). With such a finely balanced object, very small changes could make a difference.

EDIT: This is a more general problem: magick always finds a way to give you the experience you truly ask for. But sometimes it can do it in an underhand way, if we're not careful.

Q: Not saying that's the explanation or that it's intentional, but you need to be careful to exclude these possibilities in your experiments - both breath motion (very slight gaps under the container) and thermal changes (heat from hands or breath warming one side of the container slightly, resulting in air currents inside). With such a finely balanced object, very small changes could make a difference.

Totally get what you're saying. I spent months checking and cross checking. I grew up being asked questions and being shown different ways in which physics works so I'm pretty familiar with countering those things. I did not allow myself to even accept the results until I was confident. This is something you'll have to learn on your own since videos never show what is going on within me. And yes, breathing is one of the many ways that you can synchronize energy flow. Not necessary but can be a very easy thing to fall into when you're first learning.

I should mention that I have spent hours staring at the wheel and have gotten very familiar with recognizing what is driven by the elements and what is driven by me. I can feel the energy move through my body and then pass out of my hands to make the object move. I've also tried blowing on the edges of the glass in all directions to verify there is no air flow happening. I have sat there with my hands directly on the glass and never once had the wheel move until I tried moving it. I've checked for static by rubbing my feet across the carpet, getting the wheel to follow my hand using the static and then discharging the energy by touching the energy saving bulb of the light on the stand only to have the wheel not move from static any longer before I start practicing. Something fun about static is that it can be manipulated. If you try learning to do this I would recommend being patient and do lots of meditation.

This is a more general problem: magick always finds a way to give you the experience you truly ask for. But sometimes it can do it in an underhand way, if we're not careful. I agree! Magick can definitely give what you want like that. The static was the original way that it started, then I was controlling air movement, and now it's directly related to my ability to move psi or chi. My only hope of showing this to folk is to inspire them to learn how and to help them to start developing spiritually. Come join us in /r/energy_work if you haven't yet and start discovering out what you can do.

Thanks, that was very informative! Sounds like a pretty thorough experimental approach.

Magick can definitely give what you want like that.

I guess (know) the trick is: specify the route. And you're right about really having to explore yourself. A couple of thoughts:

- Do you think this is related to, say, the "stretching out of presence" one can do to make contact with other people?
- Do you think this could be done eventually without a direct connection?
- Do you think that attempts to demonstrate this sort of thing with other people present, presents a problem? That the fact of an observer can cause difficulties? Perhaps because of the concentration required, perhaps due to "conceptual momentum" (the idea that being in the presence of conflicting beliefs is like a "counter-will").

I have duly subscribed! You might also be interested in checking out /r/Oneirosophy.

what I like to call consciousness, outside of our physical shell and having it interact with other things.

I call it "presence" to distinguish it from the background awareness that also gets called "consciousness" - Peter Ralston calls it "feeling-awareness" which is not a bad compromise actually. I might take issue with "physical shell" and "things" but that's a different thread!

So, implicitly, we all have a direct connection, even if our locations differ - eventually I might be able to render an effect at a greater distance...?

Our brains [I'd say minds] love patterns and it likes to make everything automatic.

It's all about the patterns, so true! Patterns, memory traces, automatic habits. The very stuff of the personal daydream! :-) I'd suggest that improving one's ability to create "out of the ordinary" effects depends precisely on softening these patterns, directly (addressing them specifically to dissolve them) or indirectly (repeated practice to wear them down).

Anyway, lots to explore! Thanks for giving me a new angle on this, something new to play with.

I still believe that everything is consciousness so I'm wondering how this can be accepted into or break my current view.

Everything is still "made of" consciousness - but just as sight, sound, touch are perceived as separate "modes" of consciousness, so "presence" is a mode. You might think of it as extended, subtle touch?

Going to write up another post soon which covers the other stuff, actually.

Quickly though: Try and actually find your body right now. Use your attention or "presence" to feel it out. You'll realise it's basically a big empty space, in a big empty space, with no solid boundary. Some people find the Douglas Harding experiments helpful, and you might like the one I describe here [Outside: The Dreaming Game] - in the middle.

Try 'em and feel free to PM me if they do/don't make sense!

Let me know when you have that post up if you happen to remember. I'd love to see what you write. Cheers mate!

Ah yeah, sounds like you're on it.

Will say though, that the experience you should eventually have is beyond just the body sensation - it should feel like those sensations are floating in empty background space, without there really being a "body" that connects if all together. That's what helps you realise that "you" are actually over there as well as over here - it's the difference between thinking that everything is consciousness, and actually experiencing it to be true. You are the background. (Check out this interview for Rupert Spira trying to get someone to get this.)

Will do. Cheers!

...

When you pick up a rock and throw it, you are not using mental power to do so.

You might ask though - if that's not mental power, what are you using to get your arm to move? What is the name for that and how does it work?

POST: How to start out.

"Meditate for at least 20 minuets every day. If you don't do this you are wasting your time in the long run". I see this pop up every day. thoughts?

Sort of?

- "Meditation" in its loosest sense, sure. Just lying on the floor for 2 x 10 minutes a day, letting your nervous system relax out and unwind, does the job.
- "Meditation" is the ongoing sense too: not "forcing" your mind or body as you go about your day, letting things unfold at their natural spontaneous pace.

Basically, if your "aware space" is cluttered up with "stuck thoughts and incomplete movements" then you're going to have a hard time perceiving how things are, where they are going, and find it difficult to tune into and direct things.

If you sort that out then you are inherently less scattered, and will find results naturally easy (easier!) to access. Actual ritual and action detail not necessarily mattering so much, since it becomes more about the decision of meaning (c.f. Alan Chapman, etc).

EDIT: You might find this recent post of mine of interest [Overwriting Yourself], or not.

POST: I'm going to start a business this year, but I know for a fact that a certain crazy person has a grudge against me, and he's really deep into the occult. I'm pretty sure he's tried to curse me before, and worried he might again.

AI: If there is truly someone out there actively working on doing you harm, then you're only validating it by worrying. You're doing most of the hexwork for him already. But, chances are, he's not. Your source of anxiety is opening the business, and you're looking about reasons for your anxiety. Be a wall. Don't worry. No one can touch your life. Plow on ahead with your plans. If someone truly had a grudge against you, then "the best revenge is a life well lived" So, just go and be successful, ok? Edit: hey, my first gold, and it wasn't about something fucking stupid. Woo!

This x 10.

Just keep focused on what you're after; don't entertain ideas of others' influence. If you make your future certain in your own mind, no other can interrupt that. (And in the end, they are kinda you anyway: your own anxieties or self-destructive tendencies might manifest as "someone else hexing you".)

POST: Rationality in your practices?

Q:[Deleted]

Nice comment. Although we must add the special sauce of the conundrum: The concepts we adopt affect our experience of the world, of the objects and narrative we encounter. So it's difficult to be truly science-like objective with magick. Doing so can destroy the effect.

No need to make things more complicated than they need to be. Either you have objective evidence (with scientists present to rule out trickery), to support your systems do something, or you don't. Easy Peasy

Do upsetting memories make you feel sad?

No. What does make me sad though is that people who want something real wind up giving up on the search, because virtually everything everywhere is lies, disinformation, roleplay and make believe nonsense. Real practices are actively suppressed in this and other similar communities, in favor of practices that generate only subjective results. It's almost as if paid government shills are actively trying to bury real practices with disinformation, and discredit them. That does make me sad. It also makes me sad that out of a thousand spiritual seekers maybe one or two, understands why objective evidence is important, and why we should demand proof that systems actually do something. The rest think you can brew potions, and chant incantations, and draw sigils, and swing around an athame and it will have any meaningful effect at all. That does make me sad. It also makes me sad that the people who would most benefit from real practices are so burnt out fake spiritual bullshit, and make believe nonsense scams that pass for spirituality, that they wind up becoming raving Atheist skeptics. I can't really blame them, with all the lies, disinformation, scams, hoaxes, etc. It's sad though, no amount of evidence would ever be enough for them.

Well actually I was building on the objective evidence aspect - I can't objectively detect memories nor the feeling of sadness in other people, so they must be excluded from my model of the world - rather than the larger issue of delusion or misleading groups.

We've talked before I think, but my own investigations have led to the conclusion that, simply put, power is in plain sight - for all to see and utilise if so inclined.

You can't know for certain if someone is really sad, or giving a performance of being sad. You can know for certain if someone could demonstrate real abilities objectively to scientists or not. There is the difference friend.

Uh-huh, but magick's most important abilities are psychological... in one sense or another. That was my point - that for those things it's subjective evidence that matters, one proves to oneself. So we can't discount the value of those things, just because they are difficult to prove objectively. In fact, it can be baked in, that problem.

Of course, that's separate from real objective abilities. It just important to be clear there are two strands (at least), and being well versed in one doesn't mean one can be dismissive of the other (in terms of its value to other people). A lot of these subreddits are more for one type than the other.

Wow, I sound so even-handed there. I'm not really, normally! :-)

Let's cut the bullshit friend. Either there is good objective evidence to support your practices do something, or there isn't. I've met plenty of magick users, and all of them are dirt poor, drive 20 year old cars, live in their moms basement, are miserable failures at life, but boy their magick sure is strong. I ask them what has magick done for them, and they go off on all the subjective benefits. From an outsiders perspective the only metric of success they have achieved is keeping themselves spiritually entertained. You either want something REAL, something you can prove is real in the presence of scientists, or you don't. It's that simple. There is no need to write a doctoral thesis on metaphysics to figure this one out, friend.

But... I love my Mom's basement! So comfortable in the dark, with my 1990's video games! :-)

Hey, as I said, we talked before.
S'all good, each to their own, and whatever they are satisfied with.

POST: What technique (s) do you use to focus your intent?

It's ages since I've done meditation formally. I've found that anything that moves/expands/dissolves localised attention is helpful; anything you 'let go to' that isn't thought-based.

If you are one for habitually being stuck in your head, exercise expands you into your body. If localised to your body, contact with the external environment expands you into that. Painting and drawing encourage you to "reach out" with your feeling-awareness towards the subject. Gradually, that persists, and the "information" stored at those locations (the oft-ignored rest of your body, beyond perhaps) produces insight occasionally.

Interesting that you did it with the lights off - one of the best ways I found to realise that I wasn't restricted to "here" was to ignore vision, and attend to where sounds or body sensations were - it's much easier to directly realise that they occur in a "large space of awareness" with eyes closed than with eyes open. Something to do with the persistence that images have in insisting they are "over there" rather than "in here".

Another sense was being exercised.

Can you try to describe that a bit more?

Reminds me of Luke Skywalker training while while blindfolded with against floating laser beam shooting robot orbs. Same idea. You have to anticipate what is going to happen before it happens. I do think it helped me to develop an almost predictive reflex. At the time I felt like it was magic. Maybe it is?

It sort of is! I recommend it all the time, but this book by Missy Vineyard is great on the subject of 'letting things happen' when catching balls and doing other tasks. Meanwhile, this book by Peter Ralston is good on the idea of feeling-awareness.

It's basically a sixth sense, that - the "feeling out" sense. You can do it deliberately when attending to things (exploring), but also you can get the benefits by letting go (responding).

I like the idea that, at its core, we are deciding to let the environment move us appropriately, rather than holding onto our separateness and trying to control reactions manually. It takes a bit of faith, though - because there's no knowing what your reaction is going to be, you just have to trust that it will be appropriate; it happens faster than information can travel consciously.

(I always wince when watching those get-hit-with-a-stick exercises! Where's the blooper reel for that stuff? Bet it's messy.)

The two books complement each other nicely. Also, I quite like Alan Watts on this "the environment moves you" thing:

[On letting go and living in the present, unprepared,] people immediately say, however, “Now wait a minute. That’s all very well, but I want to be sure that under such-and-such circumstances and in such-and-such eventualities I will be able to deal with it. It’s all very well to live in the present when I am sitting comfortably in a warm room reading this, or meditating, but what am I going to do if all hell breaks loose? What if there’s an earthquake, or if I get sick, or my best friends get sick, or some catastrophe happens? How will I deal with that? Don’t I have to prepare myself to deal with those things?” “Shouldn’t I get into some sort of psychological training, so that when disasters come I won’t be thrown?” That, you would ordinarily think, is the way to proceed — but it doesn’t work very well. It is much better to say, “sufficient unto the day is the trouble thereof,” and to trust yourself to react appropriately when the catastrophe happens. Whatever happens, you’ll probably have to improvise, and failure of nerve is really failure to trust yourself. You have a great endowment of brain, muscle, sensitivity, intelligence — trust it to react to circumstances as they arise. Zen deals with this. Studying Zen will change the way you react to circumstances as they arise. Wait and see how you deal with whatever circumstances come your way, because the you that will deal with them will not be simply your conscious intelligence or conscious attention. In that moment it will be all of you, and that is beyond the control of the will, because the will is only a fragment having certain limited functions. I know that this sounds impractical to some of you, or perhaps revolutionary, or perhaps not even possible, but it is simply living in the present. It requires a certain kind of poise: If you make exact plans to deal with the future and things don’t happen at all as you expected, you are apt to become thoroughly disappointed and disoriented. But if your plans are flexible and adaptable, and if you’re here when things happen, you always stay balanced. As in movement or martial arts, keep your center of gravity between your feet, and don’t cross your feet, because the moment you do you are off balance. Stay always in the center position, and stay always here. Then it doesn’t matter which direction the attack comes from; it doesn’t matter what happens at all.

If you expect something to come in a certain way, you position yourself to get ready for it. If it comes another way, by the time you reposition your energy, it is too late. So stay in the center, and you will be ready to move in any direction.

-- What is Zen?, Alan Watts

And that's all my book references done for the day! :-)

Right on tack with my own experience! I was very into the Zen concept and the practicing thereof when I was a teenager. Fishing and spending as much time in the woods in silent openness as much as possible was my introduction to it long before I read about it. Actually, I was a little disappointed to find out what I was feeling and knew was already well known and ancient. But that was a typical teenage reaction. I'm not special anymore blah blah blah. Kind of funny now.

The fact you lead right into it gives me joy. I used to read Zen Koans and poetry when I felt off track and off my center and it would clear my mind and settle it for a while. What turmoil we put ourselves through!

Thanks again for the links and reminder. Bringing me back to myself, this whole thread.

Hey, your post reminding me to remind you helped me remind myself! :-)

Of course you are special; it's just that so is everyone else...

...

You should check out the Carlos Castaneda series.

Yes! His quote on intention really made everything clicked for me:

“To intend is to wish without wishing, to do without doing. There is no technique for intending. One intends through usage.”

-- Carlos Castaneda, The Art of Dreaming

Q: Wow, that takes me back. When I read the series back in my younger twenties, I kept a notebook of every good quote I read followed by whatever thoughts they inspired. Wish I had that notebook still! No idea what happened to it.

Same here! That quote is my favourite, because it really gets down to the fact that there's not one thing affecting another: you are 'first cause' and move yourself by yourself with yourself.

...I've had a bit of success re-acquiring notebooks for people lately, as a matter of fact...

Re-acquiring notebooks? What do you mean?

A converstation I was having elsewhere. Could still turn up, you know...

I think I need to get in the mindset to reread without trying to relive or recapture, to start where I'm at, ya know?

Yeah, sometimes a "reset" - or the acceptance of the reset - can be just the thing that's needed.

POST: Some shee folk i met in a lucid dream

TIL, lucid dreams are rare for me, and when I get them I tend to get a bit carried away. The last time I encountered an entity she was super scary but i stood firm and faced her down and broke her, this made me think that this is all i have to do, that because it's a dream i can't be harmed.

Yeah! In a dream, you are the dream and not the "character" you seem to be. So everything you encounter is a bit of you, the larger you. So there's always more to it than just, say, cool imagery and fun stuff to do. It's filled with meaning, to some greater or lesser extent. Facing up to fears is classic fun.

So would you say that the characters that I encountered are manifestations of my own subconscious and therefor the names they gave me meaningless?

No, not meaningless. It's maybe better to put aside the notion of the subconscious, and instead say that - from the perspective of 'little you' - the 'universe' is talking to you, giving you messages or challenges to help you. The dream may be "all you", but the fact is you do identify with one part of it, one perspective. However, the rest of it all has meaning for you, because it is part of the 'big you'.

(Sorry, that wasn't very clear probably.)

EDIT: Keep in mind that "finyacluck" is just a dream character you are seeing through the eyes of, and 'finyacluck" is at the same level as any other dream character. It represents part of the whole that you are; it just so happens that you are attached to "finyacluck"'s perspective and so you confuse it with being "you".

Thank you for explaining, and apologies for my very basic, newbie questions, the only thing now that's on my mind is if anything I encounter whilst dreaming, given that I didn't try to contact it earlier, has the ability to interrupt my waking, day to day life?

Well, the changes you experience in a dream do overflow into waking life (because you have changed), but you don't need to worry about "beings" following you. If that is a concern, then simply perform some sort of banishing ritual that seems persuasive to you. Simply declaring is sufficient for this, until you feel comfortable. And don't worry about "newbie" questions; none of this is obvious and it's all still under debate. That's why it's a personal exploration/journey of discovery!

POST: Question on sigil magic. Re: no harm...

Is the "poor guy" as real as you anyway...?

But, if you want to avoid the experience of getting a job because someone else was apparently fired, you just need to be more specific about what you request. Or intend more directly, directly into the 'external' world. Sigils and servitors tend to operate according to your own established habits - hence, no materialisations etc, plausible unfoldings only. So perhaps experiment with taking control of the situation "personally".

POST: What was the most Epic Fail you ever had from a spell that actually worked?

Good story. You should have kept going though. First attempt can give you the easy result (you dream of your desire, you see a drawing of what you want, or some other reality-joke played on you). It's saying: "Are you serious? Then commit!"

You were probably half-hearted in your intention.

Not to say you are going to wake up the next day on a mattress stuffed with money. In a beautiful house. With a beautiful wife. But you may ask yourself...
[<https://www.youtube.com/watch?v=kvM6TxUnCDE>]

My tendency is to end up seeing films which have scenes depicting what I want, or reading passages in books. I see it as a sign that I was "heard" and to keep pushing...

Q: In total agreement. This is how I (make every effort to, anyway) operate now. If I see something (a photo, an overheard conversation, etc.) that is representative of my own "heart's desire", I have gotten myself to a place where I can rejoice over that.

As in, if I want a trip to Europe - and a co-worker comes in and says she is unexpectedly able to travel to Europe, I rejoice (even if said co-worker may not be my favorite person). If I feel a twinge of envy, I... not so much "quell" it... but transform it, as best I can, into genuine gladness for the other person. I also see it as the Universe (ha - yes,

sort of ME -) bringing my own wish a little bit closer to me, and still a little bit closer to me.... If a bunch of people around you seem to be getting what you want, believe the Universe loves you and hears you and that the THING is being drawn closer to you, instead of that the Universe has played a joke on you and you should quit. To me, the Monopoly houses & money by the bus stop sound like an amazing "yes!" sign. It's saying, "You're kind of vibrating to your house and your money. Here's some inspiration to help you along!"

ALTHO' "quitting", ie "dropping the seed into the ground" can be quite effective. "Quitting" is what brought the "bf" from my other story BACK after 2 years, so he could break my heart even more effectively by leaving again a year or so later!! (Moral: Discernment is needed. "Know thyself!" Just 'cause you wanted something desperately 2 years earlier doesn't mean you're obligated to say "yes" to it whenever it shows up. :)

"Dropping it" is easier to do with the little things, the "it would be nice but it's not urgent" things, like my chair. (I used Deepak Chopra's meditation to arrange that; I bought a worth-\$300-or-more wing chair for \$10, carried to my doorstep, no less.)

I also try extremely hard to stay positive and um... silent. For instance, IF I've recently failed to do this ("stay positive", that is) - today or any other day - I would not tell you about it here! :p

Hey, great response. There's also the fact that people don't dedicate themselves enough to this, don't really commit. If you were told that, to get something you want - a complete change in your reality - you should lie down, let go, and simply strongly intend that for a day. Just assert that it is true already, without compromise. Would you do it? Basically, almost nobody would. This guy [POST: one way to get whatever i want] has the wrong intentions but the right dedication.

I also try extremely hard to stay positive and um... silent.

Yeah, it's a challenge. It helps, though, once you realise you don't need to be "thinking positive thoughts" all the time, so much as only intend positive things. It's about what you put yourself behind. If you remain detached usually, then no stray passing thing will get energised; if you spend your days being hyped up, then your dream will be all over the place.

Crowley said to use magick like this to fix sickness is deplorable.

I'd never heard that. Looking up quotes, the best I could find was:

Crime, folly, sickness and all phenomena must be contemplated with complete freedom from fear aversion or shame. Otherwise we shall fail to see accurately, and interpret intelligently; in which case we shall be unable to outwit and outfight them.

-- Appendix VI : A few principal rituals – Liber Reguli.

So, is it more that it is folly to ignore the message and learn from the sickness? That would make sense. In other words, forcing "feeling better" on top of the underlying cause, which has not been reached into and dissolved.

very good point! I'm not sure where I heard that then.

Also, could a sigil backfire if given a silly time frame, for example "By tomorrow"?

There's no reason it can't happen semi-instantly. For instance, a friend of mine was very sick, 10 minute gaps between "visits", and did the thing: "I wish I had a magic potion to cure me" (or similar). Later, he suddenly knew he had to go and buy a bottle of rum. He watches his timings, gets to the store and back again, downs the rum. Wakes up a few hours later, cured. I feel that when the phrasings play tricks on us, it's really us being tricky with ourselves. Any slight lack of conviction or confidence on our part, and the wiggle room will be used to make it happen "off-centre". In the story above, you've got to think that his 'larger self' was having a bit of fun, sending him on a journey outside for a distance was that going to need near-perfect timing, but was doable - just. He rose to the challenge, he gets his reward!

Meanwhile, you can skip phrasing altogether, by simply lying there and directly intending into a "feeling-state" of health. Basically, deleting/overwriting the (now temporary, historical) fact of illness. Become the larger you, and operate from there (outside > in), rather than being the small you, sending out wishes (inside > out).

This is fascinating! Any books on this technique of operating from the larger self?

You really need to feel it out for yourself - become aware of the larger background in which your experiences (thoughts, sensations, etc) arise and stand there as that, rather than as the mind or the body. Expand your presence into the world. Neville Goddard's "summon the feeling of the wish fulfilled" technique, detailed here [<http://www.thepowerofawareness.org/>] for instance, is an approach. (Do a daily "update" of the universe each night to realign it with your desired version.) The feeling-awareness exploration of Peter Ralston is also helpful. Mainly: experiment. If you 'send requests into the universe' then you are implicitly asking for the universe to do something on your behalf, as a separate entity. If you 'become' or 'recognise that you are the universe', then you are operating as first mover. (See Alan Chapman for how implicit assumptions affect work.)

Main final thought: This stuff, even the "direct" stuff, happens indirectly, in that you are operating at the "enfolded" level of experience, which subsequent "unfolded" objects and events will manifest in alignment with. You never really create that Ferrari, rather you update the "enfolded schema" of your world such that ownership of a Ferrari is part of it; subsequent sounds, images, feelings and sensations that arise in awareness will then unfold from that updated schema.

(Sorry, not sure that was very clear.)

EDIT: Remember that you are always your larger self. Sometimes you forget it and pretend to be a smaller self.

EDIT2: Another way to think of this is that each moment appears anew, unfolding based on the "enfolded schema", then disappears - and a new moment appears. The unfolded moment itself is transparent, it has no substance, and can't be altered. However, by updating the "enfolded schema" you have effectively "re-seeded the universe", updating its blueprint or script, so that subsequent moments will arise consistent with that modified architecture.

...

Good story. I'm finding, the less specific you are the more you are vulnerable to your background beliefs of: a) what is possible, b) what you deserve. If you secretly believe you don't deserve something, you'll set 'tests' for yourself so that you can 'prove' you are worthy. If you think that you must work hard for everything, then stressy-hurdle-jumping will be your world. If you weren't willing to work for it, I wonder what would have happened.

...

Q: Wanted specifically "a large amount cash" to "appear in my lap." The next morning my friend called me who I haven't seen in 3 years asking if I could watch her relatively large pit bull, Cash.

You were lucky. Circumstances could have forced you into a life working at a strip-club, say, where indeed large amounts of cash would have "appeared in your lap" - when you were with your "special customers". Tricky stuff, this.

Tricky, yes. But could the pit bull Cash have been a symbol of the "real cash" to come? I mean, the very next morning, after 3 year absence. Hmmm. The You-niverse on the move. (That is a funny story. I wonder if Res_hits did wind up pet-sitting and if Cash ever actually got up in his/her lap....)

Like other stories, often the first "comedy" response is a little tester. It's like "hey, I'm listening". So you should keep pushing on. Half-responses are perhaps a sign of half-hearted intention, as I said on another... oh, looks like I'm going there now > > >

Would't it have instead been a stripper being on his/her lap? I mean, if it was a good night for the stripper...

...hmm, so a life going to a strip club, and a girl called "Candy Cash" or similar sitting on their lap?

...

Q: What makes you think the occult isn't of the devil? Is there good and evil in the world? Did someone actually create this?

AI: Occult simply means hidden and the most famous Religions believe in a lot of supernatural stuff- better said- they have faith in supernatural things, but don't ask them if they want to be a part of it because it simply scares the shit out of them... as an Occultist you investigate this supernatural. So in a sense- most people in our current time that believe in God came about this through Judaism, even though the idea of God is older than Judaism. If there is God- then there must be Spirits- if there is a Heaven, then there is an afterlife. So- if you buy into the Abrahamic Mythological Trilogy then you accept Angels, Demons, Other Planes of Existence as FACT. With that being said- God rewards and guides those who are aware of it's existence; even if people choose to view said God as a simple point of reference. From my own experience- God represents a Guidance System directed towards Goodness. It recognizes ones desires, wants and needs- it gives us those things when we ask for them as long as we are an active part of society- that way he (god or the universe) can work through the people of the world. Now... to answer your question- I don't think the magic that I've experienced in my life has anything to do with the devil. I think weakness, immaturity, arrogance are real human traits- I also feel that once we are in positions of power- we sell out and lose the plot along the way. The Higher Voice- God- The Higher Self- Guilty Conscious- Moral Compass- Virtue- it's always there and from what I've been able to research it's quite general. This inner goodness becomes a distant background intuition or telepathic voice after we slowly or rapidly give into the pleasures of life at the expense of others- including ourselves. I've certainly learned when dealing with the magic of this world- there is no one to blame but ourselves if things get out of hand. After a certain point in ones maturity- he or she becomes self-aware enough to trace back all the steps that made them 'fall'. Some choose to blame 'The Devil' for their own weaknesses. In Judaism- The Devil is simply there to tempt man. To see if man's intentions are pure enough to deserve honest power. Most men do not possess sufficient wisdom and knowledge to decode the archetypes and symbolism that permeates through himself and the world around them. Instead- they run into pit falls and point the fingers are others for their own mistakes in life. As I told another user- everything is sort of like a ladder- or an alphabet we have to go through in life. Some people simply get stuck in certain psychological patterns- and it's not always their fault either- our society simply doesn't support naturally provided protocols intelligently designed to upgrades ones perception of themselves and the world around them. We get caught in the mote- hurt ourselves and those around us- even when we claim to love them. It's not the Devil- a particular deity that is out to get you- it's simply Man having to deal with his own maturity- self-responsibility- integrity- awareness- ect. I mentioned about the Judaic Devil simply to show him as a mythological archetype- a symbol for a reoccurring stereotypical human trait. We can be weak- we can be ignorant- we can be assholes- ect- When we misbehave or become addicted to certain substances people claim to be possessed by demons. The demon is an archetype of an amplified negative thought pattern which has enslaved the person. There are ways to go about ridding a person of these psychological entrapment's- and once they realize that it was simply a thought pattern- their perception of what that thought pattern might change. Instead of continuing to believe it was some Devil- they might realize, it was simply themselves. Then you might ask... what about God? I think God is the Universe! It's everything you can observe objectively. However because we are a natural part of the objective Universe- God permeates within all things- planets, plants, animals and humans. We sense God in ourselves through our conscious. Is there good and evil? Yes absolutely. List of Good things... Virtue, Wisdom, Knowledge, Community, Appreciation, Sharing, Love, Selflessness, Integrity. Bad things... Rape, Murder, Profiting from Ignorance and Suffering, Extortion, Blackmail. I believe we can truly rise as people- together and recognize that there are certain factions of the system which propel evil and because of this- there is a lot of suffering and natural born development of good and bad rebellion. Perhaps I went a little too over the top with my response- hope you were able to appreciate it. Thanks. Sincerely. -AI

. . . God rewards and guides those who are aware of it's existence; even if people choose to view said God as a simple point of reference. From my own experience- God represents a Guidance System directed towards Goodness. It recognizes ones desires, wants and needs- it gives us those things when we ask for them as long as we are an active part of society- that way he (god or the universe) can work through the people of the world.

What a great way to put it - thanks for that thought-provoking reply. Interested in your "part of society / work through people" idea. Could you expand on that a bit?

AI: If you desire something- you must be willing to go into the world so that it may reach you. You gotta be willing to meet 'God' half way in a sense. Lets say- you are looking for a specific material possession or experience; it doesn't do you any good to lock yourself up in your home indefinitely. Desires are found out there in the community / society- through networks- friendships- relationships- ect. It usually happens through a domino effect of coincidences and before you know it you are in front of what you originally wanted. Watch the Jim Carry film- Yes Man. I am not saying to be unwise about the opportunities that come your way but we naturally tend to not go along with opportunities due to lack of trust and fear of the unknown. Also sometimes life simply gives you what you need instead of what you want. There is always a lesson to be learned- even if you are not able to achieve your goals or you do achieve your goals but then fuck up. Instead of becoming angry- take a moment and retrace all your steps; things should add up if your attention span is broad enough. Thanks. Sincerely. -AI

Nice. Thanks.

...

Q: Well, I told TriumphantGeorge I would leave these forums, for I am "divesting myself of my stories" (which is great; I love it,) but lo! here I am with a story. Altho'... I don't really wish to tell it in first person, so I'll use the "let's call her Jean" tactic, which I've never liked!
Okay - so, let's say we have Abby, Bonnie, and Cara (ABC). (These folks are all in their 40s, at the time.) Abby is deeply in love with her bf, who dumped Bonnie to be with her. Abby is shy and reserved. The bf is striking and has women falling all over him all the time. Bonnie is stridently persistent, and will walk right up and grab bf's arm and drag him off when he is with Abby. (note: bf is a player; he cannot help it) Soooo, Abby detests Bonnie, who is originally from another city (Boston) 500 miles away. "Just for fun", having no idea what she's doing ('tho she should have, having "manifested" a beautiful chair easily, & other things,) Abby begins to indulge a fantasy in which Bonnie is packed up (safely) in a big box which is all taped up and shipped to Boston. Abby loves this little fantasy, and visualizes it over and over again, enjoying the idea of detestable Bonnie in a big box on a freight train, swept off to Boston. Haha! Harmless Fun!
Well, after a little while Abby's very best friend of 20 years, Cara, who has always been local, tells Abby that her (Cara's) husband has been transferred to... Boston!! A city they've never been to! A city that never crossed Cara or husband's mind! "Detestable" Bonnie is unaffected by fantasy, but Abby's best friend and constant hang out buddy is the one swept 500 miles away.
If the foundation of the idea is negative feeling (this even goes for depressed thoughts, irritability, self-pity, blame - all that) then even unintentional musings can have a surprising "boomerang" effect.
Oh, yeah - Abby and bf break up after a year, of course, but Cara stays in Boston, having the time of her life, for over 10 years.
(I be Abby, obviously. :) I could tell you a dozen of these kinds of stories. This one is the most amusing. I won't tell the sad ones.

Heh, good, glad you broke your decision.

So here's the thing, is the "boomerang effect" a law of the universe, or a law of your-self? Just as thinking you don't deserve something can mean you don't get it, or have to 'prove yourself' when others don't - so can you having the background belief that wishing bad things means you get it back atcha be the true cause of this?

If I did such a thing - and, being ruthless and not believing anything that isn't to my own benefit - would I have got shot of "Bonnie" and kept "Cara"?

POST: I think /r/DimensionalJumping is slowly moving toward occult practice, and they have no idea

I dunno - I reckon some of them are probably aware of the overall context, see it all as part of a larger picture. Or, y'know, whatever. :-)

Q1: Just a question. I want to try this technique, but I'm worried I'll fuck up my wording(or rather what I want). In this, it's important to know that I'm a virgin and someone without a romantic partner of any sort. I guess what I'm looking for might be romance or it might just be the chance to get laid for the first time, but at the end of the day I'm struggling to figure out how I want to word things. For the latter(a focus on romance) I was gonna try "Loveless" and "Romance" but I don't know if it'd work. Any advice on wording and such(since the instructions call for one word)

The reason it's one word is to encourage you to actually summon a "handle" to the situation, rather than simply write out a description, since in the latter case you'll might just get the extended pattern of the phrase, rather than something more specific to your situation (although that can be sufficient).

So what I'd do: take a moment and ponder each situation (the current one and the target one), and pause and "ask" for the word which best captured that, and let it come to you. Sit with it a "feel out" whether it feels right. That's the word to use, since it arises from and is an aspect of that state or pattern.

Q1: Thanks dude.

No worries - hope it's helpful.

POST: Dreams mingling with reality

It's simplest to view these things as synchronicity - by which I simply mean, part of a larger pattern that is "across time", regardless of the "3D moment" you are presently attending to. (I recommend Kirby Surprise's take on this if you are interested).

But generally:

- The apparent division between waking and dreaming is arbitrary - they are both just experiences you are having, sensory experiences arising in your "mind-space".
- The "patterning" of your mind-space affects all your experiences, no matter what the apparent context.

How it works:

- Experiences leave traces which in-form subsequent experiences.
- Thoughts are also experiences - in-form-ation which shapes subsequent experiences.
- The patterning which results, when obvious, is called "synchronicity".

TL;DR: What you are is an "open aware mind-space in which experiences arise". The formatting of that mind-space affects all your experiences - waking, dreaming or thoughts.

POST: What would you consider this in an occult terms?

[QUOTE FROM 'POST: Are you guys for real? (/r/DimensionalJumping/)']

Yeah this sub seems insane, to be honest. To someone who believes this stuff: why? I am genuinely curious to know what could convince you that people have the ability to move between "dimensions".

[END OF QUOTE]

*Q1: Wishful thinking and a misunderstanding of visualization=>actualization.
Or just group insanity.*

It's basically detachment + intention, by way of a metaphor, surely? Like pretty much everything on this subreddit.

Q1: When I was desperate and tried to brute-force my way into another reality, I did use a similar technique. I just wonder if the metaphor they are using inhibits their progress.

Yeah, I don't think there should be any progress maybe. It's a user-friendly bit of fun for experimenting, but with a path to go a little deeper for the curious. Most people shouldn't go deeper. But - there's the mirror technique listed, plus from the sidebar link there's the Neville Goddard approach and a Patterning approach. I actually attached myself as mod there to tidy it up a bit because it was getting popular but seemed a bit... "not a good idea" as it stood.

EDIT: By "any" progress I mean they shouldn't have anything too powerful.

Q1: Eesh. That sounds like my relationship with /r/howtonotgiveafuck. I became really drained trying to teach people the difference between nihilism and detachment.

Haha, now that sounds frustrating! :-)

Well, it's been kinda interesting the discussions that come up. Some folk just totally get the ideas (the larger ideas behind it) and they're the people who will end up checking out /r/occult and /r/oneirosophy.

I actually think there's a place for a narrowly-defined, one-hit type approach that everyone can do when in a spot, without needing to commit to a full world-view. I quite like the idea that something could evolve into that.

POST: magic ways to fall asleep, hypnosis, sigils

Just completely give up on yourself.

TG Comments: /r/Psychonaut/

POST: How I believe time works

[POST]

The "Zipper" represents (you in) the present.

It binds all the possibilities to make one true reality.

It goes from bottom to top.

Adding perspective to it.

Looks like a book, doesn't it?

The book gets bigger and bigger every seconds.

It's huge.

Here's the book.

[END OF POST]

...

[...] I agree, nicely put. Thinking-about something requires that you turn it into conceptual objects and arrange them relative to one another in space. We end up with "moments" and "timelines" and "branches" and "dimensions" and so on. But those are mental diagrams of an idea called "time". If you check your actual experience, you cannot find that "time" at all, except when you think about it. In other words, it's only ever a concept. Time only exists upon reflection. Time is a conceptual pattern (an idea about change) upon which we hang other conceptual patterns (ideas about events). We create pretend objects then put them in a pretend relationship. It's still fun to play with though, and I doodle with that sort of thing all the time (ahem [The Infinite Grid of All Possible Moments]).

TriumphantGeorge Compendium - Part 28

POST: The hoax of employment

Q1: As I am going through college and struggling to do what I'm doing, I can't help this daunting feeling that I am fighting so hard just to be someone's bitch, the feeling is tantalizing.

Q2: Dude. If I've learned anything, (which I haven't) it's that I should always trust my gut. Because my gut is the only gut that's gonna look out for me. So if you have to trust a gut, better trust yours. Employment is a funny thing. You only have to do almost everything they say until the one thing you don't. And they can yell and froth until they're blue in the face, but you still don't have to do it. The only thing you might want to do, though, is find someone else to sign that cheque.

Double-up on the gut insight. Always do what your gut says. Even if you can't intellectually work out why you should be doing it. It will usually become obvious 'why' later.

Q3: Always do what your gut says.

This is NOT a universal rule! Perhaps I'm older than you, but I've made bad mistakes this way and I've seen other people make terrible mistakes this way. I've found that the only thing that really works is to get as much information as you can, then think things through. Perhaps a better rule is this: "Do all your research, think hard, and then make a decision. If this conflicts with your gut, check your results - twice!" My gut has definitely saved me from doing bad things - but I've often used facts and logic to overrule my gut and every time I've been right.

And, do you know, it does need a caveat, because I don't meant the same thing as "do what you feel you should do". The phrase is a bit snappy. I mean more in the manner of taking account and operating from your "global felt-sense of the situation". It's about reaching that overall sense of "rightness" before taking action. Is it better formulated in the negative? "Never proceed with something when you have a sense of unease; work through that feeling to reach a final, comfortable conclusion."

Something more akin to exploring this. In NLP I remember a variation of it as "checking with the environment" before making a change.

POST: Can ego death be similar to depesonalization?

I'll have a stab at this: I'd suggest that depersonalisation is like the creation of a 'detached witness', it's another type of separation. Like a "hollow ego", one step away from the existing thought-filled ego. (By "identification with the ego", I mean being centred on the experiential location of self-related thoughts.)

Ego death, or really ego disidentification is, in contrast, **an expanding of identity to all experience**. Including ego thoughts, which are now just "passing thoughts".

POST: Just a thought.

Our lives can be seen as representations or projections of events happening within our inner selves.

I like this. Both thoughts and external events come from the same 'source', our real selves. So both are symbolic. Neville Goddard has the nice phrase: *The world is yourself pushed out*. Which is another way of saying, **everything is the expression of yourself** - you experiencing yourself as content arising in the background essence of what you truly are. "I am Jack's raging bile duct", to quote a famous philosopher.

...

Yep. We're all cogs in the big machine. What place does the part have to question the whole?

Hmm, I hate the cogs metaphor. What about, "bubbles in a bubble bath"? Much more fun!

POST: Ideasthesia (alternative spelling ideaesthesia) is defined as a phenomenon in which activations of concepts (inducers) evoke perception-like experiences (concurrents). The name comes from the Greek idea and aisthesis, meaning "sensing concepts" or "sensing ideas"

Doesn't, say, the number "5" always trigger concepts and perception-like experience - a 'feeling' for all your '5-related experiences and knowledge' - it's just that it's not always as direct as experiencing a colour for most people.

...

Q1: Oh hey. I'm currently a cognitive psychology PhD student. We just finished up a section on conceptual processing earlier this morning in my class. There are actually two big debates in the literature concerning the way concepts are represented in the brain. Concepts may be amodal, meaning you can represent a concept independent of the modalities (vision, audition etc.); or they could be transmodal/embodyed, meaning that aspects of concepts are processed in their respective modalities and are then integrated to form a representation. For example, the appearance of a car may be processed in visual areas, while the sound in auditory areas etc. What is interesting is that there is evidence that even very abstract concepts like "justice" or "freedom" are rooted in emotional areas of the brain. So while not strictly ideasthesia, there is a huge research program concerning the relation between concepts and perception. EDIT: Top part got cut off

Experimenting with myself, I find that my concepts might have sounds, images, sensations associated with them, but there is also a 'global felt sense' too. Basically, my whole body space has a 'feel' or 'posture' that goes with a concept - felt meaning. (See Eugene Gendlin's work.)

So it seems there is more to experience than just the usual senses, in fact I'd say that the idea that they are experienced separately is wrong anyway. There is always a something more, a sense of "all the things that are connected/related to a sense". After all, objects themselves are activated concepts, there aren't any objects "out there" as such. We get a seamless experience of sensations, objects and meaning...

meaning that aspects of concepts are processed in their respective modalities and are then integrated to form a representation.

I always wonder about the use of terms such as "processed" and "integrated", as if things are computed in the brain. It seems to me more likely they are activated, like partial traces triggering a larger memory?

Q1: Well, the other thing jinxing this is how some people can "tinker" inside their heads or deliberately learn how to fool around in their own brainspace. For example, world-class memory competitors pretty much universally use a "mental mansion" technique to hack their creative brain into helping with data storage. So I tend to think that things like this may ultimately be very idiosyncratic, based largely in how a person's brain has grown and adapted over the years and how much direct control a person has over their thought processes. I suspect broad categories might be carved out, but I'd be highly surprised if it's the exact same process in every brain.

Yes, the ability to "tinker" raises interesting questions - about the simplistic approach to monitoring "brains lighting up", and also to the notion of self and control in general. Who and where is this "person" that has control over their thought processes?

The brain is also at its busiest, and most "global", when people aren't super-concentrating on anything in particular. That activity seems to be more about what's really going

on that artificial focusing experiments. It strikes me that the brain is the very epitome of a thing that cannot be chunked into "parts" that are studied separately. At least while the organ in question is still residing within the person's cranium...

Q1: *Who and where is this "person" that has control over their thought processes?*
Heh. Well, here's one thing to think about: Even if you are merely a subroutine, in what way does that actually matter if you have the potential to grant yourself superuser privileges? :-)

Haha, you're right! What do I care, if it means I get a cool bike...

...and a hot chick who can't blink? :-)

Q2: Most neuroscientists would agree with you. Few researchers still believe in a completely embodied view (see my comment above). Concepts are generally accepted to involve sensory/perception/memory areas and independent representational areas. Concerning your question on wording. The term activation is generally used to describe what we see from neuroimaging studies (keep in mind brain areas are never "off" they just become more activated). Brain area X is activated when the participant sees Y. Processing is used to describe what that brain area is actually doing with the information. So a brain area may activate for images of faces, but what it is doing is identifying the face (a process). Integration is then reserved for combining all these different types of information. Just as a note, imaging and concepts are not my primary area of research. I just happened to finish a class on it and am unfortunately writing a paper on the subject.

Thanks for that, very informative, particularly on the wording use.

POST: Money cannot buy happiness, but...

Being rich doesn't make you happy, but not-being-poor does allow more time and opportunities for doing things that make you happy. Really, what we want most is "ignorability of basic concerns" so we can get on with the stuff we care about and are passionate about.

POST: Does anyone else feel thoughts?

Yes. There's a "felt sense" which is actually the meaning of the word or thought. The image itself or the sound doesn't have that meaning. It's a global feeling instead.

Q3: It can be found in many creative situations I can think of. Conversation, dancing and sex. I think of it as a "vibe", and you feel it best by grooving with by expressing it actively and unconsciously controlled.

Nicely put!

Q4: A type of qualia <http://en.wikipedia.org/wiki/Qualia>
(Like everything?)

[QUOTE]

Qualia
Qualia is a term used in philosophy to refer to individual instances of subjective, conscious experience. The term derives from the Latin adverb quālis meaning "what sort" or "what kind". Examples of qualia are the pain of a headache, the taste of wine, or the perceived redness of an evening sky. Daniel Dennett (b. 1942), American philosopher and cognitive scientist, writes that qualia is "an unfamiliar term for something that could not be more familiar to each of us: the ways things seem to us."

[END OF QUOTE]

Thinking about it - that's basically a word that doesn't mean anything.

...

Q1: Yes.when i talk in my head ,i already know what i want to say/hear so i dont even say it and so it becomes a feeling.. Wow that doesnt make sense but yea

Q2: I wonder because I would love to categorize all those unique feelings - and then try to control them abstractly - think in a particular way to bring them about - sort of call forth their individual uses to solve problems and visualize better etc.

You can experiment with this - I've been playing with it myself. I see the feeling as the "global sense of how things are" at the moment. So, you want to talk about your day, you summon the 'feeling' of the day, and from there it is resolved into words. It's like a memory-trace from which the actions will follow, a template they get created according to. If you think about a certain topic - "tell me about, your Mother" - you have this "sense" and you can tinker with it. If you make an assertion - "I like ice cream" - you feel it's truth or not. You an then persist with it until the assertion becomes less resisted. It's like adopting a new belief or fact. Problem is, you can't really describe feelings in words, or illustrate them with pictures and sounds, so they're hard to communicate "externally".

(See Eugene Gendlin's Focusing psychotherapy for a use of the felt sense like this, and his idea of Creating From The Edge for using it to explore topics. That might help you in your categorisation thing.)

POST: Essentially, your memory is your ego?

Depends. If what you mean by "memory" is any "pattern recognition", then there would just by raw, spontaneous sensation with no "snapping-to" to any conceptual framework or objects. Complete reset to post-birth state. If you mean the more traditional "memory of things" (narrative memory) then you'd just lose the context, but not the objects.

POST: Why are you happy?

Q1: I used to answer "because I'm still alive!"
Now it is "just because".

So, are you saying you are no longer alive...?

Q1: Nope. I'm saying that I was never not alive.

And yet, whole lifetimes rise and fall within you...

POST: Why are you unhappy?

Q1: Because despite losing almost 50 pounds I still dislike my body. And a whole lot of it is I dislike it from my viewpoint, a dislike that goes away on psychedelics. I've seen myself from the third person of acid, but I wish I could view myself from the perception of someone else.

ToMetric: 50.0 lbs = 22.68 kg

I bought a new t-shirt and it cost 50 pounds...

ToMetric: 50.0 lbs = 22.68 kg

What fun.

POST: What is "it"

What is "is"?

What is what? :O

What what is, is is "is"! :-)

WHAAAT

IIIISSSSSSS

POST: [deleted by user]

Instead of trying to totally let go or resist, just be indifferent of the outcome, let resistance and letting go balance each-other out.

To me, that's what letting go would be. You don't unclench a fist by doing the opposite - forcibly opening it - you do it by stopping clenching. So letting go isn't something you do; it's a cessation of holding on. Your approach of being indifferent - non-judgemental? non-attached? - sounds like a better way to refer to it. (You can't do being indifferent!)

POST: Is it possible to be enlightened, but retain carnal desires?

Q: from a buddhist perspective? no. this is not what people like to hear, but enlightenment is an incredibly rare and difficult state to attain and takes some serious dedication to grasp, and even then it is far from guaranteed. in order to be fully enlightened you need to completely drop all attachments and desires to transcend suffering. all of these are functions of the ego that must be overcome. however, this does not mean spiritual growth is pointless. as I said, a truly enlightened person is an incredibly rare phenomenon, but working towards it now can set you up for success in your future lifetimes. dont beat yourself up over not becoming enlightened in this lifetime, just stay on the path of mindfulness and grow at your own pace.
here is some more info on steps towards enlightenment:
[http://en.wikipedia.org/wiki/Four_stages_of_enlightenment]

You make a good point, but the word "enlightenment" has become a bit of a vague word in common usage. You can directly realise the nature of your existence (maybe call that "awakening" or "seeing") but that doesn't necessarily you choose to be nonattached to the patterns that arise in experience; you might still choose to remain a "person", albeit one who's "living the dream". People who have genuinely chosen to drop it all, eradicate all accumulated memory traces, and cease accumulating new ones - as you describe - probably are very rare. Having "the answer" is all most people aspire to, I think.

...Or a mixture of the two, yes. You can "see how it is", and still choose to live your life while incorporating that. You have a new perspective - you don't have to delete your entire accumulated character. Directly experiencing the lack of boundaries alone will inform your actions from then on, for the better. Change will happen gradually by itself anyway, internal and external (being the same).

POST: [deleted by user]

Q1: Even new age became a fashion.
I noticed this and it is always going to happen. With anything. The vegetarian fad, gluten free fad, meditation fad, etc. These people are annoying because they have no real interest in said action but eventually it will actually serve them. They are essentially tricking themselves into being better healthier human beings. No matter what ideas spread as fads to the majority of the population, but you know these fads will actually stick and hopefully lay way for a better more peaceful society.

Q2: We're all victims of it. Enlightenment is the only fad that isn't a fad

I'm not even sure about that...

Q2: Well it's been talked about in books for thousands of years. Yet we're still trying to achieve it. Most of us. It's the most obvious thing in everything. It's what ties all things together, what everything has in common.

Aw, we'll get over it! ;-)

Well, it's consciousness. I suppose that's quite popular.

POST: Is there a term for what I sometimes do (sorry if this is a basic question) - explanation below.

I simply watch my brain thinking, worrying, and feeling emotions. I watch "it" thinking, worrying, and feeling emotions.

Sounds like you are stepping back from the location where most of your thoughts are - literally in the head area of your experiential space. Ego thoughts tends to be around the head area; more intuitive thoughts lower in the body and more global. If you expand your "feeling-awareness" out in into the room (open out your focus from narrow to diffuse) or shift the centre where you are "looking out from" (from your head to a more central position or lower) you can get this effect. (e.g. seeing from the core, as one example.)

The visualisation you're using is implicitly causing you to do this, I'd say. Really nice approach!

POST: Since everything is in our mind...

AI: Being at the center no matter where you are is equivalent to saying there is no center. That's not true. If you are always in the center, then you are never moving at all. The rest of reality is what moves.

AesirAnatman, you are on fire today, shootin' down the daftness. This post is your ideal home! ;-)

if everything is in our respective minds, where are our minds, then?

Every... where?

POST: What do you believe in?

Not even "best guess" - more like "current best description", maybe? That puts the emphasis on utility rather than truth. You can then apply that to everything you think too, in fact. All is provisional-for-usefulness. I agree science is the best approach for examining what I'd generalise as "the observable regularities of experience". In other words, repeatable patterns that involve objects, which can be abstracted in terms of concepts and narrative. Ultimate truth, though, is that which is the "container" for all such observations and conceptualisations - so I'd suggest that although ultimate truth can be directly experienced, it cannot be described by a model, and so falls outwith science. Like the inner surface of a sphere, if conscious, could never see its shape or true nature - it would see only the contents of itself - but it might be able to feel-know its shape directly just by being itself. (Yeah, rubbish metaphor. It was that or the "blanket of eyes" one.)

POST: Some of the many mysteries of Duality (seeking good thoughts)

You can't start from ideas about an external universe, and then work your way towards a 'through-creates-your-reality' viewpoint. We must first just admit what you know, what you don't, what you cannot.

But once consciousness comes into play it starts creating difference through the use of forms and ideals. I mean when you look at a bed the first thing you think of is what it is, a bed.

Already it is "too late": The seeing of the "bed" occurs within mind, before you even have a thought. You don't "look at a bed then have a thought" - you just have the experience of "bed" and that experience as all bed-related meanings and feelings as a part of it. Thoughts and perceptions are made of the same stuff; they differ only in their location in your field of awareness. Forgot ideas about the world, about inside and outside. Start with what you have when you wake up.

- Darkness. A sense of space. Indistinct shapes. Light.
- Within the space, sounds.
- Within the space, patterns, images... no, objects.
- A sense of "location", a meaning-feeling of being "you".
- A sense of world, perhaps an arbitrary notion of "in here" and "out there", but do you ever experience such a division really? Or do you just think-about it?

It's like a dream-world or a game. What are you really, if you strip away the content of the world? When you invite the world back in, where does it appear?

Perception and meta-thought on it are inked intrinsically on the day-to-day basis but there is a key difference, one is you and the other is happening to you.

I don't see that difference. Which is "you" and which is "happening to you"? Surely both are true of both at once?

...the barrier between things melting but that's not the normal plane we inhabit.

But why not? That sense of separation is just a habit.

Seeing is believing but feel is real too.

Surely. All experience is 'real', and in the end thoughts and perceptions are the same "thing". Thinking about a table is different to perceiving a table, but they are essentially similar except for apparent persistence. However, thinking about consciousness doesn't work that way, because it cannot be conceived of. It is not a "thing".

Thoughts warp perception and the brain is a space of consciousness. But if thinking is key for seeing, what came first. Chicken/egg ect.

Perceptions (objects) are essentially stable thoughts. Neither came first; they are part of the same ongoing process. To be clear, deliberate forced thinking is not needed for seeing. What is required is that there are established patterns in the mind to be activated.

POST: My problem with most reality theories

It is my opinion that existence does not operate in any definable manner at all, we cannot postulate on existence by taking the laws and parameters that we believe govern our subjective experience of reality and assume that the rest of existence is in any way related to those laws and parameters.

The core problem is that experience leaves traces and those traces in-form subsequent experiences. We cannot separate the structure of mind from the apparent structure of experience. Mainly because, to us, they are one and the same thing.

And finally occam's razor, the simplest explanation to me for things existing, is that they don't.

In a sense. "Exist" is difficult - perhaps better to say they don't exist in the sense that our typical world-description would assume. We can't "represent" existence, because either both the existence and the representation occur within the same field of observation, or we use the term existence to represent everything, which is meaningless.

Thanks for the reply, I'm glad you understand the difficulty and inherent problems with trying to communicate something like this.

It's difficult, but I think so long as the people having a conversation understand that it's difficult (i.e. don't get frustrated at each other because it's so obvious to them) then they can feel their way along.

existing/not existing are not singular states even if they are both definable to an extent.

Yes. So, a shadow 'exists' but it does not exist in the sense of being a separate thing to the object that casts the shadow. It would be tempting to say that the object is 'more real' than the shadow. But actually neither the object nor the shadow 'exist' without the light source which makes them both visible, so it is relative. From the perspective of the light source, the shadow and object are equally real. Yeah, wishy-washy pretty fast! :-)

For instance if you hypothetically could draw a diagram representation, how do you include your perspective of the representation within the representation...

It gets pretty folded, pretty quickly - infinite regression. Right, we have to declare one "observational level" as the foundation. I think we can do this. It's time for today's made-up metaphor! I think it's something like this:

Today's Metaphor: The Single Sheet of Paper

I have a sheet of paper. It has a line dividing it into two, and on the left side is a picture of a vivid 3D cube drawn in amazing technicolour. The right side is blank. The right side is where I can draw to think, represent. However, my drawing skills aren't that great (I can only do 2D) and my tools limited (only got red and blue crayons). But I draw the best representation that I can: a blue and red square. Okay, now I think to myself: I've represented the cube, how about I represent my representation? To do this, I don't need another level or whatever. I simply draw another blue and red square on the right side, with a little arrow pointing to the first square I drew. On the left we have "the external world". On the right we have "my thoughts about the external world" and "my thoughts about my thoughts". No infinite regress. I can have as many "thoughts about thoughts" as I like without going to a deeper level. Importantly, all of this happens on the same single sheet of paper. My aware space. My mind.

I feel compelled to mention I'm by no means as well read as a lot of people here, and what I write is pure conjecture, so there are bound to be contradictions/inconsistencies floating around

:-)

Being well-read just means you have read more. Being good at reading, being good at thinking-about-thinking is no guarantee of insight. More important to be open and curious. After all, it might be that the world we experience is inherently inconsistent. Then all those neatnik little reader-thinker folk would be screwed, wouldn't they? ;-)

...

It's starting to drive me crazy, that there are NO substantive posts with a feasible, logical, rational structure to them.

Well, lots of people are just trying and struggling to put their experiences into words - and often finding that they don't quite fit. Also, they are sometimes trying to describe something which is before logic and reasoning: That which experiences logic and reasoning (and absurdity and intuition and everything else). They are trying to describe what experiences are "made from", but you can't get outside experience in order to do this, and it's meaningless to talk of logical representations of an experience of void, say. Although I'd agree that you have to go one way or the other - half-logic is no path at all.

Experience only can come from a background of pure logic and reason underlying the very fabric of reality.

I disagree. Logic and reason aren't the base, the underlying fabric of reality. They are certainly patterns or pathways which experience may flow along - by which I mean both thought and perception - and they might even be some of the most stable pathways, but they only seem to be the foundation because they are common and become entrenched due to repeated activation. They are hard to describe in words, yes, because they are more subtle than words - words are "too late". But they at least do correspond somewhat with the structure of language, and so can be captured to some extent. Which is why they get confused with the basic level of reality - because they can be thought about and more subtle structures can't because they barely correspond to language at all. (This also means they become disproportionately reinforced by communication.)

Logical pathways might be "lowest common denominator" pathways. If every experience we have leaves a memory trace in our minds, which then funnels subsequent experience in a self-reinforcing cycle, then it would seem as if reality was built upon those pathways. They would seem to be external laws. In fact, though, this would be equivalent to simply thinking about something an awful lot ("red cars"), subsequently noticing those things after being so primed (red cars in the street), thinking about them some more ("gosh, lots of red cars"), in a passive loop. It would seem that reality was built a certain way, when in fact the 'shape of your mind' had been deformed. You could never tell the difference. In fact, there would be no difference...

It could be argued that surely only patterns that were common "out there" could lead to such stable patterns, and so patterns of mind = patterns of external reality, but there would be no way to test this. We can't point to external reality - where is it? In some parallel space beyond this room? Where is the real hand that could do the pointing anyway?

After all, when did we "wake up" and start thinking about this stuff? Who knows what patterns have been accumulated before then! If we are all one, then really there is only one mind anyway, and so there need be no fundamental solid underlying at all. Just, accumulated patterns from a random noise, eventually clustering into meaningless paths, from which our arbitrary world emerged. It seems meaningful, but only because "meaning" arose by the same process. All you have to experiment with, is the flexibility of your own experience. No maybes. ;-)

[QUOTE]

Clustering illusion

The clustering illusion is the tendency to erroneously consider the inevitable "streaks" or "clusters" arising in small samples from random distributions to be non-random. The illusion is caused by a human tendency to underpredict the amount of variability likely to appear in a small sample of random or pseudorandom data.

1,000 points randomly distributed inside a square showing apparent clusters and empty spaces

[END OF QUOTE]

There aren't 'minds' at all, we are just analogue computers which perform i/o.

I disagree that we are analogue computers. "Minds" is just a word we use to (fictionally) encapsulate a set of experiences when we talk about them.

We think about thinking, but we don't even know what a thought really is. It isn't 'anything' more than a pattern.

It isn't any-thing, that's true. And it is a pattern. But following the input-execute analogy doesn't really lead us anywhere surely. There's no evidence for it in our experience, for starters, it's just a visualisation that some people find attractive. Although your (implied) notion patterns unfolding spontaneously along "the curve" is a nice description.

There's no evidence for input-execute in our experience? What? Go read a neuroscience book, or hell, even just an informative article, you fucking hippie scum... srsly jesus christ. ew. so glad i don't reject anything that has 'weight' to it. you just write off everything because everything 'is nothing' in your view. Have fun with that crap, m8. I'd like to see the kind of moral code you've built up for yourself with that attitude... Or maybe I don't want to see it, because it's probably abhorrent.

Somebody got out of bed the wrong way? ;-)

Maybe you need to spend a bit more time reading critically and also paying attention to how you actually experience the world. Neuroscience, despite its many advances in other areas, has made very little progress when it comes to understanding how we come to perceive a "world" or the larger area of consciousness. We might be able to track brain activity from eye to brain, but we don't see "processing" of that into a "world". And it's hard to see how it ever could at present. There are currently no theories about how consciousness arises.

The signal-path/processing/construction metaphor just doesn't seem to work any better than the clockwork metaphor or the steam metaphor before it. We can't even locate memories in the brain. There's interesting stuff going on [<https://www.nytimes.com/2014/11/11/science/learning-how-little-we-know-about-the-brain.html>], but it mainly reveals how little progress we've made. But the way that minimal progress becomes turned into blanket enthusiasm and even public policy [<https://archive.nytimes.com/op-talk.blogs.nytimes.com/2014/11/24/can-brain-science-be-dangerous/?mabReward=RI%3A5>] is somewhat dubious.

That there is a link between brain and experience is certain, but the nature of that connection is... hazy to say the least. For all we can tell, we might be the equivalent of The Electric Ant [<https://sickmyduck.narod.ru/pkd077-0.html>].

Donald Hoffman's interface theory of perception is perhaps one of the more hopeful approaches (see here [<https://sites.socsci.uci.edu/~ddhoff/interface.pdf>] and more speculatively here [<https://sites.socsci.uci.edu/~ddhoff/ConsciousRealism2.pdf>], lecture here [<https://www.youtube.com/watch?v=dqDP34a-epl>] covers the issues). The problem remains that the brain as studied is itself a representation in mind, and we have a terrible habit of literally seeing our metaphors without recognising it. (Hence it being important to bear in mind that the "objects" we divide experience into aren't necessarily "out there". Wherever that is.)

Meanwhile, physicists (the late) David Bohm and Basil Hiley's work on wholeness and the implicate order is an interesting approach - see here [[Dead link](#)] for a good interview.

- **The short version:** Current models and metaphors are crap; they don't fit our experiences; we need to explore the nature of perception - and hence the apparent world - more; the future of neuroscience as an explanatory approach is just faith.
- **My moral code:** Is probably much more inclusive and considerate than someone who thinks we live in a world where "there aren't 'minds' at all" and other people are just "analogue computers which perform i/o".

Consciousness can't be described because it isn't a thing.

I would agree with that statement (although perhaps not in the way you meant it).

We think we are conscious, but what convinced you of that?

This is mistaken. It is independent of thinking. Sure, I can think, "I am conscious" but that's just a thought - but it is a thought within my awareness. By attending to the space around that thought, or the context of my experience more generally, I discover that I directly experience right now that I am aware. Or more correctly in this first-person view, that I am this awareness. I don't think this is something that can be thought about (because thoughts appear within and are made from this; consciousness is not an object). But it is a direct truth.

Why do people emphasize the fact we can perceive consciously?

Because it is their fundamental experience and any description of the world which does not account for it (or at least admit to starting from it) is incomplete. The phrasing "we perceive consciously" is problematic perhaps. Perceptions appear to us; we don't "do" perception. We must account for this also. Perception might be "ordinary" in the sense of being familiar and ever-present, but that does not mean it needs no examination. Quite the contrary. Right now you are sat in front of a screen, reading this text. If you sit back, you can feel the space in the room, become aware of all its contents. Simultaneously, you experience a sense of the place you are "looking out from". Also, any thoughts which are arising, any body sensations. Additionally, you can now think-about those these experiences. Behind all that, there is a sense of "presence". Now, you can think the words "I am just a computer, this is all programmed". But this really doesn't account for the experience at all. What I'm doing is replacing experience with a thought about it.

(And the more you take the time to examine your experience, the more you'll discover there's lots of other stuff going on. Exploring how actions and thoughts happen, how experiences snap into formations, and how adopting a certain set of ideas actually changes your actual perceptions.)

As for moral code, if we are all computers executing code, then we can never blame ourselves but rather only the situation in which code was executed. Can't be mad at people, ever, with that worldview.

If we are all "computers executing code", then we have no choice whether to blame ourselves, or be made at people, or not - or indeed anything. There is a quick cheat to all this, of course: You can insert "consciousness" as the base level material in the universe and have everything else as "patterns of consciousness".

(Christof Koch's panpsychism [<https://www.scientificamerican.com/article/is-consciousness-universal/>] does take a half step there, but not quite because he hold onto a certain notion of consciousness-and-object. Many otherwise interesting formulations [<https://www.scientificamerican.com/article/a-theory-of-consciousness/>] stumble by confusing the content of consciousness with consciousness itself. Also, confusions between consciousness, self-consciousness, awareness and attention persist.)

What makes you convinced you are 'aware'? Isn't that one of those symbols your mind made up?

You highlight an important point, you get to the essence of this.

-- It is simply directly true that awareness is my experience; it is experience itself. --

It is not symbolic.

This is different to thinking about being aware.

We could maybe say there are two types of truth:

- **Direct Truth.** I touch a pillow. The pillow is soft. It is directly true that I am having the experience of softness. Or rather, that softness is my experience. The feeling of "direct sensation". Although I am using words to describe this, I stress that this experience is not itself symbolic.
- **Conceptual Truth.** This is the truth of a coherent system of thought. A set of thoughts which fit together. That is conceptual, logical or symbolic truth. The "feeling" of an argument "making sense". Note that a conceptual framework can be entirely self-consistent, have this feeling associated with it, and yet be largely disconnected with perceptual experience, the direct facts of the world.

Both experiences occur within the same "conscious space". Being aware is the direct truth of the background sensation in which other experiences (direct perceptions and thoughts) appear. It is difficult to talk about this though, because not only is it not symbolic (it can't be experienced as Conceptual Truth), it is also not an object (so it is a Direct Truth but without a "thing" I can attach it to, unlike the pillow). Rather, it is the background which takes on the shape of those experiences, the context and the material for experiential objects. Excuse the struggle for wording there; it's the nature of the topic!

...

EDIT: Somewhat of a long reply. The dangers of typing in a 5-line-high box on a tablet. Added headings to break it up a bit. EDIT2: Just tidied up some bad formatting and phrasing after previewing.

No Mechanism: Awareness & Content

saying that awareness is the 'background' means that anything can be aware without a mechanism of awareness...

Yes. Awareness itself can be taken for granted. There is no mechanism. In fact, logically, it the only way to get things to work. The content and structure of experience is something else though. Our wormy friend isn't having the same sort of experience as us. However, his background and the nature of his experience is the same. Remember, by "awareness" I mean literally just "being aware". This is not about self-reflection or thought associations or whatever.

No Connection: Awareness & Space-Time

it's not connecting to this universal hyperfabric of awareness that permeates through everything...

There is no connection to anything. Do waves have to "connect" to the water? (Excuse me reusing a hackneyed metaphor.)

In a way, there is nothing special about this. We could ask "what is matter made from"? And hit the same problems. You might eventually answer something like "it is patterns formed by the bending of space-time". Well, maybe think of a base material whose only property is that of being-aware. That's all it does. If we "fold" that material into shapes, then we have awareness-experiencing-a-folded-shape. The more complex the shapes...

Well, this is basically the "matter/space-time" story, but with consciousness built in, inserted at the fundamental level. We get all the goodies of science, but no mind-body problem.

I guess doing drugs and thinking 'outside the box' can lead people to that conclusion, but what basis is there?

I think what happens in those experiences is that the habitual structures of mind relax somewhat, and the feeling of 'open awareness' or 'open space' becomes more apparent because it is less clouded. Like those figure/ground illustrations.

No Built-In Structure: Emergent Stability

I guess my final statement is this: why are things differential if there isn't some sort of inherent logical structure built into reality? what would have caused reality to develop the structure which allows this universal awareness that is everything/everywhere to exist?

As hinted above, we have to take "open unstructured awareness" as the starting point. This starting point is, remember, before divisions of any sort. We might use the metaphor of a blanket which then gets folded into patterns, but of course that implies a spatiality that awareness does not possess: it is not a "thing", it is formless. But things may be formed within it, but at the same time it will always remain unbroken. It has no structure; it is before structure. Therefore it is inherently everything, everywhere, always.

Taking that starting point, we can then allow the universe to come into being quite straightforwardly. Perhaps using a simple model of random fluctuations appearing, which then cluster into patterns, which self-reinforce and form more persistent structures - habits, if you will. Regularities. You could even call them "laws".

And so there comes to be a feedback mechanism: Patterns arise, leaving traces, which funnel future patterns, and so the universe tends towards stability. This applies to the universe at large, but also to our own localised experiences - and in fact those turn out to be identical.

In effect, we only need one type of metaphor to describe everything. We have:

- A "landscape" of awareness upon which the "rain" of random fluctuations falls.
- The rain erodes the landscape, leading to channels, which channels future rain.
- Before you know it, you've got a highly complex, stable world, but still with an inherent creativity and a possibility of change.

No Worries: Thoughts & Intentions

There's an additional component of intention and individual minds - by which I just mean localised areas of awareness - but even that follows the same mechanism: Thoughts would leave traces too, explaining why adopting a viewpoint appears to deform one's direct experience.

This accounts for our tendency to 'see what we believe' - repetitive thinking, or thinking while in a certain type of open mode, literally restructures our mind. (It's reasonable to ask "where is that structure?" - and it is in fact directly accessible, it's just subtle compared with the ongoing foreground experience of sounds & sights & thoughts.)

Intention might therefore be described as a "wilful deformation" of the patterns within awareness.

'localised areas of awareness' - I thought your whole point was that everything is aware... how can it be localized then?

Everything is aware, it is continuous and delocalised. Patterns, however, are not. The "sky" is everywhere, a particular "cloud" is not.

In your analogy: the landscape, the awareness untouched, it has these random fluctuations, but somehow these are separate from the landscape while also being a part of the landscape, eroding the landscape.

It's all made of the same thing. It's just a metaphor to illustrate the evolution of the world. To use words, you have to partition things up unfortunately. But it's quite hard to describe a self-fluctuating, self-memorising, self-experiencing, aware surface that has no sides or edges and is therefore not even a surface initially. ;-)

The landscape HAD topology on it already, and the 'random rain' which carves out those rivers was always going to carve out the same rivers, because of the starting topology.

Really?

In my description, all that I pre-suppose is the property of awareness + the appearance of random fluctuation. Absolutely everything else follows from that, and leads to the stable world, one with physical laws and populated with conscious beings, we find ourselves in today. You are now suggesting we start with a pre-made topology, with everything rolling down it! So, how did this topology come to be? And how did the "snowball" come to be, and arrive at its initial location?

Basically, you are saying that space-time and the laws of physics are fundamental and have always existed, right That just seems a bit... unlikely! ;-)

If you like, I'll let you call the point where the first object appears "the Big Bang" or something like that. Would that make my description more appealing to you? :-)

And yes, I am suggesting a premade topology, because in YOUR example, the rivers wouldn't form without a nook and cranny to actually erode.

You are wrong. Which is why I included that little clustering animation. Since "random" doesn't mean "evenly distributed", paths will form on such a metaphorical "memory surface". No nooks and crannies required.

Rehashing again (because you don't seem to get this point I've been making the whole damn time... like talking to a wall), things 'are', they aren't 'not'. With that in mind, it isn't a leap to say all things that 'are', are, and that's it.

Oh, but it's a massive leap and it's a cheat. It's giving up, basically. We could have done that at any point in the past. Perhaps we could have just said: Hey, here's planet Earth, it just "is". But we didn't. You are suggesting we go: Hey, here are physical laws, they just "are". Why? You can push past that. Eventually you get to "is-ness" itself. Even that doesn't need to be accepted, you can go beyond it: "is" and "is not" are not fundamental. In fact you have to go beyond this, because that's the only way to account for consciousness, and any scheme which leaves that out is incomplete. I understand your point about not being able to access beyond the "cone" - that we cannot reach out beyond the rippling-out, beyond the unfurling edge of this "pattern" - but this turns out to not be important when all patterns have the same origin.

The way your own mind works is exactly the same way the whole universe works. And of course it is! How could it be otherwise? All talk of "software" is already "too late". It's a pretty unambitious base level to set ourselves when it comes to deeper explanations. Fun at a high level, sure, and very useful, but it's not "the nature of things". The universe is not made out of code, out of inferred laws, or out of mathematics. When we observe those things, we're really just observing the structure of our own minds...

...it's that those laws of physics and space-time CAN be known... ... the preloaded mechanics of reality boils down to things that 'can' be known...

...which is basically what you say here. When we talk about conceptual schemes (laws and so on) we're not really talking about the universe "out there" at all.

POST: How do I know you exist?

Get out of your head, go outside, experience reality, and you'll see there is so much more to life than just yourself.

- Can he get out of his head?
- Where is this "outside"?
- Maybe all of life is "just" himself.
- Not little him who worries about what to have for dinner, but the larger him.
- If all these things don't exist for his amusement, what do they exist for?

I feel like there's a whole bunch of people in this thread just fucking with this poor guy at this point. He came here asking a serious question that is obviously causing him a lot of anxiety and instead of replying with the simple answer, 'Chill out. We exist too.' You all decide to fuck with him by saying 'I dunno, I might exist, I might not, nothing is real' etc.

You have a point - I don't think he was taken particularly seriously. Unfortunately intersubjectivity is the trickiest topic when it comes to consciousness and experience. It's not easy to talk straight about.

The quick answer is that everything that you experience it real-at-what-it-is. You experience others as having presence and intelligence; that is sufficient evidence. Life is definitely simpler if you just accept that and go out and enjoy it.

Right? But, if we can't let it go, if someone really wants to explore it...

Just because you have access to your thoughts and not people's thoughts (note, not "other" people) doesn't mean you are on a different level of existence. When you really pay attention you find that, reassuringly, you are not really a "person" you are aware of a person - in the same way you are aware of "other people". And that is how experience can be centred around your perspective, while avoiding being self-centred (solipsistic). You can now relax and enjoy your life from the perspective of a background awareness rather than a tensed-up human.

Are you seriously saying WE and the entire universe exist for HIS sole amusement? If true, that has got to be the most egotistical statement I've ever heard.

If he really embraced that point of view then it would be the opposite of egotistical, and it wouldn't be about amusement. If you realised that the whole world was in fact "your extended body and mind", then you'd be very kind to it. To do otherwise, to play with aspects of it non-seriously, would be like taking fire to you own arms. And it wouldn't be an egotistical notion, because such a view would annihilate the ego - there would be no places for a localised, separate sense of self, right?

TL;DR: He can know we exist because he experiences us with a corresponding intelligence. However, the deeper answer involves revisiting what he thinks he is and we are in such a way as to place himself at the centre while changing the understanding of the himself to avoid solipsism.

Solipsism

That's only a problem if we're talking about a personal mind. If he realises that he doesn't exist (as a person) either, then solipsism isn't a hurdle.

POST: Why is it that the things happening inside our brain, are instead experienced as if they are happening outside of our body?

Things don't happen inside your brain. They happen within your awareness. Your perceptions, your thoughts, all happen within your awareness. The brain and body, meanwhile, is the 3rd-person image of the the activity of localised consciousness. The image is correlated, but not causal, with experience.

I'd be interested to see the research demonstrating this.

You can do the research yourself right now! Examine your own experience, back it up with a bit of reading on metaphysics, neuroscience and consciousness, there you go! ;-)

More seriously...

Donald Hoffman - "He received his BA from UCLA in Quantitative Psychology and his Ph.D. from MIT in Computational Psychology" - gave an accessible talk on his interface theory of perception that you might find interesting though - see here [<https://www.youtube.com/watch?v=dqDP34a-epl>]. It's a bit more accessible than the published papers [<http://www.cogsci.uci.edu/%7Eddhoff/ConsciousRealism2.pdf>].

John Searle's opaque comments [<https://blog.oup.com/2015/01/perception-experience-intentionality-philosophy/>] are always interesting, but you might find the links in this post about Darkroom Vision [Darkroom Vision & Chef Hats & Dreams] worth your time.

Q: So two guys, basically. Only one of which has published any research papers. If I ask around about how credible the rest of their field considers them, what am I likely to hear? There is a saying: "Beware the man of one book". I think for the same reason it's wise to beware the man of one study, or who puts all of his confidence in a single figure because that guy agrees with him and seems sciencey/credible. The nature of truth is that it's convergent. Loads of people will arrive at it independently regardless of era or geographical distance. Has this happened yet for the idea that consciousness creates reality? Moreover, I have done some simple experiments myself as you suggested and I cannot seem to instantiate objects or alter objects in front of me by thinking about it. How do you account for this?

(Responding to the initial version of your comment.)

What, you're really going to go down the "lots of people" route on the nature of perception and consciousness? Is that how you make your decisions on other subjects?

I offered those links because they are thought-provoking and might encourage further research and reading - and experimentation. This is not an area where you can just go and read about "how it is". (In fact, I don't think there are many such areas.)

As you'll see, it's not clear what constitutes a "scientific experiment" in the field of consciousness, when there isn't actually a theory. We already have a similar problem with finding what matter "is", mind you.

Scientific Theory Side

Theorising on consciousness is the big open area. It's not just that we don't have a theory, it's that we have no idea what possible form a theory could take that will fit in with a materialist perspective - because we can't make the connection between 1st and 3rd person. Neuroscience is great stuff medically, but it keeps writing checks that it can't cash philosophically.

We often end up with "habits" (linking cosmological development to the big bang) or "promises" (it'll come out of brain research eventually, somehow) which just sit there as accepted ideas without having descriptive or predictive power. And even those that do are up for grabs - recent example [<https://phys.org/news/2015-02-big-quantum-equation-universe.html>]. This is a classic area for this. Most people just won't touch the subject, because it's a no-win in terms of your career. Still less people really care; it's something that'd be better if it went away.

But those who are more established (or retired) do have a go. Christof Koch's aricle here [<http://www.scientificamerican.com/article/is-consciousness-universal/>] is worth a read although I think it is wrong; Donald Hoffman's ideas are interesting as mentioned before; this overview article [<https://www.theguardian.com/science/2015/jan/21/-sp-why-cant-worlds-greatest-minds-solve-mystery-consciousness>] isn't great but some of the responses were interesting; Susan Greenfield has given some interesting talks but then she also comes out with other nonsense; Aeon magazine is a good resource for starting points, article examples here and here [[Deleted](#)]; Bernardo Kastrup's aggressive writing is definitely worth the thought-provokation. You might also find Erwin Schrodinger's lectures, What is Life? interesting - specfically the appendix.

But essentially - unless there's a real flip-around of some sort, we're not going to be getting a consensus anytime soon. Cristof Koch's imaginary dialogue in Scientific American sums it up. Because - in the end, all brain-as-causation theories hit the same problem - at what point does consciousness "magically" emerge from matter, if matter does not already have a consciousness aspect? (Note, I do not mean self- or reflective consciousness. Just the property of awareness.)

In fact, you can keep all the "goodies" of physics and so on if you flip it round and insert a conscious background at the ground level, within which matter/phenomena arise as structured patterns.

Experiential Reality Side

Meanwhile, you can learn a lot just by examining your actual moment-to-moment experience. You are conscious, so why not explore the nature of that consciousness from its own perspective?

Studying brain blood-flow patterns via MRI can't really offer much insight into that. Neither does reading about today's temporary theories, or thinking about experience. You actually have to do the investigation yourself to get the 1st-person insights. And only then will you know what is required of a 3rd-person theory. There's an abundance of material for this, but Rupert Spira's Presence and Greg Goode's The Direct Path are both well written and accessible. One has to ignore the "happy language" a little, but the actual approach is sound. Or you could try this little thought experiment [Outside: The Dreaming Game] (highlighted).

Other Reading

On the philosophical reading side, James M Corrigan's Introduction to Awareness is hard-going but very thorough. He tries for a ground-up description of the nature of experience. For a general round-up of the attempts to account for consciousness so far, covering both mainstream and less so, Susan Blackmore's Consciousness: An Introduction is an excellent read.

TL;DR: It ain't that simple, you're gonna have to do some work yourself, this is a "special topic" because it's not just about the sights, it's about the seeing. You need both the intellectual and the experiential aspect to make sense of it.

EDIT @ 20 mins: Re-ordered a little, added a couple of paragraphs for clarity, additional links.

(Responding to the extended version of your comment.)

Convergence & The Man of One Book

There is a saying: "Beware the man of one book".

A very wise saying! I'm totally stealing that. Similarly, beware the consensus view if you have not done the legwork yourself - or at least, be aware that you haven't. Take inspiration, I say, but keep it at arm's length.

The nature of truth is that it's convergent. Loads of people will arrive at it independently regardless of era or geographical distance. Has this happened yet for the idea that consciousness creates reality?

I don't think I ever said that "consciousness creates reality"! Reality might be made of consciousness, but that is a different thing. If "matter" was taken as the substrate layer, would we say that "matter creates reality"?

On convergence: Many people have proposed the consciousness-as-substrate view in the past. It's always been there, over the last couple of hundred years, amongst philosophers. It didn't really matter to general physics/biology until relatively recently, when the insurmountable issue of explaining consciousness via matter came to the ore. It doesn't really make much difference for "physics involving stuff", it's still more of a philosophical thing mostly. The early 20th-century physicists (back when it was more "natural philosophy") all had things to say about it, but that kind of got forgotten about. Schrodinger, Planck, Pauli, Bohr - they all had interesting views which differ from the "science=technology development" angle we ended up with by the late 20th, even if they didn't integrate them. Starting with work of the likes of David Bohm and Wholeness and the Implicate Order, his work with Basil Hiley, and culminating with an increasing number of articles by physicists on the topic in magazines like Scientific American, I think it's gradually become more prominent again. (Interestingly, it's the Bohmian approach to quantum mechanics which forms the basis for that recent article on the big bang I linked to before.)

Creation, Creator, Created

Meanwhile, we have to be very careful with the use of the word "creation" as a verb, a conscious act...

Moreover, I have done some simple experiments myself as you suggested and I cannot seem to instantiate objects or alter objects in front of me by thinking about it. How do you account for this?

...which is not to say it can't be done, eh. Those are definitely experiments everyone should try. What did you do, more specifically?

The idea that we can just sit in a chair and "think things into existence", as commonly understood, can quickly be disproven. Although we can think things into existence over-here (for that is what thoughts are) it doesn't necessarily mean we can think them into existence over-there. It is true that both thoughts and events "pattern" our minds as to the forms they will experience, though. In other words, we can be said to "create our experience", but the sense in which it is created means we'd be better to say something like "we can change the form of our experience". In the manner of, say, learning to see "trees" rather than brown patches topped off by green blobs. Or even "brown patches topped off by green blobs" rather than... nothingness. The extent to which this means "creation" rather than "formatting" depends on whether you believe there is a deeper underlying solid reality (without evidence) or that patterns of consciousness that have become stabilised is that solid reality. Even if you could establish new forms, that doesn't mean you can just fly about or make millions of dollars appear under your bed. The world might have over time established very stable habits, deeply ingrained patterns which act as an effective potential barrier to this - such as the tendency of objects to move towards one another ("gravity"), and persistence in general ("inertia"). However, within the parameters of accumulated structuring, there certainly are things we can do just by "asking" or what we might call thinking-over-there.

For instance, you can have your arm move. How do you do that?

Q: There's a lot of things I want to respond to in here, but I can't think of anything to say on the matter that won't irritate or upset you, and I don't want to do that. I do not foresee any possibility of constructive dialogue between us.

Respond!

You won't irritate or upset me, trust me. I am far less bound to a particular viewpoint than you might imagine - I'm just setting out my stall as a starting point. Be as "straightforward" as suits you, also.

...

Great, now we're up and running ;-)

This is astonishingly stupid. Only a retard would interpret this as evidence that consciousness creates reality.

I was careful to emphasise that I'm not saying that "consciousness creates reality". I'm suggesting that reality at the fundamental level is made from a material whose only property is consciousness. This isn't much different to saying it's made from "matter" - but it has the benefit that consciousness doesn't than have to magically "appear" at some point later. It's in-built. If you had followed any of the literature on consciousness studies over the last couple of decades even, you would be familiar with that approach as one of the possible solutions. If you are an appeal-to-authority kind of guy (which you seem to be) then you'll have to take the time to do some actual reading. If nothing else, read Wholeness and the Implicate Order or Paavo Pyllkanen's take on it.

Your arm moves when you want it to because a direct electrical connection exists between your brain and that limb, which conveys the signal to move.

Really? Is that what you do when you get your arm to move? Right there is missing the point and the problem. Until we can connect the experience you actually have (I bet you've never experienced "direct electrical connections in your brain" ever) and the external observations, then there is a gap that needs to be bridge. These are some of the issues at the core of the consciousness problem. You seem to not understand there is even something to explain!

"What the @#\$\$ Do We Know" is a textbook example of this, the scientists they interviewed were not told what the movie was really about.

Yeah, that was a terrible film... But the fact you even bring that up reveals something. I mean, nobody who actually is interested in these topics takes that seriously, right? Or even has a debate about it? It's like taking The Matrix as a documentary. So - I gave you a bundle of links to relevant articles by respected figures (is selected relevance "cherry picking"?) that offer the background you lack and are required to understand the problem and the potential solution, and you respond with a reference to that movie? I've referred you to no "new-age woo", as you put it. Or is it that you just automatically equate "consciousness" to a "woo topic" because it doesn't fit neatly into a conceptual framework?

Your problem is that you don't know what you don't know. You are arguing about something you have spent zero time studying. As Wolfgang Pauli would say: You're not even wrong. Finally, you seem so very... emotional about all this. Why is that? It's fine if this is an uncomfortable topic for you; simply put it aside in that case. But don't fool yourself that there's no issue, that everything's solved, that we've got this sussed at the moment, etc. Science just isn't like that, it doesn't find Truth and never aims to. In

ten years time, we might well look upon the idea of the Big Bang as a quaint mistake borne from an out-dated perspective [<https://phys.org/news/2015-02-big-quantum-equation-universe.html>].

POST: Your subconscious is smarter than you might think

I suggest that thoughts are their own things, and that **problems solve themselves**. Problems, as described in thought, are created with the intention of being solves, and so their natural tendency is to do so. Create them (formulate the problem), leave them alone, and that thought framework will come back to you in the form of the answer. It seems mystifying to us because we assume that "we" actually do things. It's actually probably more accurate to say that we set targets, and the rest of it happens to use as experiences, as the world walks the path towards those targets. It's only the tendency we have to not entirely let go to this process which results in a sense of opposition and tension - or effort - and the feeling that we do and try instead of have an experience. Meanwhile - the so-called subconscious isn't really outside consciousness, it's just not expanded as a sensory experience. It's a felt-sense that's always there. Just because it's not explicitly being encountered as "objects and sense modalities" doesn't it isn't there at all, enfolded into the background space.

Q: This is something that I have really had an interesting time dealing with, the concept that most of my decisions and actions are likely comprised of subconscious activity. I struggled with that alot after my first psychedelic experience, It was eye opening, almost like what part of reality is "real" when I'm not even consciously acting in it. How much do my eyes see in comparison to how much I truly "see." Its scary to think about. especially if you have poor subconscious patterns or tendencies.

One of my favourite topics of the moment. Perception isn't something you do, it "appears to you". To what extent do your actions just "appear to you" as well?

...

Thanks for the response.

Requesting valid citations is not an appeal to authority. Somebody's book does not equal peer reviewed research.

This really is a false point. All of those authors have academic papers about their work; their books are based on it. However, you should be well-informed enough to judge what you read on its own merits. It's not beyond anyone to understand the issues here; it does not require advanced mathematics, for instance.

But, here is a good point - One of the criticisms that has been levied at theories relating to consciousness (and indeed alternate interpretations of quantum theory, the Bohmian approach included) is that it doesn't change the results, or predict different results - it changes the description of the results. For instance, is there an experiment we could do to prove that things are made from "matter"? No, because we measure the properties of something - not what something is, or the nature of our experience of it. We just don't care about this in a physical theory. But that's exactly the gap we need to tackle in this case.

The idea that it is something separate and extricable from the brain rather than generated by it absolutely is woo.

Nobody is suggesting that, least of all me. The challenge is to have consciousness be associated with the brain without having to invoke some magical "emergence". In fact, we want consciousness to be "baked in" to reality before we even get to "brains". This is why Koch, Hoffman et al. have ended up changing tac to approach it from the other end, as it were.

And what you call studying amounts to fruitcakes reading books by fruitcakes.

Really. So, you're saying that reading the work of physicists and philosophers and other thinkers, and using them as the basis of your own thinking, constitutes "fruitcakes & fruitcakes"?

It seems to me that you are a bit of a cherry-picker yourself - the ideas you like are legitimate, those you don't, aren't.

What troubles me is that this is also what creationists say with respect to evolution. (That things aren't finalised.)

Creationists aren't pointing out that some things aren't explained, they just don't like the current explanation. The problem with consciousness is that it isn't explained with our current approach. I like that Asimov essay too, but I don't see what it adds here. I can't help but think you are reading into what I say, assuming that I am taking a position that you happen to be particularly against. What I'm saying isn't particularly controversial as a possible approach:

- Consciousness - as experienced personally and as implied by observations externally - isn't currently accounted for in our description of the world.
- Until we can bridge the gap between my 1st-person experience of being and doing, with the 3rd-person observation of my body and actions, then our description of reality, biology and consciousness is not complete.
- The faith that consciousness is "emergent" at some point in brains seems unfounded and optimistic. Where is this magical moment? At what level of complexity? Is consciousness then a "thing" that is "made", rather than a property? If it is a property, why isn't it there all along?
- When I talk of "consciousness" I am not talking about self-conscious thinking. That would depend on the complexity of a structure. I am talking about the simple property of awareness, introducing it at ground level.
- This does not lead to "consciousness creates reality" in a new-age style. It does however mean that you can move your arm (by which I mean, your whole body can move itself as a single pattern, starting with brain activity). At the moment, we cannot explain how it is possible to move your arm - we can only describe the sequence of observations that constitute arm movement.

What are the problems here?

...

Incidentally if I seem unreasonably harsh...

That's fine. It makes conversation a bit more efficient! ;-)

Wait... pause.

What exactly are we disagreeing about here? You seem to be assuming that I am suggesting that "science is not the way" and, like some sort of creationist, that some magic is responsible for our conscious experience and our world in general. In fact, I hold the opposite: That (neuro)science at the moment involves a sprinkling of magic dust at the last moment to make us conscious.

Problems??

I think neuroscience is, at the moment, super-basic and is talking up its book in the same way that genetics did back in the day (remember the certainty with which it was thought it was a "blueprint" with a gene for each property?) - most fMRI work seems to be a hack-job fishing expedition with "optimistic" statistics and an unsubtle "brain lighting up = this". This is somewhat of a funding-driven situation (I've been in similar situations in another scientific field.)

However, it will get better. I do believe the body and brain is the image of the person and their experience - "from the outside", as it were. Not in a particularly special way, in a similar sense I can tell a person's personality from their macroscopic behaviour. It's just a more detailed, granular view. So that's not the problem. Body-brain events correlate to an inner of events, quite so. To be clearer: *Body-brain events correspond to the CONTENT of my experience*

The problem is, how do I link my personal "inner" experience of content to that "outer" observation? How is it that I aware of the content? How am I able to manipulate that content (e.g. create thoughts and move my body)?

Those are the unanswered questions. No matter how detailed our description of the brain, we'll still need to tackle this, the "hard problem". Agreed?

[QUOTE]

Hard problem of consciousness

In the philosophy of mind, the "hard problem" of consciousness is to explain why and how humans (and other organisms) have qualia, phenomenal consciousness, or subjective experience. It is contrasted with the "easy problems" of explaining why and how physical systems give a human being the ability to discriminate, to integrate information, and to perform behavioural functions such as watching, listening, speaking (including generating an utterance that appears to refer to personal behaviour or belief), and so forth. The easy problems are amenable to functional explanation—that is, explanations that are mechanistic or behavioural—since each physical system can be explained purely by reference to the "structure and dynamics" that underpin the phenomenon.

[END OF QUOTE]

Solutions??

And the suggested solution (this is where you get to slag me off and say it's rubbish, but please say why that is the case):

If we incorporate "awareness" as a fundamental property of things from the start, then we just don't have the problem. Matter would not be reflectively aware but it would have "self-consciousness". Then there are no longer implicitly two separate things (consciousness and the body) with one causing the other or influencing the other. They become the same thing. Complex structures such as the brain-body will inherently experience themselves. I am my body-brain - or at least a subset of it - and I move or think simply by moving myself, as myself. (Any idea about myself being a little controller somewhere is just a thought I have from time to time. Really "I" am the whole thing.)

To change my inner experience of myself is identical to acting and thinking. We've joined together the "inner theatre" and other "outer person"!

So that takes care of that. But we also get some stuff for free: An outcome of this is we get to move away from a strictly "parts" model of the universe. With a single background "property" that is everywhere, we can have nonlocal effects explained more easily. Our view becomes an integrated, continuous one.

IIT & CR/IT & AI

It would actually be better if there was a word that wasn't "consciousness" with all the baggage it brings with it. Which is where ideas like "integrated information" (Tononi) and the "interface model/conscious realism" (Hoffman) and "active information (Bohm) come in, although they are still build on awareness-as-inherent really. I pick on those authors because they are the most complete formulations that seem hopeful at formally integrating the different parts, even though I don't fully agree with them. I am not cherry-picking - honest! ;-)

(The Tononi papers on IIT are a bit of a slog although it's worth reading the update. Scott Aaronson's blog entry on it is good though. Less sophisticated, this overview, but it adds: "Consciousness is a fundamental property of the universe. Wherever there is integrated information, there is experience.")

...

Just passing this thread again: A recent conversation reminded me that Henry Stapp - worked with Pauli and Heisenberg - is good on this. His book Mindful Universe is worthwhile, but actually the introductory chapters of Mind, Matter and Quantum Mechanics (I recently rediscovered, see here [http://www.martinshaven.com/Resources/StappMMQ.pdf]) pretty much covers it all, although a bit dense.

Stapp's interpretation of Quantum Theory is that there are many knowers. Each knower's act of knowledge (each individual increment of knowledge) results in a new state of the universe. One person's increment of knowledge changes the state of the entire universe, and, of course, it changes it for everybody else. Quantum Theory is not about the behavior of matter, but about our knowledge of such behavior.

Basically, it's a mental universe.

Anyway, that's that. Cheers!

POST: Why do humans need a sense of identity?

If we lose our identities, we lose what our humanity.

If you are something, how is it possible to lose it? I can see how we might lose our misconceptions, what we think we are - but how can you lose your true identity?

Humans are, by nature, empathetic beings.

So (I then think) if we stop interfering with ourselves, our identity, then we might be better able to relax into this more fundamental nature, and greater empathy should result?

Have you ever experienced death? Either in a medical sense, or psychedelic "ego death"?

Only in the letting-go-of-person way. Hence the ideas about a background what-you-are.

POST: What do you guys think about Eckhart Tolle?

Maybe our idea of what "walking the walk" entails is misguided. Non-duality isn't about behaviour, it's about a simple fact:

At the fundamental level, there is no separation or division, there is just the nonmaterial material whose only property is being-aware. Everything else exists only as patterns in that awareness.

As a result of this understanding, we might then conclude there are appropriate behaviours - because "we are all one" - but those are extra ideas on top. The fundamental reality itself doesn't care what patterns appear within it.

Realising the non-dual nature might result in feeling connected with all of reality and humanity "as you", but your experience is still patterned as a human experience. Just as materialists don't necessarily go about actually acting as if they were inert matter with no empathy, non-dualists don't necessarily go about being messiah-like. They are not an example to us all, "they" are just another temporary pattern in awareness.

This interpretation seems to abandon the need for any ethics.

From the fundamental viewpoint, there is no such thing. But then, from the fundamental viewpoint, there isn't anything. There is the property of connectedness of all people at the fundamental level, so we would expect an increased natural compassion for others in someone with more "insight". But with this would come a recognition that there are divisions at the human level, and that they are resolved by constant rebalancing. If everyone identified completely with the whole (the 'ethics of the continuum'), there would be no distinctions, and therefore no wars (nothing and nobody to fight) and so on. Also in effect, no people! But for as long as there are distinctions, then there is division and opposition...

And the environment - together with our human need for food and water - will create distinction and therefore opposition, even if we do not. Ethics, then, are the human "customs, habits" associated with a particular distinction (group), a particular worldview, geared towards the persistence of that distinction (group).

With this logic, it seems as if Hitler could have the same presence of mind as Tolle. Interesting indeed.

Hitler is just as much a part of "the one" as Tolle, and neither is evil from their own perspective. In fact, one extreme can only be discerned relative to the other; they are part of the ongoing rebalancing process, a destabilised object oscillation to a rest position. I would hope Tolle feels a more general compassion than Hitler did though, that his

worldview encompasses more people. However, if Tolle found himself in a cage fight, would he resort to violence?

Speaking of Tolle in a cage fight, that reminds me of the old Ghandi anecdote, which was something like: Asshole with Sword: I could kill you without blinking an eye! Ghandi: You could kill me without me blinking an eye.

Love the Ghandi quote! The more interesting cage fight would be Tolle vs Ghandi!

I think this brings up the question of "attachment" . . . only the relinquishing of attachment gets you to the real shit.

Well, this is true. You release your hold on narrowed attention, let it open out and deepen to encompass everything. You become the entire world, universe, the real deal... at which point patterns fade, you become only the continuum, and you will think it is absolutely perfect as it is. What you've learned is that to have an experience, requires a division. If you have a division, you have opposition. If you have opposition, you have conflict. The recognition of this means you no longer feel you have to fight the conflict, not that it disappears. It becomes sort of "transparent" and you can see through it. You realise that it's okay to go swimming even if the water has ripples in it, because otherwise there would be no water in which to swim. This is where "acceptance" comes in, I guess.

I wonder if it's possible to be both attached and detached at the same time? I know some meditative dudes claim to maintain "split consciousness," where they are simultaneously, say, carrying on a conversation with you and repeating a mantra in order to ground themselves.

Well, I'm not a fan of that "mantra" stuff, but I certainly think you can have multiple patterns arising in your awareness at once that don't necessarily form a continuous space. You do it all the time, in fact, by looking around you while a thought appears. The thought seems somehow to be parallel-simulataneous - occurring at the same time but no in the same "perceptual space". Normally we flip perspectives - you can do it right now: Just decide to "become" the space in the room, including the volume of space your body occupies. Now "become" your body again. And so on. From there, you can experience everything as just being "made from the background awareness". How does this then relate to our enlightened folk and their action in the world? Well, I'm not quite sure about this. If you ponder it, there is the fundamental situation (the nonmaterial material) and there is the arbitrary patterns within it. Anything at all that is not the fundamental is pattern-based, and therefore specific to the forms/habits underlying our experience. So-called "wisdom" is then relative. It's just a case of which granularity, which level of subtly, you are speaking from in terms of the patterning.

And yeah, if you identify completely with the whole, then I agree you don't exist at all.

Right. The most subtle patterns will be simple properties, then concepts, such as "relative division" and "spatial extent" and then "perimeter". These will be felt-known. Much later, there might be concepts of "image" and "sound" and "texture". We haven't even got to "object" yet...

It is all very well to say that the true reality is "love" - by which people mean the unbounded openness of being-aware - but while you are a human you have certain baseline structures in your experience that dissolving will mean, if not death, then a ceasing of this-world in perception. Recognition is good, but its primary result is probably the reduction of fear? And maybe increased possibilities...

Extra topic: Does "acceptance" mean literally accepting things as they are, even if this knowledge implies a new-found flexibility to reality which suggests we could affect it in direct ways?

...

Q: I tried reading his book "A New Earth". It started out amazing, so many of the things he was describing resonated with me. But then he got to the chapter about materialism, and the whole thing fell apart. He lost all credibility at that point, because on one hand he's talking about spirituality and consciousness and things that any human could relate to. Next he's talking about something extremely culture-centric like materialism, which applies a lot to America but not so much to some other countries (I was reading it while being in a third world asian country). It felt like he knew exactly the audience he was trying to sell the book to (namely western countries, especially the USA), so he put some chapters to appeal to that demographics specifically. It felt fundamentally dishonest, and turned me off the rest of the book, and him as a person.

What does he say about materialism what turned you off? Bringing up the subject itself isn't a problem. I would assume that to bring anyone to a new understanding you have to connect with their current worldview, and then form a bridge. Of course, if your reading requirement is that "things resonate with you" then that could be quite restrictive...

POST: I spend a lot of time reading through my own profiles, trying to figure out who I am. In reality, I should be creating who I want to be right now.

There's definitely a difference between examining the world as it is, trying to read the signs and trails to find out what's going on and what can be done, and asserting the changes you want to create a world. One assumes the world is remade and structured and you must understand the maze to make your way through it; the other says that the world is responsive and the maze adjusts to provide you with a path if you take "the bold step".

POST: Demystifying enlightenment

Try stop thinking of yourself as a human but, instead, think of yourself as a vantage point.

That's good. I think of it as a "perspective" but the actual experience is more like being an open space, with "perspective-based content" appearing within it. Like doing the "turn off your senses" exercise.

Rather simply go an sit somewhere and do nothing...

Yes, I've found this best. Or just lie down on the ground, head supported, and give up completely to gravity/God/experience or whatever. At most, you can "decide" to switch to the background perspective before you do so. Then you don't even "let go", you just no longer hold-on. Really, what you are doing is not-interfering - specifically, not-interfering with your attention, which will then release, open out, and dissolve by itself.

POST: Any older(maybe even wiser) Psychonauts here?

A great point. My favourite! Two types of truth:

- **Conceptual/Pattern Truth** - Something feels true because the conceptual framework it is a part of is self-supporting. This is the feeling of 'coherence and elegance'. However, it can be a castle in the sky; it need have no relationship whatsoever to other parts of reality to generate that feeling. These tend to be thoughts-about other experiences or patterns-about. A strategy developed on a nice map doesn't necessarily translate to a result in the field. However, it might be art.
- **Direct Truth** - The hardness of a table, the sense of being-aware, direct visual observation of an action and a result. Truths that are simply experiences, rather than thoughts-about experiences.

Obviously, the two are tangled somewhat, but it pays to be wary of enthusing about 'elegance' other than for its own sake.

POST: Not feeling the love

Do you feel "fighty against the world" generally? Lots of people do. Residual tension from past events, conflicting thoughts and concepts, etc. They will release eventually; you can do a daily "letting go" exercise to let them go a bit more efficiently (or full-blown meditation). Importantly though, don't go seeking for how you "should" feel. Feel whatever you do, then do what needs done (see David K Reynolds' Constructive Living for the chat on that). Remember, they are not "your" thoughts; they are just...

thoughts.

POST: Thoughts and plans of "suicide".

Well, haven't you got it sussed eh? Or... not. Probably missing the point, more like. Who said the purpose was 'happiness' and wilful control of your state? How come you think that the world and society is imperfect? If you think this is the case, your work is not done, despite all your "selflessness and compassion". You can't have it both ways. There is no escape. And you're not done yet. You'll be back here in no time, I think. ;-)

Q: If I do end up coming back, I'd actually like to come back as a forest :) A larger, higher, older form of consciousness. And yes forests do have a consciousness if you really think about it. Each tree communicates with one another through the release of chemicals and the help of fungi in the roots. Just like how each neuron in our brain communicates via neurotransmitters. The collective action of each organism firing off creates a larger collective consciousness.

Right - I love that image of the forest, as a "slow being". Just me and the Ents, hangin' out for the ages, having (very) long conversations.

Q: I'd actually be just as content coming back :) if it's in a different body with a different life, I'd still be content with that and am willing to accept it as a new learning experience! I'd also be just as content staying in the afterlife, where ever it may be. I actually took this online test "How old is your soul" and it said mines was millions of years old. And I know these tests can't truly measure such things, but I feel it to be very true. I feel it with all my heart. And I do believe with all my heart that the purpose is happiness and knowledge. We continue to reincarnate into this world so that our soul will build up it's library of experiences and learn all the lessons there are to learn. I feel like I've learned all I need to learn from this reality throughout all of my lifetimes and am ready to leave for good. When I spoke of willful control of my emotions. It's sorta like how regular folks will let their environment and people around them affect their emotions. They are happy when they play video games, they are sad when someone breaks up with them. Their emotions are influenced by the outside factors. For me, my emotions come from the soul. I can be wronged by others and still feel happy because the happiness comes from within, from the soul, as opposed to from the environment. "How come you think that the world and society is imperfect? If you think this is the case, your work is not done, despite all your "selflessness and compassion". You can't have it both ways."

Well, for one, I don't need to have it both ways, nor am I desiring to have it any which way. I don't know where you got that idea from to be honest. Why I think society is imperfect I've already explained within my initial post. Most of society is blinded and confused by the materialistic nature of our reality. They fill themselves with unnecessary worries from day to day when they don't need to. They let events and things in their environment affect them, stressing themselves out. They blindly follow religion and government without even giving it a second thought. Without ever questioning "why". I explained this to one of my "unawoken" friends and he told me "Well there are laws and if you break the laws, there are gonna be consequences." See, his mind is still stuck in that limited paradigm, thinking that he MUST do what society and government tells him to do, how to live, how to act, what drugs are legal/illegal, what he should and shouldn't do, etc. He's still stuck in the thinking that government IS LAW and religion IS LAW and you MUST follow them if you want to be a good person and be successful. He still thinks that success in life means finishing college, getting a well paying job, and owning a big house and a fancy car. He thinks that materialistic things will bring happiness. And he's partially right, materialistic things DO bring happiness, but it isn't true happiness. True happiness is everlasting no matter what. Materialistic happiness disappears once you take away the things that make you happy.

Yeah, I'm not sure about the 'old soul' thing... but: You're a bit clearer in this response. It's true that happiness can't come from external things, except as a brief clearing of preoccupation which allows the natural stillness to be experienced. Nothing wrong with "external fun", of course - it's just that it should be enjoyed rather than relied upon. People blindly follow because they don't realise their own power, and that we can assert our worldview rather than go looking for hints and the guide of authority. Of course, this assertion only makes sense once you've understood what you 'are'. In other words, people asking "why?" often isn't sufficient - the answers they get result in the same mistakes. I do think more people are more aware than ever before though. Not that it's any of our concern one way or the other - which is why I brought it up that you mentioned this. It's no reason to leave, in and of itself - because it basically is yourself. Anyway... True, **everlasting happiness from within** - and a nice car. Now, that's living and being. ;-)

POST: You wanna know the way out?

[POST]

“You wanna know the way out? Acceptance.”

[END OF POST]

A1: If taken seriously, this comic is idiotic. It says accept your prison, you're a rat in a maze, so just be a rat and don't try to look for an out. That's defeatism. Give up trying, give up looking. On the other hand, this comic could be very clever because after all it paints the beings who indulge in defeatism as rats, so it may be a funny and clever dig at those who preach acceptance when something more radical would have been more appropriate. If the comic is meant to be sarcastic, it's a great one.

**A2: I love this because it represents to me the major fallacies of the new-agey crowd:*

1. thinking that people want to know the way out when they are already sedated with food and entertainment
2. thinking that "Acceptance" is the 'way out' - if the TV mouse simply 'accepted' his position, he would still be stuck in the maze... Acceptance is not the full solution and IMO really only helps if you are awake enough to then realize that you can change the current reality <3*

Right. Acceptance lets you detach from the current patterns of experience. Only by detaching from them can you transform them. Acceptance allows intention to unfold - but rabid acceptance, where you hold onto the experience you are accepting, misses the point. That's... fatalism.

POST: The mind is so complicated

Thoughts...

Any pattern you discover is just... another pattern you've discovered. The more you look, the more you create-discover. Whenever you adopt a particular outlook or conceptual framework, your world will appear to fall in line with it to a greater or lesser extent: "mind-formatting by metaphor". The form of the world as experienced = the form of your mind. You experience yourself. Trying to get to 'the bottom of it' is just creating more ripples in the pool of water, obscuring what is underneath. To truly understand something is to know it directly. If you want to know the texture of something, you don't think about it - you touch it, quietly. You have to let such knowledge come to you, arise within you.

POST: Why do people want to lucid dream? This seems just like an ego trip

- A1: Because it's cool and stuff.*
- A2: Not everything is about ego vs no ego.*
- A3: What is ego?*

Lucid dreaming means first and foremost that you are aware that you are dreaming while dreaming - the direct control aspect is optional. To argue against such awareness would be to argue against, say, meditation. What you are saying is really an argument for ignorance! ;-)

The dream is "all you" anyway, whether you direct it or not. If you choose to consciously change the dream, where do you think your ideas for changes come from? What is the source of those ideas? How does that differ from the source of the spontaneous dream content?

POST: Do you think we have free will?

Yes. And you are conscious(ness). However, neither can be described or accounted for or proved conceptually, because the logic/description itself occurs within experience, as a result of the thing you are trying to reason towards.

It's a "trying to see your own eyes" type of situation.

POST: Everything you could ever possibly imagine already exists in an implicate form. When you imagine it, you're basically finding a vision of a possible future - whether you want to pursue and manifest that vision is entirely your choice.

[POST]

You can then proceed to carve out a path through space-time and you may or may not reach that point in the sea of possibilities that is the universe. I love this place. To clarify: Of course there's the obvious physically impossible visions, but you might create those visions through art or entertainment. And perhaps if we create VR so realistic we can't even tell anymore - that would mean infinite possibilities on top of the physical world. Go create your dreams in whatever way you see fit! Even if you don't reach exactly what you envisioned, that's okay, you're gonna have one hell of a ride anyway. Side-thought: this is why sci-fi is such an interesting phenomenon, people imagine a concept which seems pretty far out, which in turn inspires people/scientists, which actually steers culture and progress towards those dreams, or inspires them. Early examples: 'I imagine what it would be like to be a bird' -> boom. some dudes make a goddamn airplane. And less than 70 years later we're on the moon. After thousands of years of people being stuck on the earth. That's nuts. It's also interesting to note the similarities between biological evolution and our intelligence, if you consider memetic selection/mutation etc. So our mind is like this self-organizing expression of the universe at a higher level of consciousness, with a higher class of speed. I totally agree with McKenna's ideas on how the biosphere of the planet is like a 'slow-moving consciousness' - it has a sort of rudimentary intelligence of balancing systems out. And then you have people working towards digital intelligence, something which could lead towards the 'next level' of self-organization. We might live to see some seriously incredible stuff happen. Okay and let's go even further - once you know everything that is possible to know (...this will take a while) and you have an intelligence whose 'level' approaches infinity - you can analyze every possible permutation of the universe and try to find 'the most basic ingredient of reality'. And then you can make your own universe! Or perhaps even somehow reverse engineer ours? But I guess there's insufficient data for a meaningful discussion about that for now. Seems like I'm in a bit of a rambling mood.

[END OF POST]

How is the implicit made explicit?

Q1: That's asking how the universe came to be and how/why it unfolds. I don't know if we'll ever find a meaningful answer to that. Think of the following analogy: a chessboard has 8x8 squares and, depending on the interaction of the pieces, reaches a different configuration every time. However, within the concept of the game of chess & its rules lies the seed for every possible permutation that could come forth out of it. This is the implicit order, it is implied through the ingredients of the system. The actual unfolding of a game, the route it carves out through its 'search-space', is the explicit order. If the chess analogy doesn't really resonate, you can imagine the same analogy for the creation of images or pictures - read this [https://web.archive.org/web/20121024095654/http://barbariangroup.com/posts/1694-running_out_of_images] Now, you have humans playing chessgames and making pictures, but for reality the driving force could simply be the universe, discovering and learning itself. So my only possible answer to your question is: the implicit is made explicit because the universe is the result of energy/raw consciousness trying to understand itself.

I like the chess analogy and "search space". What I wondered about the implicit in my pondering moments was: We say that it exists, but does it exist in terms of actually being there, enfolded, or is it rather that there are a number of "possible states" within the rules, that can therefore be made explicit. Really, the latter, as a configuration space. Not that we could tell the difference. But then, what does it mean to be "explicit" anyway - just experienced in the senses? An implicit option, attended to.

The universe has been busy, it seems!

Q1: I guess the most intuitive way of putting this is that the explicit can be equated to our subjective experience, our feeling of 'now', of what the implicit order has unfolded through time.

Yes. "Unfolded" into subjective experience. With the facts-of-the-world dissolved, timelessly and spacelessly, into the background, always present and available to be focused upon ("made explicit").

Which loops round to our beginning: what is the selection mechanism by which infinity is filtered down to a particular moment vs another? I guess, via the accumulated superposition of all patterns ("the rules" and archetypes) which definite possibilities, then by our intention.

Q1: My mind is not entirely clear on that process yet. There's the whole 'deterministic/mechanistic' thing, but on the other hand there's consciousness acting as a driving force. They're both true, in a sense, it just seems to be 'intention' being modulated at a different level of complexity. That's why I said I think biological evolution and our thinking process is essentially the same thing.

I think that paths can be deterministic overall, what matters is that you have choice at the level your are at, of the deterministic paths "below" you. Which pretty much ties in with what you just said.

I think of it as "filtering patterns", with some patterns (time) more established than others (belief, expectation, knowledge) and some much more flexible (intention). When we make a decision to have an experience, we are adjusting the "intention" pattern to allow the desired experience to unfold - whether that be "I want to experience my arm raising", or something more complex, maybe not directly associated with your action.

Q1: Interesting way of formulating it! I was just pondering how string theory would suggest that the explicit universe is essentially a heavily modulated signal. Everything is just vibrations. And it happens at different scales, over different levels of complexity. So it's funny how you mention filtering, since that's what signal processing is all about :) So the universe is a self-filtering signal and an infinitely recursive fractal this is some straight up M.C. Escher stuff

Right, good comparison... and the "self" and the signal is you.

POST: What is non-duality/headlessness?

Headlessness is Douglas Harding's approach to realising the actual nature of your experience - see here. I recommend Rupert Spira for exploring non-duality.

From what I understood, we don't experience non-duality because we see life in 1st person. If we try to imagine experiencing life in the 3rd person, we see that there is not really an observer.

No, it's the other way around really.

Our direct 1st person experience is non-dual - it consists only of consciousness. That is the insight. The problems we encounter in understanding experience are precisely due to our tendency to imagine it in the 3rd person. Basically, we tend to think-about our experience rather than directly-explore it.

You might like the Imagination Room metaphor as a way of helping you play with this.

The short version:

- Your actual experience is of being a "big open aware space" in which sensations, thoughts, and perceptions appear and disappear. When we think about our experience, we tend to imagine on top of this, that we are a brain and a body and a person. But actually we don't experience those things.
- You can realise this by directing your attention at "where you are looking out from". Simply point your finger at your face, and follow the direction it is pointing in. What is there? A big open space! There is no "you" there. Your body is empty! Then you notice that this "space" extends infinitely in all directions - you cannot feel a boundary in it anywhere.

TL;DR: It's all about realising that you experience yourself as unbounded consciousness with no "outside", and all the world appears "within" that, as you.

POST: There Is Growing Evidence that Our Universe Is a Giant Hologram - Vice

Saying "it is a hologram" is so unhelpful.

If it would be phrased: the universe seems to have properties which are similar to that of a hologram - specifically, that the sum of information seems to be present and accessible locally, as well as being experienced in spatially-extended extended form. Then people might be more interested.

Although it's not very snappy, I'll admit.

POST: How do you define ego?

*Q1: I think Aldous Huxley's interpretation of it is the best.
=="Each person is at each moment capable of remembering all that has ever happened to him and of perceiving everything that is happening everywhere in the universe. The function of the brain and nervous system is to protect us from being overwhelmed and confused by this mass of largely useless and irrelevant knowledge, by shutting out most of what we should otherwise perceive or remember at any moment, and leaving only that which is likely to be practically useful. According to such a theory, each one of us is potentially Mind at Large. But in so far as we are animals, our business is at all costs to survive. To make biological survival possible, Mind at Large had to be funneled through the reducing valve of the brain and nervous system What comes out the other end is a measly trickle of the kind of consciousness which will help us to stay alive on the surface of this particular planet."

- from The Doors of Perception.==*

It's a good quote, but it reminds me of the problem I had with it at the time I read it:

If we are "Mind At Large", then in what sense are we funnelled through nervous systems and brains? Maybe we could say we "take on the experience of being" brains, take on that shape, but that's it. In other words, we are not people using brains as a filtering mechanism against Mind - we are Mind imagining ourselves to be people, with the brain a representation of our state.

Magick is then an approach by which we re-imagine our person-world. All states and experiences are always available for this process. It's a shifting of attention, therefore, rather than a transformation?

POST: Have any of you traveled to parallel universe? How? Got any tips for me?

Why are you interested?

You can't undo a reformatting. Maybe clean up first [Overwriting Yourself].

Q1: [<http://www.reddit.com/r/dimensionaljumping>] bunch of hokey if you ask me

Aw, you're no fun... ever tried it?

Q1: It seems obvious to me that the thoughts I think and the actions I execute are all the traveling to parallel universes that I need. I can see how dimensional jumping would work: you are looking into a mirror and with utmost focus you will something. Of course this changes your life! You are willing something sincerely! But to think you need to look into a mirror and that you are actually "dimension jumping" or that you don't need an actual change in your life style is silly. But hey what do I know.

To an extent you're right.

The mirror technique is a bit of a traditional hangover from scrying and whatever - a way to loosen your focus, detach, and reformat your mind (hence your experience). And "dimensions" are metaphorical in this context. Just a way to conceptualise a sudden shift. In fact, dimensions are conceptual anyway: if you examine your actual experience, you don't find any dimensions. However, it provides a way of formulating intention.

The interesting bit is that, if you play with it, it's a bit more than goal-setting and pattern-matching. The very flexible "active metaphors" being used do allow for pretty sudden shifts - extreme synchronicity, definitely, glitch-like experiences, certainly.

Like all these things, you need to experiment a little personally to really understand (or dismiss) it. There is an effect - the mechanism behind the effect, if there is a mechanism, is something to ponder though.

POST: Besides drugs and meditation, what are good ways to learn more about yourself?

A1: Try to get out of your head. The purpose of "self-exploration" isn't just to sit and navel-gaze. It does you no good to have "found yourself" if you just sit and wallow in the metaphysics of your selfhood all day. Go do something. Pursue a passion. Live.
This is a lesson I've learned first-hand after half a year of derealization following tripping and serious "self-exploration".
My suggestion? Once a week, go out, leave your phone at home, and spend the whole day exploring. Go on adventures. That plot of woods down the road? That neighborhood you don't know too well? That nature preserve a few towns away? Go check it out. Bring some friends if you want. Get lost in your own backyard.
Forget about spirituality and metaphysics and philosophy. They're empty by themselves and all too often become escapism from the fact that we're afraid to actually go do something. Put intellectual/spiritual/mental issues on the backburner for a bit and embrace that animal side of you that wants to get up and do something for it's own sake. It's bursting with vitality if you let it come out.
Forgetting about your "spiritual self" and esoteric mumbo jumbo and just being human is spirituality in itself, and at this point is more likely to put you in touch with who you really are than dropping acid or meditating or thinking about philosophy all day.
I'm not trying to put down all that stuff, as it's great. But you can go to extremes in both direction, and extremes are never healthy. I say that from experience.
Good luck.
Peace :)

Fine words.

POST: I have 43,000 youtube subscribers. I just made a controversial video on shrooms. Curious your thoughts on the video?

Video content seems mostly fair enough. The number of subscribers you have and the "controversy" shouldn't really matter, if you are sincere about what you are saying. So don't worry about that. (Unless for you it's about always getting the nice feedback, for a bit of a boost, which is fine too but a whole other thing, with its own potential problems.)

On the "controversy" -

Probably your framing of it in terms of "religious" and "atheist" stirred things up a bit, because those terms mean different things to different people, just like "God" does. Like it or not, and no matter how you caveat it, the word "God" generally means an entity god to most people, which is why something like "pure awareness" often gets used to describe that "behind the scenes unity" instead. I doubt the the "athiests" subscribed to your videos are against the idea of a "larger field" of some sort, and have possibly already found their own ways of reaching that conclusion, mushroom-free. So maybe they found your recommendation condescending. Hence dislikes.

Q1: Great comment, I really appreciate your thoughts TGeorge! :)
I actually pride myself a bit on the fact that sometimes I make videos that gets lots of dislikes. I do my best to be my true self on youtube, rather than trying to make videos that get views / likes.
So when I make a video that gets lots of dislikes, I think it's a very healthy thing.
Completely agreed with your thoughts there and I think your perfectly articulated what the real controversy is about.
In the comments I added this:
*"**I wish I used the term "spiritual" rather than "religious". My mouth didn't say the right word I guess. I can tell you from my experience, the spiritual world is real. There is something real there. Synchronicity is a real phenomenon for starters. Also, there is nothing wrong with atheism. I do not judge atheists at all. In this video I am just saying that if used responsibly and properly.. magic mushrooms are fun, and that shrooms may give you a spiritual insight or experience. :-)"*
Yeah I completely agree about how all of those terms, especially the term "God", have lots of associations to them and can mean very different things to different people.
And I clearly see how someone could think I sound condescending, which yep I believe is the source of the dislikes
Thanks for sharing your thoughts!

Yeah, to be honest, I think it can take a while to get the language right when sharing our insights - especially when they're still evolving - so the occasional stumble is inevitable, and that's okay. Personally, I try and sidestep the whole religion/spiritual atheist/god set of concepts, because those words are mostly ruined now when it comes to describing "the nature of experiencing". The downside to that is, it means you're back to explaining yourself from the ground up. On the other hand, plenty of people are starting from the other end, and at some point it hopefully joins up in the middle. :-)

POST: Bill Murray gives a surprising and meaningful answer you might not expect.

What does it mean to be "here"? To focus on your visual experience? To focus on SOUND? To focus on the air on your nose? Is being "here" meaning NOT imagining things?

I'd say it's to be aware of yourself as the background context to whatever the content of experience is. By "background" I literally mean that "open aware space" or "perceptual space" that you are, in which your sensory experiences ("the world") and shadow-sensory experiences ("your thoughts") arise.

It's okay to have thoughts and imaginings, so long as you are not narrowed on them - thoughts are just as much "now" as anything else. Conversely, being narrowed on an aspect of sensory experience such that you find yourself 'waking up' when that attention releases - for instance, being spatially concentrated in your attention while reading this message - is also being lost.

In fact, I think a problem a lot of us suffer from, is that we've conflated intending something with narrowing our attention on it - perhaps because it gives us a sense of "doing" - and over time that narrowing becomes more entrenched and the subsequent release much slower. But we don't need to do this at all.

For example, to read the text on this screen, you do not have to deliberately focus or concentrate or manipulate your attention onto it, you can actually stay open and simply intend to read it, and then let the reading "happen" - allowing attention to shift by itself, in the most appropriate way.

A similar lesson applies to physical movements: you do not need to manipulate and control your muscles "manually" in order to stand up from seated position, for example; simply intending and allowing the body to move, is sufficient. (Although if you've built up a long term habit of starting a movement by "re-asserting your current position", it may take a little while to feel out what it's like to "allow" this to happen.)

EDIT: Fixed some mobile autocorrect nonsense plus formatting.

POST: This sub doesn't feel too grounded in reality to me.

I understand in a general sense that we are all one because we are experiencing the same moment (all existence) but fail to see how this colourful language helps beyond that.

Those ideas arise from direct experiences. The same ideas come up again and again in history from various independent traditions. Sure, they are interpretations - but the core experience isn't a general sense of a lack of division or a convergence, it is a direct knowing by experience of this.

In the same way as, say, touching a table surface you know that it is a hard surface. You don't know this generally or through building a conceptual model; it is simply true.

The poetic words and meanderings are then an attempt to put into language something that can't really be put into language. Without the experience behind you, those words don't have much meaning. Just as the word "red" or - better - the word "love" wouldn't mean anything if you had never had the corresponding experiences.

Yes, you assign language meaning through experience.. language is symbolic.

Now --

-- if I have an experience that you've not had, and it's not an experience that has a corresponding visual component so you can't "see me do it" (i.e. I'm not snowboarding), does that make it less "real"?

If there is one thing we can all agree on is that there is an objective reality, Solipsism isn't what we are discussing here (and I doubt someone who genuinely believes Solipsism would budge with their opinion on the truth of it).

[QUOTE]

Solipsism:

Solipsism (i/'sɒlɪpsɪzəm/; from Latin solus, meaning "alone", and ipse, meaning "self") is the philosophical idea that only one's own mind is sure to exist. As an epistemological position, solipsism holds that knowledge of anything outside one's own mind is unsure; the external world and other minds cannot be known and might not exist outside the mind. As a metaphysical position, solipsism goes further to the conclusion that the world and other minds do not exist.

[END OF QUOTE]

No, not Solipsism but we want to be clear what we are counting as "real" and not and how the concept of "objective" is arrived at. (And it is a concept, albeit a good one which accurately describes much of our subjective experience.)

We have to admit that we infer what is objective via communication, and that there is a fuzzy area potentially. We discount certain experiences from the "shared" because we lack a way of conveying it.

What we count as "objective" becomes the lowest common denominator of subjective experience.

Yep! There is a lot of interesting aspects of life lost through language. This scene from waking life describes the problem of language in a very good way! [<https://www.youtube.com/watch?v=pvnQu30kQ2c>]

I am a big fan of that film, good reference!

Musing...

Actually, maybe that's a better angle. Rather than "oneness experience", the experience of lucid dreaming and even dreaming in colour are examples of areas which straddle the boundary between objective and subjective. They are subjective experiences but have objective acknowledgement. For a long time it was thought that people dreamed only in black and white - until they didn't. Similarly, our notions of consciousness precluded being awake in a dream, until they didn't.

Putting aside the content of lucid dreams, the fact of lucid dreams is becoming accepted - does this count as part of "objective reality"? Even though it requires practice and training to have the experience?

Of course, the content and meaning of dreams is a different issue. It doesn't help us say what a dream is. I suppose similarly, even if everyone had a "oneness" experience one night, and brain patterns correspondingly changed for the period, it would tell us that there was an experience, but not what it was.

EDIT: The problem with "oneness" is that it really doesn't have any correspondence to a physical act (e.g. in a lucid dreaming, people twitching their eyes by arrangement). It is simply knowledge. And not knowledge of events or relationships either; it makes no predictions. It suffers from the shared language problem, and the shared content problem.

I actually have had DMT many times and high dose mushrooms. The experiences have been reality and life changing but I understand it is brain chemistry being effected and don't feel the need to describe anything as mystical.

Do you understand that, or do you think-assume that? Certainly brain activation changes, but that doesn't explain the actual experience at all. For instance, if I reach an insight about my life during an experience, I cannot find that insight via fMRI, etc. I cannot find the experience in chemistry. So I think both sides - both angles of exploration and description - are valid, but they are "about" different things.

*Q: I have never heard of someone 'think-assume'ing. I am sure you just mean 'assume' on its own.
If you think you can't track/analyse an experience down to certain levels scientifically you are very unaware of the breakthroughs in science in the last 15 years.
And even if we couldn't track an experience and measure its value it has on you with certain brain chemicals released such as dopamine that still nothing to do with whether the hallucinations from drug-related or sober experiences have any truth to the nature of our reality.*

It was meant to be a "/".
Let's jump to it:

- Does anyone ever have an "objective experience"?
- How do we decide what is "objective" and what is "subjective"?
- How do we decide what is a hallucination and what is not? It's not easy.

EDIT: Just realised I've started two strands on this which kinda overlap. Let's let them both run for one more?

*Q: Broadly we need to clarify what objective and subjective mean.
A proposition is generally considered objectively true (to have objective truth) when its truth conditions are met and are "bias-free"; that is, existing without biases caused by, feelings, ideas, etc. of a sentient subject.
So basically to answer all your questions; reality is objective by definition because it is what is real, we as sentient beings experience the world subjectively. There is no such thing as an objective reality and subjective reality working separately, the subjective reality feeds from the objective reality but runs it through the animalistic filter. Both are happening at once.*

Yes, let's define!

Perhaps what you've done there is to define "the real" as:

- That which can be experienced subjectively, and
- Can be described to another and understood, and
- Seems to happen "over there" rather than "over here" (where my thoughts and feelings seem to be), and
- Has a stability or persistence to it over a reasonable timescale.

We suppose that it is fed by something we call "objective reality" (which is a concept we have), that this underlies our individual experiences, and that is why we can discuss experiences. However, all we are really establishing is that there is a commonality of descriptions which are a subset of our larger subjective experiences.

So, experiences we can shared descriptions of we call "real" and the rest not. The middle ground is that there are experience some people have had and others have not. Does this mean that their experiences are not "real"? What if having a particular experience requires training to have?

How many people need to have the experience before it is real - or are we only including over-there experiences?

What I'm getting at is, people who describe having a "oneness" experience can be describing an objective reality. We might detect the brain lighting up when someone meditates and they report that experience. How does this differ from the brain lighting up which someone is presented with visual stimulus, and later reports "seeing"

Subjective descriptive language has nothing to do with reality and truth.

Sorry to interject but - really?

It think that this is where you are going astray. Science is itself a subjective endeavour, which chooses to limit accepted findings to those that can be described in language and communicated easily between people. And it is very successful because of this. However, this means it deals with a subset of subjective experience; it does not mean it deals with an "objective" world.

Poetic language is an attempt to point to the aspects of subjective experience that cannot be easily described, and cannot be encapsulated in scientific conceptual frameworks. Typically, poetic language tries to capture the environment within which the subset of science operates. If there is a proposed fundamental truth to reality, if it cannot be subjectively directly perceived then it is simply an idea about reality, not reality itself.

Science never claims to find truth, only to connect "observed regularities" into a coherent description.

Q: I am not sure if we are talking about the same thing here. I am saying that language is merely a descriptive tool of reality. Just because we can describe something with language doesn't mean it is or has to be true... or have anything to do with reality. I can describe an amazing purple dragon in the sky above me but that has NOTHING to do with the reality that there is no dragon.

Right, perhaps we are slightly out of alignment. It's not about the dragons though. This isn't about thoughts, this is about direct experience. See if I can be clearer.

Better:

All language is surely an attempt to describe experience. All language describes a subject experience really. Science, implicitly, focussed on observed regular experiences that are seen, visual experiences. It is the most shareable aspect of experience.

Sound and texture too can be translated reasonably well into visual representations, which are then described and shared by language.

One aspect of experience that cannot be easily captured is that of feeling/sensing/direct knowing/direct intuition (we don't even have a proper word for it). Art is an attempt to render that visually. Poetic language is an attempt to invoke imagery to point towards it.

This aspect of experience is as much a part of reality as seeing, hearing, touch - all of which are actually subjective. However our inability to communicate about this particular aspect means it cannot be cleanly represented like the others.

The highlights:

- This isn't about thinking-about things.
- All experience is subjective.
- Some parts of subjective experience (seeing, hearing, touch) are more easy to create shareable representations of than others.
- Just because some aspects of subjective experience are not easy to share in this way does not mean they are not "part of reality". We call this subset "objective reality" but really we mean "easy to share via language".
- It is possible that key information about reality may come in the form of this felt-sense. Without having had the experience, other people will think the description of this as meaningless and poetic. Just as a man who has never seen colours might think descriptions of the world in terms of "vibrant red and blue" as poetic nonsense which isn't part of "reality".

POST: In your opinion, what entails being "awake", and conversely, being "asleep"?

Awakening is realising that you're not the protagonist character in the movie, you're the awareness in the cinema watching the entire drama unfold.

Or you are the screen on which the movie image is playing out. To say you're watching means you are separate. In fact you are both the experiencer and the material from which the experience is made.

This leads me to say:

- Being "asleep" means you've narrowed your attention onto the patterns of experience and are arbitrarily identifying with some of them (e.g. thoughts and body sensations, the concept or feeling thought of "me") and not others (e.g sights and sounds at a distance from body sensations).
- Being "awake" means your attention has opened out to include the context, the background space in which those patterns arise - identifying with that, with "consciousness", and realising that all patterns arise within that. In other words, "it's all you, the real you".

This is awake/asleep in the sense of direct perception, in the sense of understanding "what you really are". There's obviously political, character, and social-based awakenings that one can have too.

Depression, I'd suggest, can be a contraction of attention onto a particular pattern perhaps without knowing it - perhaps as a result of controlling and not releasing - leading to a "stuck thought" or "incomplete movement". For this, I like your analogy of getting tired of holding onto the controller. In truth, you shouldn't be holding onto the controller at all. You should be "directing from afar" by indirect request and with patience, rather than grabbing onto and forcibly pushing parts of your reality around.

POST: What is the most concise explanation of all your knowledge?

[POST]

I've had a number of profound realizations about the nature of the universe and consciousness that make it seem obvious that everything is wonderfully connected and unfolding beautifully. The problem I have though is that this requires being in a particularly high place (whether through substances or meditation) and requires being able to hold a large number of complex ideas in mind simultaneously to see how things are connected and get somewhat of a birds eye view of things. When I'm not in that state, I tend to disbelieve the realizations I had since I no longer have that perspective.

Whenever I come down from those places now I try to pack it all into a way that my normal consciousness can comprehend and believe, but I find that it's never quite enough. What is the most useful idea or ideas that you use to remind yourself of that place when you're not actually there? For example, one of the most concise things I've come across was this post on /r/DMT. I was amazed by how much it related to my own experiences in so few words . What has really summed it up for you?

THE DMT realization

- "Woah, I'm one with the universe."
- "Hold on, subjective universe/reality is a construction of my mind?"
- "Wait a second, the universe is God!"
- "I'm talking to God."
- "We are all a part of God."
- "We are God."
- "I AM GOD"

before dmt

after dmt

[END OF POST]

Good linked post.

"Imagine a multidimensional spider's web in the early morning covered with dew drops. And every dew drop contains the reflection of all the other dew drops. And, in each reflected dew drop, the reflections of all the other dew drops in that reflection. And so ad infinitum. That is the Buddhist conception of the universe in an image."
-- Alan Watts

But after the experience of being the net, you withdraw to being a dew drop again - looking out, unaware and unable to directly experience that you are still reflecting everything.

POST: Does my body and consciousness makes the complete me or their individual existence is sufficient to concur who I am?

I am changing every instant of time...

This means that what you are is neither the mind or the body? My favourite little exercise for this attached below. Whatever you really, really are, it can't be something that is changing nor can it be something you are aware of as an object. The eye can see images, but it cannot see an image of itself - only an image about itself, which is not the same thing.

The 'Switch Off Your Senses' Exercise

This little thought experiment is be done '1st person', as if you are having the experience, rather than thinking-about it:

- Sit comfortably. Now imagine turning off your senses one by one:
- Turn off vision. Are you still there?
- Turn off sound. Still there?
- Turn off bodily sensations, such as the feeling of the chair beneath you. Uh-huh?
- Turn off thoughts. Where/what are you now?
- Some people are left with a fuzzy sense of being "located". This is just a residual thought. Turn that off too.

You're still there, you realise; you are a wide-open "aware space" in which those other experiences appeared. This background awareness is the only thing that does not change over time.

POST: What is truth?

Two sorts of truth:

- Conceptual Truth: Systems of thought that are coherent, self-consistent. These "feel true" simply because their parts are true relative to the other parts. Conceptual truth may or may not correspond to reality - i.e. direct perception.
- Direct Truth: The truth of direct experience. I touch a table and discover that its surface is hard. That is directly true; it is my experience right now.

The complication: Adopting a conceptual framework actually deforms your direct experience according to its patterns. We can experience our conceptual truths (beliefs) as being directly true (as filtered). Fortunately, this "overlay" can be identified, dissolved or seen through.

Is there algorithm to the processes we use to identify Direct Truth as a species?

Well, as a personal endeavour one can shift away from thinking-about to direct-sensing. A movement from thinking to knowing. However, this cannot be communicated. The universe we experience is within ourselves. Language involves dividing that experience into "parts" and "narrative". Immediately, in the effort to communicate, we have destroyed the essence of the experience. All that can be done is to point to where that experience is to be found. It cannot be spoken, or conceptualised.

We can transfer conceptual frameworks between one another, and thereby infect others with the same "overlay" or "template" which we are using, but we cannot give someone the truly direct truth by this method. Obviously, if we throw away enough and only focus on the simplest, regular aspects of experience using the simplest concepts, we can get somewhere. For instance, if we say the world is made of up lines and corners and throw away almost everything else, then we can develop shared knowledge and even deterministic predictions of what lines and corners will do in the future.

That's universal language - eventually - but it doesn't seem like something worth shooting for other than for making, y'know, tables and chairs and stuff. (Nothing wrong with tables and chairs, or electron microscopes, but their creation isn't showing us "how things really, really work".)

truth: being in accord with fact or reality

The problem is, the facts change with the being.

...It does - except "the truth": The background awareness that you are, because that is not an object or a structure and so it cannot change. It doesn't "exist" and so it is permanent.

This is the direct truth that is always accessible, always here, because it is that from which everything else arises and fades.

POST: When do you call bullshit?

Things are useful, or not. Or fun, or not. I'll happily enjoy any way of looking at things for a while, because often it can't make your world seem more interesting and exciting - dream kicks! - and just adopting a view does have effects. Nothing is completely bullshit, but nothing is really true either. Fundamentally, the only thing you can be sure of it that you are experiencing what you are experiencing. Everything else is up for grabs. But if anyone talks of "the nature of reality" in terms of some sort of new "building block" or relationship, then that needs to be given a wide berth. The hipster-hippie crowd usually know the best coffee shops though. Sometimes that's worth enduring a crystal conversation or two, surely. ;-)

Q1: I usually test people with the chemtrails concept. If they laugh, we're good.

Oh yeah, good.

POST: Do not play life like a chess game

[POST]

Or you may find yourself missing out on the point of life.

[END OF POST]

A1: Checkmate!

Q1: :)

Q2: Well, the beauty of chess is there are so many different ways to play it! You can play aggressively or defensively. You can play your own strategy or try to foil your opponent's strategy. You can calculate 10 moves ahead, or react to each move as a new situation or opportunity. I think you're missing the point of chess.

Q3: Yes. But which strategy of chess is simply to enjoy the playing of the game?

Q4: I think what should be asked is. Are the players aware they are playing chess?

Or... is chess playing the players?

Q5: What exactly is the point of life? I mean, it's really what you make it be. Hell, I might even go as far as to say that is just a big game.

Q6: I prefer to think of it as a dream, either way, I am going to appreciate the experience.

Who is this "I"...?

And so on. I guess we can waste our time working it out, instead of living it. Chess can be played as an adventure, or a problem to be solved. It can be felt and lived, or stale and stale-mate.

POST: Is it possible to dream awake?

You can do direct-entry dreaming. I first got tipped off on this from David Fontana's Meditator's Handbook. Forget about "brain chemistry", just practice creating multi-modal imagery with your imagination. Then work on stepping into the imagery.

After that, creating alternate stable worlds is quite doable - see here [<http://www.dreamviews.com/dream-control/46571-infinite-universes-lucid-dreaming.html>].

POST: David Chalmers: How do you explain consciousness? (TED Talk)

Cross posting this comment from the /r/RationalPsychonaut thread in the "other discussions" tab, credit to /u/dalebewan:

There are essentially three 'ideas' for how to answer "What is consciousness?" presented in this video.

1. That consciousness is purely an emergent property of the action of our brains. This is actually something I've always been most comfortable with; that is to say, if we could perfectly replicate a brain, the consciousness within that brain would be identical to the original (until it diverged through different experiences).
2. That consciousness is a fundamental property of the universe, like "space", "time", and the base forces such as electromagnetism, the weak and strong nucleic forces, and gravity.
3. That consciousness is universal, in that it is in itself a description of information integration. The more something integrates information, the more conscious it is. A human brain is an excellent information integrator and thus 'very' conscious. A mouse less so, but still significant. A worm even less. A photon of light many many orders of magnitude less (but still non-zero). But nothing is without consciousness.

When watching the video and listening to these three ideas, what struck me is that it's quite reasonable to say they're all the exact same thing, just different ways of looking at it (primarily the first and the third; but the second still fits to a degree). Consciousness is an emergent property of the brain because consciousness is a universal property

that describes information integration, and the brain is an excellent information integrator.

Agreed. Somewhat, though, they are distinct because of a confusion between consciousness and self-consciousness.

Consciousness is the "material" from which the universe is made. But without any patterns within it, it cannot experience itself. Only when the blanket of consciousness has folds within it, can it be conscious of itself. Like a sheet of eyes, it cannot see itself unless it adopts a shape, contours, that one part may "see" another part.

So:

- Consciousness is the fundamental "non-material material".
- Self-consciousness is when consciousness forms itself into a pattern, so one part of the pattern can experience itself relative to another part.
- The more structure, the more "folds" there are in the patterns, the more sophisticated and subtle this experience of content and self.

Does that join the three notions together?

POST: A paradigm shift: The Primacy of Consciousness

[POST]

Amit Goswami is a quantum physicist who is challenging the scientific community with his views on the primacy of consciousness as opposed to the unflinching scientific objectivity that is the dominant paradigm. The full documentary is incredible.

[END OF POST]

Idealism!

Q: hmm, a lot of flakes pretend to be quantum physicists to get cred in spiritual or metaphysics circles, but this guy seems to be the real deal. I found this interview [https://www.youtube.com/watch?v=bnQ63AOrs6s] where he's talking about awakening. Interesting guy.

Interesting guy.

...with an interesting hat.

POST: Isn't our inability to recognize dreams from within, reason to question our beliefs of what is real?

[POST]

We all have evidence that we are inept at distinguishing dream from reality. We have all forgotten ourselves within a dream.

[END OF POST]

Yes! :-) [Outside: The Dreaming Game]

Q1: Are you suggesting that realities are interchangeable, like video games in a console? If so, why play this game? I can imagine a more enjoyable experience.

I'm suggesting, mainly, that your experience is that of being an open aware space, with content arising within it - including the dream character you call "you" - and that dreams and waking life therefore seem to be on the same level - rather than dreams being in the Russian Doll of waking life.

So, when this waking life experience fades out, another one might fade in.

Why this "game"? It seems part of the design of this game is that we don't get to remember what we were playing before, and why we chose it. I suspect that's because it makes it more exciting - to think that it's "really real". Of course, lots of us twig at some point during play that all is not as it seems. We never are in danger after all.

Q2: yes, it is. but the hard and more intersting question is, how should this realization change me and my actions?

Q3: If I suddenly found out that none of this was real I would just go sit somewhere until I "died." Refusal and all of that. I imagine if all of this wasn't real there would be some sort of being who is at a higher level. I'd basically just be saying "no" to them while hoping I persist through whatever long enough to meet them and ask "what the fuck were you thinking?"

EDIT: I should mention when I say "found out that none of this was real" I mean that I was told that it is not real. How else could you know for sure?

It is "real" - it just isn't "real" in the way you previously thought. For instance, thoughts are "real" thoughts, apparent objects are "real" apparent objects. It's just that they are only made of sensations; there's no "solid, external world" behind it. Your theory was wrong, that's all.

It is in this sense that this is a dream - and that the world around you (a dream environment) and your apparent self (a dream figure) are "dream objects", made only of "mind". You are actually the background to this experience, not the content.

Do you really only continue to live because you think this is real in some solid way? Can you not enjoy experiences for what they are, not for what you think they could be? Ever had a lucid dream? You realise you a dreaming while in a dream and now, free of fear and with the power to influence you dream more directly, you can explore it more fully...

Your comment:

I imagine if all of this wasn't real there would be some sort of being who is at a higher level. I'd basically just be saying "no" to them while hoping I persist through whatever long enough to meet them and ask "what the fuck were you thinking?"

Reminds me of this:

Actually, there's only one instant, and it's right now, and it's eternity. And it's an instant in which God is posing a question, and that question is basically, 'Do you want to, you know, be one with eternity? Do you want to be in heaven?' And we're all saying, 'No thank you. Not just yet.'

And so time is actually just this constant saying 'No' to God's invitation. I mean that's what time is. I mean, and it's no more 50 A.D. than it's two thousand and one. And there's just this one instant, and that's what we're always in."

And then she [the woman I was talking to] tells me that actually this is the narrative of everyone's life. That, you know, behind the phenomenal difference, there is but one story, and that's the story of moving from the "no" to the "yes." All of life is like, "No thank you. No thank you. No thank you." then ultimately it's, "Yes, I give in. Yes, I accept. Yes, I embrace." I mean, that's the journey. I mean, everyone gets to the "yes" in the end, right?

-- Ch. 18. Trapped in a Dream, Waking Life Movie Transcript

EDIT: Just refreshed and saw the later replies.

If the experience of life is an illusion then no one is truly experiencing anything. It may feel real, but it is not real in this case.

Isn't the problem here what you mean by "real"? It's all "real". Not truly experiencing anything? Everyone is experiencing themselves, but not as a "person". Is the universe only valid if it was created by something external to us? Is there only a "point" to life in that case?

Seems a bit arrogant to go around telling people they are wrong about subjects such as this. Perhaps "I do not agree" would be better. Or do you have proof that you are right that can be verified?

Hmm. I wasn't saying you were wrong 'in real life'. The reply was in the context of the OP saying "this is a dream" and if that was the case, then our theory that there was a solid world behind it would be wrong, and you saying that "in that case, I'd just sit about". I wasn't meaning that you were wrong.

Again, please remember this was all originally about a hypothetical situation. You're talking to me like I actually believe these things and it's confusing.

Sorry, that's just for convenience - by being in the comments, I'm assuming we're "taking the OP proposal as the starting point" and so don't need to keep caveating. Assume "in this scenario" throughout.

Curiosity is the only thing that keeps me going. I feel a need to know how it all works.

That's the tricky bit. If it is a dream-like reality, then any explanation we encounter, any evidence that it was a "solid world made of matter" would also itself just be a dream experience. There is no way out of that. There turns out to be no "how it works", just "how it appears to work when we look at it today".

So instead of curiosity being the driver (it has been for me in the past), it would have to be creativity that became the driver?

Q3: How would it be wrong? If it's a dream then someone has to wake up eventually. If that's a dream too then someone else must too. My argument wasn't for a "solid world." It was talking about the highest level of existence that is being perceived whether whoever is perceiving knows it to be or not. As far as my feelings go, I don't understand how I can make it any clearer other than saying that I will never be satisfied with existence. When awareness is dissolved I will be satisfied. That is what I consider truly being awake. That is the way out. No, I do not agree that creativity is the driver. More like the opposite, whatever that is. I do think creativity has its place though. I say curiosity because if I were to suddenly discover proof that this wasn't the "top level capable of perception" then I would not want to go on creating anything adding to our collective awareness.

I think the idea of a "top level" implies a structured hierarchy, and I don't really believe in that - it seems to follow from the notion that we wake up from dreams, that dreams are somehow like a smaller Russian Doll contained within the Russian Doll of waking life.

The experience itself isn't like that though, surely?

I don't wake up "into reality". What seems to happen is that the dream world dissolves, and then "this" world appears - in the same space. One doesn't seem to be inside the other, or higher than the other. I can be 'lucid' inside a dream without switching levels in some sense; can I not be 'lucid' inside this 'waking dream'?

When you die, it might not be "you" that switches perspective to a higher level. It might just be that "you" remain, and the world dissolves. And something else forms in its place.

So, no, as it stands now you cannot be lucid within this "waking dream" if were in fact a dream. You can only delude yourself into believing you are.

Hmm. Thought-provoking.

In a lucid dream, we might realise that we are "dreaming" because we recall "another world" that we were in before sleeping - lucid by memory. However, the nature of our experience can be different to what we assumed, and that is a different path to lucidity.

In fact, I'd suggest that when I get lucid in a dream, it's not that I remember a larger world, rather that I recall the concept of dreaming and my experience fits that concept after that realisation. And this is something we can do in waking life - realise that our experience doesn't correspond to the "solid, mechanistic" theory that we hold of it. We don't need to wake up from the dream, we can just wake up to the dream.

For you to become truly lucid within this waking life it would first need to be proved a dream with science.

Which could never happen, because science is within the dream (following this idea along). However, I can notice that things aren't how they are meant to be. This can only be done by 1st person, personal experience though.

In a lucid dream, we awaken to the fact that we aren't just the dream character we seem to be, we are the entire context of the dream. To become lucid in waking life would be to realise something of the same thing: you are not a person, you are the background environment?

advancements in mathematics and physics

The problem with simulations is that you can always just say that the simulation is such that it looks like this. It depends on whether we mean "simulation" as in 3d mechanism (content matters), or "simulation" as in, we are each presented with a VR-like experience (content is arbitrary) - like Donald Hoffman's idea of a multimodal user interface. The first is just a different version of materialism - it just means the container is different - the latter is a version of the dream/video-game idea. Any content-based proof of a dream while within a dream is made of "dream" - even an apparent memory of there being an encompassing 'waking world' - until we actually wake up from it. So proof would have to be non content-based to wake up to it.

So I'm thinking the 3d lattice idea, for instance, isn't really a restriction that tests for the condition.

I agree that any one of us can only wake up to the dream. And, yes, this would mean knowing, with proof, that we are collectively the sum of all of all our existence. The same concept would apply even if you were to call it a simulation.

Yes, it doesn't matter what we call it, it all just means "we are not living in and as an atoms-and-structure mechanistic world after all". So, meditation and altered state and non-dual experiences, can they point to this? Because I can conceive of no 3rd person 'objective' evidence that can prove it, because that's just more "experiences" and can't really point to the nature of the experiences?

Any content-based proof of a dream while within the dream still proves that it is a dream. So I fail to see an issue with it being made of that dream.

Actually, "proof" is the wrong word, strictly speaking. My error. If a dream is truly a super-flexible space that contain any experience, then I was getting at that it would be impossible to prove with 3rd-person observation. All that can be proved is that other descriptions are incorrect in their correspondence to experience...

When you mention the memory you're talking about the dream as if it itself is the sentient being.

Memory doesn't necessarily mean this. A tray of jello has a "memory", in that if you pour warm water over it, it will "remember" the path of the water and subsequent pouring will tend to flow along previous paths. However, if the jello was "consciousness" it could be said to experience the pathways, the flow.

Note: not necessarily self consciousness, as in an ability to reflect on itself. Only the ability to experience what was within it. Of course, it might label one of those jello-impressions with the word "me" - and then get confused, thinking it was that particular jello-impression, rather than the whole jello tray.

It is a projection of a sentient being. The memory exists within you. You are the source of the dream. The dream isn't the source of you. There is no need to wake up from it to realize this.

Right, but. It depends on the "you". The character/person you seem to be in the dream - the thoughts, body sensations - that "you" is generated by the dream. The dream is the source of the "you" that you seem to be in the dream. The larger "you" is the whole of the dream, it turns out once you've woken up. You could realise this during the dream, if you could find some evidence that the "small you" was not in fact the real you, and that you were in fact the whole environment and the source of that environment. Leading us to...

I do not think meditation, or altered states, can bring anyone any closer to the nature of experiences than walking down the street. To understand the nature of experience we would need to first fully understand and be able to replicate consciousness. To say that anyone is truly experiencing anything right now is delusion. It is putting faith in unverifiable experience.

I disagree.

I'd say the way to understand the nature of experience is to fully investigate your personal experience directly. When in a night-time dream, the way (one way) to realise you are dreaming and become lucid is to note a difference between the dream and wake-time experience. However, the dream content can still be completely identical to waking life experience. How would you tell the difference if you couldn't remember a "waking level"? In most dream, in fact, we don't.

Examining dream character's brains and looking through electron microscopes in a dream wouldn't tell you that you were dreaming. Scientists have dreams like that all the time, and don't - in the dream - realise they are dreaming.

Perhaps waking life is one such dream?

If there is such a hypothetical approach - to identify we are dreaming when we don't remember a larger "waking life", or let's say "alternative world-experience to get rid of the layers metaphor - we could then apply that to this "waking level" to test, from a personal perspective, whether this daily life was dream-like in the same way. Again, the content of the dream is unreliable, it can only tell us that our in-dream theories are wrong as they apply to dream content. Examination of the content cannot tell us whether we are in a dream or not.

When I say "you" I don't mean who you see yourself as in everyday waking life. I mean whatever makes you fundamentally you, separate from everyone else.

Yeah, that's what the quotes are for, to emphasise that it's a constructed idea, a particular meaning rather than the general meaning, drawing attention to it.

A tray of jello does not have memories.

Jello has about as much memory as neurons, in the example. Y'know, it's a metaphor.

When I say "you" I don't mean who you see yourself as in everyday waking life. I mean whatever makes you fundamentally you, separate from everyone else. The dream does not create this. The dream can never create this.

And, what is it that makes you fundamentally you? If you don't know what that is, you can't comment on whether a dream can create it or not. If this is a dream, then it can obviously create everything you are experiencing.

Which scientist with electron microscopes have you been talking to? Working to figure out physics in a dream would be immensely harder due to the constantly changing environment.

I think we can agree that sleeping dreams are more flexible than waking life. It's not true that they can't be stable though: non-lucid dreams are usually more stable than lucid ones, and the variable nature of lucid dreams is down to the flaky expectations of the dreams; it's easy to have stable lucid dreams if you mentally commit to it.

And I'm pretty committed to waking life.

Are you saying if we discovered a philosophical zombie you would not begin to suspect that this is a dream?

You wouldn't know it was a philosophic zombie; you'd just think the person was a bit "strange". We meet people like that all the time. Perhaps they are p-zombies.

Examination of the content could tell us it's a dream if we collectively do in fact have a waking life we cannot remember now. It would just be a matter of locating the right information. So looking at the content for this purpose is not entirely useless.

What would the right information be?

See, I'm still not seeing how you plan to establish that this is or isn't a dream. We've put aside the ability to remember another waking life that's "higher up". So it's down to the content. Stability doesn't cut it, because some dreams are more stable than others; some are rock-solid. Any content we encounter in the dream is made of dream-stuff, it's self-referencing and so can't tell us about the nature of the background to the experience.

POST: pineal gland story/question.

[POST]

I hope this is the right place to ask, I feel like of any other subreddit I know of, my brothers and sisters could tell me. This requires some back story. I first heard about "activating" your pineal gland threw a friend of mine, but she called it, "popping your front lobe" I've not been able to find anything on line referring to that practice. What I did find out on my own, and then afterwards some research is that you can make your pineal gland aware of its self. I've been doing this in addition to meditation on and off for a few years. Pretty much when I reach the calm state of meditation, thoughts slow down or stop, and breathing is shallow and not forced. I begin "massaging" my brains pineal gland. I use to do this by imaging my hands coming up and reaching into my skull threw my eye sockets. Then by using my thumbs to rub part of my brain. Currently after enough practice I can do it with out meditating, and with out imagining my hands going into my skull, or holding my brain. It use to always just pulse. Just this pulsing feeling up and down threw that small part of my brain, never really did anything more than that, and I never felt that I got any benefit from it; yet, I kept doing it. Last night something strange happened. Just thinking about it, typing it, and actively thinking; I can feel my brain cooling down. Like a cold chill, relaxing. Anyway, I was doing my normal thing while meditating. I begin to feel my brain more so that usual, like the pulsing of my pineal gland has begun to spread. As more and more parts of my brain began to feel this it reached just over 50% and I felt this sudden chill on my brain. I could only chill about 85%. It also felt as if I was sitting further back in my mind than I normally do. Trying to explain this, my normal perception of my mind and body with my eyes closed, compared to during this "chilled brain" I felt almost disconnected from myself, but I wasn't, just sitting further back. Afterwards I wanted to stop, I was unsure of this new territory and had already been at it for a while. My brain, with in 30 seconds had warmed up past a normal temperature and felt like I had a nice warm brain glow.... after about 5 minutes I felt normal. No drugs were involved, and I'd like to find out more about what happened. Is this transcending into a higher state? Over activating my pineal gland to a dangerous level? Thank you for your time.

[END OF POST]

Like seeing from the core [<http://www.reptilianagenda.com/brain/br121804d.shtml>]? (Ignore the nature of the website, the article itself is from a conference and it's the only copy I could find with free access.)

Q: Thanks. I'll give it a read, about to go into work so I'll get back to you. Thanks again!!
Edit. I have enough time to read and reply before I have to clock in. I was laying in a dark room with my eyes closed so I can't recall my vision improving. I do however have pretty good eye sight. 20/13 when I was in high school and has been better than 20/20 during my yearly eye exams for work. I'll see what I can do with this new information.

From my experience, it's something more than just "things being in focus", say. It's also somehow about being "home and relaxed" and the seeing being effortless - just there and laid out before you. "Vision and awareness" rather than eye-sight?

Shifting your centre of attention - where you "look out from"; don't actually concentrate your attention there, keep it open - to different regions of your head and body (behind forehead, central line, lower base of skull, jaw, central chest, lower abdomen) gives experience quite a different "quality" I find. Be interested to hear what you get from playing with it.

POST: I know it has been said for a long time, but I'm really starting to notice that a trend towards society waking up

[POST]

If you look at the front page of reddit right now there are advancements in science that are for the benefit of the Earth as opposed to big business. Fewer than 18% of Americans smoke cigarettes. We're seeing a population that is starting to focus their attention on the injustices of world and call BS. Ferguson may not be our brightest hour as a species, but it is a sign that things are heading in the right direction. People are fed up with nonsense and MORE importantly, willing to take action for that which makes sense.

The internet is informing us at newer and faster rates than ever before, and yeah, we're using it to spread memes - but we're using it to educate ourselves too. Mainstream media is dying out. The revolution of self-governed media intake has begun. This is huge.

I really feel society is not a lost cause anymore. I think we can salvage the good bits, with the aid of technology and action, for a future that is free and peaceful. It's not something I'm taking for granted, but it's something I have the motivation and belief that it is no longer futile to work towards. I call upon you, Psychonauts, to keep being you, and doing it in as many ways as you can or want to! Our society is no longer a place where free-thinkers must hide-away in secret societies. Upload your thoughts to twitter, start blogs, tell your friends what you truly feel about the world! Together we might just wake up in a paradise...

The truth is no longer taboo. Spread it like semen. The facets of control will try to suppress us but like a teenager who sees cleavage we are unstoppable in our desire to undress truth from the restrictive bondage of censorship that has been imposed on us for far too long.

Even now I almost went to bed without posting this, out of fear it was too melodramatic, but fuck it. We vote with our voices and actions. Use this information as you will.

[END OF POST]

The truth is no longer taboo. Spread it like semen. The facets of control will try to suppress us but like a teenager who sees cleavage we are unstoppable in our desire to undress truth from the restrictive bondage of censorship that has been imposed on us for far too long.

So, who's going to set up /r/TruthFap? ;-)

Much of what you say is true, but not in terms of the history of the planet, really just this societal go-round. The free access to historical information is the big change, but societies have risen send fallen in this cycle of understanding-and-overthrow for centuries. It is rarely about transformation; it is usually about reset.

Q1: /r/TruthPorn sounds better IMO

Probably fits a bit better.

EDIT: Deleted my bad idea in the second sentence.

Q2: It is about consistency. The best analogy of it is that it is like driving a car. Just because the car couldn't always be at 60mph doesn't mean that you should stop driving the car, when you know that is only doing it again and again to always be in that state. So, it is matter of also not judging how you need to do it again and again, because even we do same things in our lives everyday. You always have to wake up from your bed, eat, take a shit, go to work, doing what you do everyday, rest, sleep, etc. Why would having a peaceful and connected society be any different? For corruption, crimes, and so-called injustice acts that cause an effect to society, they must be repeatedly done to continue to exist.

Perhaps peace gives rise to violence, justice give rise to corruption, calm gives rise to the storm. A reset gives rise to a overshoot gives rise to a reset.

POST: Are we just biological computers with unconscious on/off switches? Is it possible we are all being run by a program called FreeWill.exe?

"The Eyes are the WindowsTM to the Soul."

If you look really closely in the mirror at your eyes, you'll see a small piece of lettering: "Version 3.1". It explains a lot.

POST: My limbo

I feel like I can gain no further insights about life.

Just give up on it. You'll never have any intellectual answers that satisfy; you'll just keep creating more complex thought-structures (stories) that are circular. Take a step back. If there is "an answer" or a "how things really are", then the answer must already be here, and how things are now must be how things really are.

Q: This is what I try to do, but it never goes away

Stop trying even to make it go away; that persists it. Just let it sit there - and go about your other business.

Q: Thanks, I'll try

Haha, no don't try!

Today's Ill-Conceived Metaphor

Think of it as, say, having a loose thread on your shirt. The thing to do is, leave the thread (nagging question) alone. Occasionally you might catch sight of the thread, and be tempted to get 'pulled in' to pulling at the thread. But you know that's just going to make your shirt (concentration, focus, balance, thoughts) unravel - you've done it before, it didn't help - so you let go of that idea and carry on with your work. You leave it be.

Then one day you realise it wasn't a loose thread at all, but part of the overall pattern of your shirt. Suddenly you see it! It's so obvious, it's just there without any effort!

The more you concentrated on the thread, the less you could see the whole pattern. You squinted your eyes to focus, you bent your vision out of shape, you got in too close. The more you pulled at the thread, you disrupted the pattern, ruined it.

Only when you gave up, and got on with other things, could your senses and perspective settle, and be ready for the insight.

POST: What is your theory of everything?

Q1: Everything is. Maybe.

Q2: Is is what is. Its all is.

All is Is.

POST: Rupert Spira discusses the nature of awareness

Yeah. Recommend his books, Presence Vol I & II. You can read a sample here. Greg Goode's book The Direct Path is similar.

the felt sense of separation being much more persistent than the intellectual view

Yes, this. Oddly, was just talking to someone about this very point, try to come up with the best way to describe it.

Because the "felt sense of separation" is basically a persistent tension or a "stuck, attached thought" in your direct, ongoing experience. Thoughts about being separate or whole come and go, as does all thinking-about. Meanwhile, direct-experiencing persists and is literally how the world is for you, right now.

You can only get rid of it by it happening to collapse, by attending to it while also attending to space (what Spira's work does), or more forcefully by deliberately overwriting it with open space via intention.

But since people don't really understand that they are experiencing a "sensory-mind-dream" in the first place, this doesn't make any sense to them. Spiral is by far the best at leading to this in modern language, I reckon. Although Francis Lucille is a good read too (related).

Glad to hear about the book and mediations. I'm always on the look out for new exercises for myself and others.

Q1: Well said! I've had to discover this in a groping-in-the-dark kind of way as clarifying the view and settling the mind chatter didn't bring the liberation I had expected. I think of the body as a sort of data compression for the long-term storage of thought, and exploring that is a sort of "down and through" process instead of the "up and out" (mental transcendence) that I was hoping for. I guess that's why everyone's talking about embodiment these days.

deliberately overwriting it with open space via intention.

I'm not totally sure I understand what you mean. Got an example?

I'm always on the look out for new exercises for myself and others.

Same here. Please share anything good you come across. I'm sure you know of Douglas Harding's brilliant experiments. I happened to notice your link to Gendlin's "felt sense", and I've found his focusing really useful. Tom Stone has some good techniques in a PDF called Pure Awareness (can't link from phone), but there's a bit of cheese factor too.

Embodiment

Yes, quite so! One of my first insights came from trying to improve my eyesight: I found an article about "seeing from the core", which basically amounted to shifting the location you are centred in and "looking out from". Then I encountered someone who suggested that rather than attending to the head area (third eye or whatever), one should go as "deep down as possible" - effectively, your lower core.

Effectively, what you're after is to centre yourself in a body-space location that doesn't suffer from accumulated tension and hence is a source of ongoing thought-generation, nor leads to the accumulation of tension.

I'm not totally sure I understand what you mean. Got an example?

Lie down (constructive rest position), get relaxed. Let go completely. Now expand your "presence" (whatever you want to call that, Peter Ralston calls it feeling-awareness, which I like) to fill the volume of your body, and then beyond into the room. Now intend that to be open empty space. You will experience push-back because - like with Gendlin's Focusing - you are asserting something (empty openness) that isn't true. Stay with it. Gradually your current experience will move towards the intended experience, the goal you've set it, of open space. Essentially, you are simply accelerating the natural release/dissolving process.

Same here. Please share anything good you come across.

This one is fun (turning off your senses and recognising you are still there, couched in this instance of the subreddit's "life is a video game" premise), and the "where is your real hand?" exercise is good for pointing out you are in a dream (you can't point to your real hand, it is "outwith the experiential space"; if you say "in my head" you try to find your "real head", so in what sense do you have a real hand or a real head?).

Yes, Douglas Harding is very good. Although I will say that it can lead to the sense of being absent in the head area without it necessarily expanding to the experience of being a complete background to all experience, and he doesn't really talk in that way. Not heard of Tom Stone; will give him a look. Greg Goode's The Direct Path, um, what else...

Anything that isn't the Tony Parsons "you-can't-do-anything", repeat-the-same-words approach!

Q1: Great stuff, TriumphantGeorge! I'm not familiar with Ralston, so I look forward to checking him out. I really get the lowering, or balancing of the the centre of attention, cuz I've found the sense of being behind the eyes to be the source of a lot of unpleasant energy buildup in the head. I just got back from a week of working one-on-one with a retired Direct Path/Daoist teacher, doing all kinds of embodiment exercises and learning about the different bodies (energy, astral etc.). I'm still sorting out what seems useful at the moment. Nice to chat with you. You've clearly done a lot of exploring. Feel free to drop me a note if you come across anything inspiring. Cheers! edit: Oh, and by the way, your game analogy and diction was stellar :)

cuz I've found the sense of being behind the eyes to be the source of a lot of unpleasant energy buildup in the head.

It can be. The head is a tricky area. There is a spot about halfway back, on the vertical centre line, which feels like "home", but most people go too far back or too far forward. It's easier to go further down that line, to the chest or abdomen. Why do it the hard way? :-)

Nice to chat with you. You've clearly done a lot of exploring. Feel free to drop me a note if you come across anything inspiring. Cheers!

And you - happy exploring!

POST: I have crippling social phobia.

Meditation, mindfulness, daily relaxation, contemplate the nature of what you are?

The longer it goes on, the more "stuck inside" you can get. Anxiety becomes a feeling that you, ironically, become comforted by or afraid to let go of, without knowing it.

You need to expand your "attention/presence out" into the world again. You are probably tightly localised inside, stuck at the back of your head, with your crazy amygdala just loving it! Just a daily relaxation where you lie on the floor, let go, and imagine-feel 'expanding into the room around you' can help loosen off the hold. (Note: this will feel a bit daunting/exposing at first, but then it will feel great.)

Some ideas to explore: This guy [http://www.anxietynomore.co.uk/] has some interesting things to say on anxiety. The Alexander Technique can help you regain control of your body and mind without tension and effort. Rupert Spira's books are good at exploring awareness, as is Douglas Harding.

POST: Having a hard time understanding Alan Watts.

Maybe read one of his more general easier books like What is Zen? to get a flavour of him first. Or try Rupert Spira's Presence Vol I & II and Douglas Harding's Head Off Stress for another approach to essentially the same fundamental insight. Then you can return to the 'world-level philosophy' stuff.

Remember also that Watts saw himself as a "philosophical entertainer" as much as anything, so often he is having fun and playing with us as well as offering insight. Sometimes, over time, that can obscure rather than help.

...

Q1: Give us an example of a paragraph that you don't understand.

Q2: In the second chapter The Game of Black and White he goes on about how there is an off for every on, an up/down, space/no space, good/bad, etc, etc. I understand that. But I completely blacked out when he started talking about our future as plastic being with inorganic body parts. I couldn't see the correlation between the two clearly.

Q1: There isn't an elegant way to really explain what he's trying to say fully in this chapter, but in my interpretation, he's trying to show all the ways we try to control ourselves and nature, and how futile it is when we don't really know the consequences of our attempts to control things (GMOs as an example). He's also making the point that all this technological progress doesn't really move us anywhere, and that we're still as unhappy as ever. Watts' style is to slowly build up his points through metaphors and what-ifs so that you can more deeply see the point he is trying to make. What I wrote up there may be simpler, but it's not nearly as rich. If you don't yet see the connections, just keep going. You'll either see it soon, usually the end of a chapter, or you'll get it later on the toilet or something. :)

Watts' point is that it doesn't really bring us fundamental happiness, if it's bound up with struggle to control. Which I think is fair. I don't think he's against, say, washing machines and computers as such.

It's not clear that the everyday life is much better, though, taken as a whole. Inequality is still massive, and in many respects people have less control over their lives than in earlier times. Every skyscraper that gets built needs a slum somewhere in the world to compensate for it, and that's a situation that only gets more extreme as resources require more effort to extract. Still: Fusion?

Watts' argues that progress is guaranteed or always beneficial. Our current optimistic science view says that "things always get better", we're always pushing history on, we're always on the up. But this isn't really true. Past civilisations were probably a lot nicer to be in than ours. We are ourselves probably hitting the end of a super-cycle, with multi-bump financial collapse on the way, and our global, just-in-time supply-chain dependencies could well be our undoing.

But: The Internet.

I wouldn't fancy going back in time to before The Nice Things!

Q3: Watts' point is that it doesn't really bring us fundamental happiness, if it's bound up with struggle to control. Which I think is fair. Well, I don't want to get too in-depth about this conversation since we seem to be more in agreement than not. But, one thing: More or less, I think that alleviating basic material suffering is largely a pre-requisite for achieving the sort of "fundamental happiness" you and Watts are talking about. It may not be possible to convert suffering directly to happiness, but alleviating suffering is an excellent first step towards that conversion. Sort of like how you can't build a house without a having a foundation first. As long as a people are still having to spend their days worrying primarily about where their next meal is coming from, any sort of higher enlightenment is all-but impossible. (See also: Maslow's Hierarchy of Needs.) Once people are comfortable enough to believe they have food, shelter, and clothing for the foreseeable future, their options for personal growth and mental progress become far greater. And since those struggles for control are also based largely in day-to-day material needs, this suggests that further alleviation of such basic suffering should (hopefully) lead to fewer harmful struggles over control of those materials. ie, No one cares who "owns" a river, if everyone nearby still has access to it. Just look at how, in the last 70 years, Europe has gone from 2,000+ years of effectively nonstop warfare to being a relatively stable, prosperous, and peaceful united community. And the defacto leader (or first-among-equals) of the EU today is the country that, 70 years ago, was considered among the most evil and harmful in all of history. Now that's karmic progress! :-> (OK, that was kinda in-depth after all...)

That was an enjoyable read! We pretty much do agree.

Although I'd perhaps add that before people started living to 80 years old, they were happy enough living to 40 years old. In that sense "happiness" is context-based.

Sure, we might also say that "enlightenment" is possible in all circumstances, because it's insight-led - but certainly being well-fed and having access to infinite informational resources makes it more likely. Not being afraid of "death at any moment" surely is beneficial overall for lots of things!

The quest for control moves its target as society changes. Before, it was about making people dig holes in fields for framing, by physical intimidation. Much later, it was about having them support the interest of the powerful (such as consumerism as a strategy for managing "overproduction") by psychological manipulation. Today, it's about the use of both, because the tide of recent progress is receding again. "Human resources" are the basic energy input to high society. In each case, everyone strives to have power over their own existence, and this always requires (even if implicitly) having power over others' existence in support of that. While resources are plentiful, only the lower level really sees suffering; everyone is given a practical level of freedom. In tighter times, the ladders are drawn up, and the illusion of progress for all is shattered.

Viewing "technology" not only as material but also psychological, then we might say that "technology" and "progress" doesn't lead to happiness or not - rather, the extent to which we are free to be ourselves and determine our lives does. And that has varied wildly over time.

(Ah. Went on a bit there...)

POST: "The universe gives you what you need, not necessarily what you want". Alot of questions regarding purpose of life, universe, reason.

You infer purpose and your character from the thoughts that appear in your mind, the actions you end up doing, and the circumstances that arise in your environment.

Your purpose is what you end up doing, if left to 'unfold' without interfering with yourself.

Everything else is theorising.

POST: [serious] Do you believe that free will exists?

The point is really that your decisions should be the best decisions possible. You don't want to be free to do just anything random, you want to be free to do "the best thing". That involves having the most information, the most accurate and comprehensive information, feeding into your decisions. If you focus on the mind, you will make decisions based on theory. If you focus on the body, you will make decisions based on emotion. If you expand your awareness to "all that is", though, then your decisions will take into account everything: the universe. So really the only decision you ever need to make is to say "yes" to letting go, releasing your narrow attention, and letting the universe act through you - because that is going to be the best decision, the ideal path anyway.

From the Richard Linklater film Waking Life (transcript here [Deleted]):

Actually, there's only one instant, and it's right now, and it's eternity. And it's an instant in which God is posing a question, and that question is basically, 'Do you want to, you know, be one with eternity? Do you want to be in heaven?' And we're all saying, 'No thank you. Not just yet.' And so time is actually just this constant saying 'No' to God's invitation. I mean that's what time is. I mean, and it's no more 50 A.D. than it's two thousand and one. And there's just this one instant, and that's what we're always in.

...actually this is the narrative of everyone's life. That, you know, behind the phenomenal difference, there is but one story, and that's the story of moving from the "no" to the "yes." All of life is like, "No thank you. No thank you. No thank you." then ultimately it's, "Yes, I give in. Yes, I accept. Yes, I embrace." I mean, that's the journey. I mean, everyone gets to the "yes" in the end, right?

TL;DR: Do I have a choice?

POST: Synchronicity and the forces of change.

Q: my parents are around the same age as yours. i've talked about synchronicity a few times with my mother before, more of just how it is a peculiar phenomenon. i was in england (which to me is a pretty magical place to being with) with her a few months ago and that whole vacation was like the most synchronicity i ever experienced. every single day we would talk about a topic and then boom we'd see it referenced all over the place. it was actually pretty crazy and mystical in it's own way. i went on that trip in june and it really did me a lot of good, got me out of a slump. i live in quebec and last winter was just a long rough cold shitty winter. i was really just bummed out by the end of it. not so much depressed, but just down. but after that vacation i felt rejuvenated. my thinking was more 'psychedelic'. i could see more possibilities, i was more positive. but ya even before that my mom had said she most definitely experienced it. though i didn't really delve into discussing any deeper meaning about it with her. i'm still not totally convinced that most of the times i've experienced it that it was not just purely coincidence. funny thing is i've had the exact same thing happen while watching jeopardy too. i'd be talking with my mother and right there the topic we're discussing turns out to be in one of the questions. that is another layer of synchronicity between you and i now haha. it's definitely an interesting thing when it happens. not sure what to make of the whole thing. to me surely everything is connected, i experienced that, but i don't know if one thing makes the other happen if you know what i mean. my bad for the long drawn out post, i'm kind of just venting. but there's one more thing i'll say since it sort of falls into this topic of having a sort of 'epiphany' and trying to share it with people, and with me going on a vacation.. well, i think at this point it was two years ago, i had went on a 3 or 4 week long vacation with my best friend. we went through europe and it was just amazing. i had so much fun and i was seeing all sorts of interesting, new things. well anyway, by the end of that vacation it was like a fucking psychedelic trip! i don't know what the hell happened to me, but i have not been able to feel like that since. i honestly would say i hit the closest i have possibly come to being 'enlightened', without really using any drugs either. but as soon as i got back home and started interacting with 'normal' people again, had to go back to work, etc, it all faded! in a matter of weeks, i was back where i started. and then this past winter, i even hit new lows! what point does this have to do with your post? well, i guess i was trying to to share what i was experiencing and people would just brush it off. and eventually it got to the point that i no longer felt that way. so in a way maybe these experiences are so personal that it doesn't matter what other people think and trying to explain it actually takes the meaning out of it.

That was a good rant, got me thinking. I don't think one thing causes the other, so much as "they are aspects of the same pattern", or something like that; it's all one thing. I wonder if being with other people, in a clockwork daily life, just wipes out that sense of connectedness or wonder or whatever it is; it seems to close you back up and make you withdraw. Maybe because daily life tends not to be very stimulating, it's on repeat? The feeling of adventure and looking fades away.

POST: The thin line of self reflection

Why try to stop thoughts? They're just part of the environment. Let them be - unless it's a particularly useful one. They'll settle down by themselves, just as - say - muscular tension settles down if your stop fiddling with it. If you fight something, you imply an opponent, and a fighting-back. Better to accept the content of experience, release focus and settle perspective to the background awareness again. Good point that thoughts imply character or the structure of ego, though. But is enough that the thought appears and you recognise it; you don't need to do anything about it.

POST: If we are all God...

Not having a belief system makes it incredibly hard to set up any meaningful goals and pursue them.

This is difficult. After much messing about, and playing with 'subjective idealism' (dream-world) stuff and so on, I figured that if almost everything is arbitrary than what matters is what I am experiencing. So goals should be able the experiences you want to have, rather than things and 'achievements'. And the way to set experiences as goals is to spend regular time imagining them from a 1st person perspective, summoning the feeling of already having the experience - a la the old Neville Goddard 'adopt the feeling of the wish fulfilled approach (retro here [<http://www.prayertheartofbelieving.com/>]).

EDIT: This conversation reminds me of an experiment blogger Steve Pavlina tried, where he adopted the belief of a 'subjective dreamworld' and tried it out, with various results [<https://stevepavlina.com/blog/2010/09/hacking-reality-subjective-objectivity/>]. There was a three part Q&A in response to readers [<https://stevepavlina.com/blog/2006/05/subjective-reality-qa/>] and related articles [<https://stevepavlina.com/blog/2005/04/your-own-private-universe/>] vs lucid dreaming [<https://stevepavlina.com/blog/2007/09/subjective-reality-vs-solipsism/>].

Q1: Watts said that if you were God, you would probably eventually end up losing yourself just for the thrill of it.

Q2: I would definitely like to believe this to be true. :)

Q3: Could God create a creature capable of forgetting that it is God?

Q2: No doubt he could, the question I want to know is why.

For the adventure! Because he knows he'll wake up afterwards, and remember it's an illusion, it doesn't matter what happens in the dream. "Whew! What a ride!", he'll exclaim. And dive in again.

...

Q4: Okay. No. Stop this bullshit where you pretend that thousands of people dying of starvation, people sawing off other people's heads and the millions of other horrors that make up this existence are somehow 'perfect'. That's just bullshit. I think Bhuddist philosophy (this whole, life is suffering ergo suffering is a okay) is just as damaging as any Christan dogma ever was. The Spanish Inquisition was nasty, but this 'all is okay' clap trap explains that it doesn't even matter! It's a philosophy for the intellectually lazy, the smug and the easily satisfied and I don't believe it's okay for one second. And I'm pretty sure you wouldn't either if you were to truly experience the horror of what some people's lives actually are. The top post on this comment is a ridiculous dismissal of all that is by comparing the suffering of millions to 'god mode' on a video game. As I type this, there's the statistical likelihood that several hundred people are being raped and murdered. That's not fucking okay, and no amount of saying everything is perfect and humming a bit is going to change that. The world is not a dream. The world is not perfect. The world is inhabited by fierce and perverted monkey creatures some of whom thrive on death and mayhem and pain and there's nothing 'perfect' about that.

Is that really what Buddhism says? I had to look it up, mind:

When we encounter phenomena, and have a feeling of dislike, worry or pain, we say that there is "suffering". This should not be generalised to "all life is suffering", because there is also a lot of happiness in life! Noises are disturbing but nice melodies bring happiness. When one is sick, poor, separated from loved ones, one has suffering. But when one is healthy, wealthy, together with one's family, one is very happy. Suffering and happiness exist in all phenomena. Actually where there is happiness, there will be suffering. They are in contrast with each other. If we only say that life is suffering when things do not go according to our wish we are rather foolish. The Buddha says, "Life is suffering". What does "suffering" mean? The sutras say: "Impermanence therefore suffering". Everything is impermanent and changeable. The Buddha says that life is suffering because it is impermanent and ever-changing. For example, a healthy body cannot last forever. It will gradually become weak, old. sick and die. One who is wealthy cannot maintain one's wealth forever. Sometimes one may become poor. Power and status do not last as well, one will lose them finally. From this condition of changing and instability, although there is happiness and joy, they are not ever lasting and ultimate. When changes come, suffering arises.

Seems more like, "life involves change, nothing is permanent, the experience of change is unpleasant". **The world is a dream**, in the sense that we overlay our thoughts on top of our experience and so perceive our views rather than what is there. It is perfect in the sense that it is all in balance and working together in harmony (food chains, etc).

TriumphantGeorge Compendium - Part 29

POST: Continuity

[POST]

O this post could be so long but I'm going to make it brief. How much value do you guys place on continuity in your experience? Would you trade continuity for super powers? How about bliss? Nirvana?

[END OF POST]

Discontinuity all the way.

Wow, a discussion on a 6 day old thread nice! I agree, discontinuity allows more freedom in a way, and in a sense the continuity we experience is kind of imagined. I mean, we are never the same as we were, we just think we are. Makes me feel a little less sad about losing one of my favourite notebooks (believe it or not the same notebook from my story on glitch_in_the_matrix, which I take it you read) where I wrote down a lot of my passions and dreams. They're bound to change anyway, but still it hurts.. I want it to show up. I guess that's me wanting continuity. I'm a conflicted soul in this way.

Was browsing and the title caught my attention (I love the idea of "discontinuities"). Anyway -

- We are always the same "background", but the content changes.

Discontinuities in the content would make life far more flexible. If you don't mind things appearing/disappearing, your circumstances changing dramatically, your environment shifting - you can have everything, potentially! But you can also lose everything, potentially. If you are willing to let your world be that ephemeral, then one moment may not lead to the next. All vision might fade...

Thing is, where was that notebook when it wasn't in your hands? It was just a thought in your head (or actually, a 'background feeling/knowing'). The thing itself wasn't anywhere. You never had it in the first place, much.

But, yeah, I know what you mean. Losing things hollows out a bit of your emotional self/content, and leaves a gap. A petit mort! Time for a magickal spell, perhaps, to have it re-materialise?

EDIT: Have you thought about how you might capitalise on/create discontinuities?

Isn't the world already that ephemeral, it's just I don't perceive it to be.. yet?

Yes, it is, I would say.

The Model

My general model for this is, quickly:

- Think of yourself as the background of experience, the 'awareness' in which it arises.
- Experiences arise, and leave traces.
- Those traces then structure subsequent experiences, leaving traces, deepening patterns, creating tendencies.
- Unfolded objects > enfolded forms > unfolded objects > . . .
- Experiences then tend towards stability => objects and narrative.
- We could call these laws (apparent physical laws, cause and effect), habits (repeated actions) and beliefs (lighter patterns structuring our perception).
- But: There is no "real" underneath. Like hypnogogia before sleep, sparkles > fragments > images > objects > environments > dreams. Randomness becomes stability, unfolding both deterministically and creatively.

Anyway, with that out the way, the content of our experience is just that, it's just what we perceive and nothing more. Objects are made of "eyes and fingers", with no solid backing.

In a lucid dream, if you declare a new fact (state a new belief) and don't resist it, the experience comes to be. Content aligns with your beliefs. I think that waking life is very similar, albeit more stable and sluggish, because it has been around a lot longer than your dreams; it has solidified. But all that is preventing a complete discontinuity isn't the continuousness of content - that is illusory - it is the stability of the beliefs or 'enfolded forms' in awareness.

The Implication

If you start tinkering with your beliefs and expectations, your experiences tend to adjust. You get coincidences and synchronicities. It's as if your world tries its best to "line up" with what you've decided the facts should be. This is how "magickal traditions" all work at their root.

But the kicker: Adopting a new belief, or "inserting new facts", is easy: you simply declare the new truth. No effort required. However, you must completely let go of resistance to what happens, to the change, and to the new idea. (Fun free book by Alan Chapman which discusses similar ideas, [here](#).)

That's quite frightening. Anything could happen.

Getting extreme and unlikely: Say something happened in the past and you'd like to change it. Say you could, by simply lying down, letting go completely, and declaring it so - say you could suddenly find yourself "reset" to that time. Would you do it? If I told you (I'm not, but as an emotional experiment) that this could be done. Would you? I reckon you'd find it hard to make yourself do it. The implications for the reality of your surroundings, what "people" really are, etc, are pretty disconcerting!

An Experiment

You should try an experiment, via the Alan Chapman book maybe. Simply declare: "My book will come to me this month" or "My book is coming to me this month" - it has to be worded as a present fact - and let that become true to you. ;-)

Note: It's about the feeling of it being true, rather than imagining it in pictures or whatever. Simply the statement, and the acceptance of the feeling. It's a fun experiment. Whether it works, who can tell - - -

I've experimented a bit with discontinuities, but you have to be careful. The truths you adopt really do have an effect: So, if you start thinking poorly of yourself, for instance, then things line up very quickly to prove you right! I've seen depressive people enter massive doom-spirals because of that.

So it's important to "think positive" - but not in the cheesy, "positive thinking" way - rather, in adopting a positive, desirable vision for your life as a feeling. (A bit like old Neville Goddard's idea.)

Thank you very, very much for this reply. I feel you've given me an outline to something huge and obviously life-changing. I'm interested in what you have said, and am going to probably study this comment for quite a while. If what you are claiming is true, I want to use it for love and light and the unification of awareness with the best possible experience for it, which I currently imagine to be a really kickass story. Perhaps I am naive in thinking this way, but it is how I feel, and normally I'd say I can't change that - but I suppose according to you I can. Still, there are facets of this narrative I'd like to explore. There is a woman... I have a feeling things will start to get really, well, unpredictable, when I finally encounter her again. I suppose I'm preparing myself for that. Again, thank you for taking the time to explain all this to me, I truly appreciate you sharing your knowledge. It's nice to be able to discuss concepts that most would deem insane or unrealistic. It makes me feel freer just by doing so.

Well, personal experience is the key - decide for yourself what is true for you. Take on other people's ideas and see what they add to your own understanding/knowing. Yeah, 'love and light', that's the way.

And remember you have to live the humdrum aspects of life as well as the more random/exciting/bizarre ones, while you are still in amongst it! :-)

Have fun - - -

POST: Why can’t the world’s greatest minds solve the mystery of consciousness? | Oliver Burkeman | Science

A1: I'm working on it, shmeesh, hold your horses.

A2: I'm working on my thesis at the moment, here is an early draft:

Haha, spectacular.

...

To Dennett’s opponents, he is simply denying the existence of something everyone knows for certain: their inner experience of sights, smells, emotions and the rest.

Part of the problem is maybe this idea of "inner experience". To me, all my experience appears in a conscious, aware space. So in a way, all of my experiences are inner - that chair over there, that thought over here. There's no separation. But I can't detect an outer in my experience, so really they aren't inner either. This is the background to all experience. Consciousness isn't a thing, it's a context. (Any thoughts I have about my-"self", George, also appear within that context. Which means those are just concepts and not the "real me".)

"To look for a real, substantive thing called consciousness, Dennett argues, is as silly as insisting that characters in novels, such as Sherlock Holmes or Harry Potter, must be made up of a peculiar substance named “fictoplasm”

Which is funny. But highlights the problem: those characters appear in my awareness too when I read about them. In other words, Sherlock Holmes and Harry Potter are made from consciousness. If consciousness is not a "thing", but rather the material from which experience is shaped, then it's either an error or a straw-man argument to dismiss consciousness by categorising it as such.

It’s like asserting that cancer doesn’t exist, then claiming you’ve cured cancer.

It's more like asserting that words and sentences don't exist, using words and sentences.

Well, it certainly doesn't help that our only means of expressing consciousness is mediated by language... a tool of consciousness.

Well, I guess... art? Art and the felt-sense.

But, yeah, as soon as we are using division or objects in our communication, we are already in trouble. How can something point to something that it is made from?

I've actually considered art before, but if you think about it, an artist can never paint anything that fully depicts his entire knowledge/understanding of art

I agree, but I think we can capture "meaning" in art, felt meaning. Sure, not the fundamental truth (because that is what the art is made from, not what it depicts), but it allows us a deeper connection than language.

. . .but as soon as we think about it, we begin to attach all of our comfortable symbols and concepts to the experience we're trying to describe, and we taint it in the process.

Yes, I think that's spot on. Even sitting quietly on our sofa, we can relax into this open feeling, but as soon as we think about it we "ripple the water" as it were. Direct perception and thinking occur in the same space, so to perceive clearly you have to let yourself settle - no forcing, no trying. That's why "there is no technique".

I'd be interested if this was also true for near death experiences...

Lots of them still seem very "content-based". Sometimes people feel peaceful, they often have a sense of a greater connected space, but it seems they are still having an object-based experience. Maybe there's a balance to be had between giving yourself to the experience, and holding back a bit. This might make the difference between dying and not, though...

It's a real shame that the Guardian article is so inaccurate. I strongly recommend you read Consciousness Explained - it's a killer book and I think you'd have a great time with it. In particular, Dennett does NOT claim that consciousness doesn't exist. What he's against is the Cartesian theatre model of consciousness, where a "little man" sits in your brain telling you what to do.

I did read it (about 10 years ago) and its "multiple drafts" model. It's a very enjoyable book actually; he's a smart guy with a nice style. As I recall, the problem with Dennett is actually that he's talking about content not consciousness.

It's quite a nice model for describing the formation of the apparent world as experienced in one's first-person "aware space". In fact, it's pretty close to the idea that our experience is an "ongoing dream 'inspired by' the senses". (The nature and location of "the senses" is another matter.)

But because he's determined to infer what consciousness is from that, he ends up clashing; just as he does when he confuses directed introspection with thinking-about, and therefore sees construction rather than observation. (He really implicitly assumes that we can only apprehend the content or patterns, but this is not true.)

In any other area, it would be a good approach: See what is there, then derive the terms from that. In this special area though, "what is there" and the thing being "explained" (consciousness) are the same thing and therefore outside of your examination, because it is that which all examinations are also made from. Which means in some ways that having a theory about consciousness is meaningless. One can only have theories about patterns within consciousness; that which awareness is aware of, as and within itself. In fact, I think this is exactly true. Now, it's been a while since I read him, so maybe I am misrepresenting!

POST: What are some of your "out there", unconventional thoughts about this reality and your own consciousness?

This life is a dream and each of us is a small fraction of the dreamer. Anything is possible. Nothing is forbidden. But what we do to each other, we do to ourselves.

I like this efficient way of saying it. Do you see yourself as the dreamer?

Hahaha my ego wishes! No, I think we are literally one God-soul, lost within itself.

Yeah, "Phwahaha, you are all my obedient puppets now!" :-)

Doesn't that mean you are the dream character and the dreamer and the dream environment? Meaning "duck_amuck" is a character who borrows his power from the dream, as it were, but he's still the dream and the dreamer too - just as /u/duck_amuck borrows his power from Reddit.

Actually, I quite like that idea, and it fits experience a bit:

Characters borrow their power, so they can only "submit requests" for what they want to do to the larger dream, hoping that the dream will then move them as requested. All the while, of course, they are actually the larger dream all along, pretending they have to ask...?

Here's a picture of duck_amuck hanging out with a chickeny pal, pretending to be separate.

EDIT: Better: They are the larger dream, having confused themselves into thinking they are the character.

Lol to the pic.
But yeah, something like that... Ego is the character. Self is the dreamer. Self has unlimited power, but the character is the one driving the story within its limited scope/means/belief systems.

Self-ego-character, sounds about right. "Big Self, Little Self". Would make a good title for a children's esoteric television show.

Another way is to rebrand this. Self is the universe. Ego is just a bit of that universe. What we call "you" is just the sphere of attention, perimeter of experience we are currently maintaining. We think that we are "ego" when we localise on the region of body-space where selfish thoughts seem to arise (typically, towards the rear of the head); we think we are the universe when we dissolve the perimeter; in-between and we think we make "connections" and have non-local paranormal powers.

Idk what in your post made me think of it, but it's too bad there's not a legit mystery school teaching today... The realization of consciousness and the tools to work with it should be available to everyone.

Yes. There are lots of 'cult-type' efforts and 'self-help' arrangements, but there's nothing legitimate. In school, we don't even teach the history of religions and beliefs/worldviews anymore (as opposed to the content). I am very interested in seeing insights brought into modern, accessible language, together with investigative approaches ('exercises' without any nonsense) a person can use to discover themselves and the world. People like Rupert Spira attempt this to some extent, but somehow it doesn't cover the whole subject (life!) for me.

POST: Just a reminder: There's nowhere to run.

[POST]

:D

[END OF...POST?]

:-/

A1: When you can fly, there is no need to run.

A2: When you can exist in all places at once, there is no need to fly.

A1: When you are both nothing and everything, there is no need to exist in all places at once.

A2: When you simply are, there is no need.

POST: Is anyone here enlightened? (/r/zen/)

Pretty unhelpful phrases, eh. All is that, this is it, that is it, is that all?

POST: Bad posture, muscular imbalance or just bad genetics? (/r/Posture/)

Maybe it's nothing much to do with muscles or genetics? Quite possibly you're just using yourself incorrectly - as a result of poor attentional habits, leading to the accumulation of tension patterns over time. Do you give yourself a relaxation period every day? A time where you just let your body unwind itself without you interfering or trying to make things happen? If not, you should definitely try doing that. Literally 10 minutes on the floor in the constructive rest position, during which you just "give up to gravity" and "let whatever happens happen", can make a massive difference.

Your body is a wraparound complex thing - the idea that you're going to somehow work out what to do to "fix" yourself, and then actually be able to do it, is a bit of a stretch (if you'll excuse the pun). Especially if it's really something you need to stop doing. If you've developed a habit of super-focusing and tensing up, for example, then "exercises at the gym" aren't really going to help - you'll just get more efficient at doing whatever incorrect thing you're already doing!

I wish I was a normal person and didn't have to do shit like this lmao.

Haha, well, I dunno - maybe view it as you're a normal person temporarily wearing a weirdo's coat! Lying down on the floor doing nothing for 10 minutes a day isn't so bad, though. But yeah, I know what you mean.

POST: Former Apple designers: Apple has lost "the fundamental principles of good design" (/r/Design/)

Q1: It's rather ironic that they complained about thin fonts being hard to read when the whole article is in fact written in a thin font themselves.

Q2: At least it's sans serif, right? But seriously, this is true irony. The word is so often misused.

So, ironically, is the word "misused"...

I don't think the presentation really negates the points made; it's just an amusing aside. In fact, it perhaps enhances them: the article points out many instances of breaking design rules, but doesn't offer specific solutions either in the text or via the typography, making the whole piece an excellent example of bad design, in its content and presentation, in a perfect feedback loop. Which, ironically, makes it a good design after all!

Q2: Here's the funny part, the whole website uses that thin font, so they are using it unironically.

Thank goodness I am British; I don't think I'd be able to handle all this irony-linked contradiction otherwise!

POST: Ways a logical thinker can improve visual creativity? (/r/Design/)

So, is your problem one of idea generation? Maybe you need to read around the topic a bit, and to look at how, exactly you are going about "being creative". It is more of an exploration of a feeling than it is a problem-solving mindset. In fact, top tip: you should try literally placing your attention lightly on the centre, or lower centre, of your body when doing creative work - and experiment with thinking from there, rather than thinking about things in the head area. Some suggestions to get things rolling:

- On Not Being Able to Paint, Marion Milner
- Lateral Thinking, Edward de Bono
- Focusing, Eugene T Gendlin
- Experiences in Visual Thinking, Robert H McKim

So I do what is in my head and it does not generally match up with others' interpretations.

Do you tend to be more about the particulars, rather than the overall sense of something? I can't know this of course, but what you say is suggestive of you laying out the details of an approach, but with them taking away a general view of it which doesn't correspond to that assembly - with the details then being filled in with their own sense of it. The two "landscapes" then don't match because you are using different thinking styles.

I'm most certainly not against trying a different way of thinking, though I don't know how one would "literally" use another part of their body to "think from."

If you ponder it a moment, how do you use "your head" to think? Obviously, you are not literally using your head or your brain, but that is where it seems to be happening (the head area in your perceptual space), even though obviously your brain doesn't really correspond to any spatial location in your perception. So the sense in which I mean think from a location, is to interrogate the feeling for ideas, and the "global summary" feeling of a situation tends to be located in the centre of the body. Beyond the reading, all I can suggest is experimenting. Pick a project you are working on, and instead of thinking it out, sort of rest your attention centrally and sit with the problem, and see what comes up. Doing this means that, rather than narrow associative linking via concepts which is what happens with "head thinking", you get a sort of evolving "global pattern" which takes a wider range of things into account as the source, drawing on more abstract sensory connections. (Yeah, sounds vague I know, but if it could be laid out as bullet points for a technique, creativity wouldn't be a mystery in the first place.)

In addition to those books (which I've chosen because they specifically tap into that felt exploration aspect), you might find these acting exercises useful: The Michael Chekhov Handbook - Chapter 4. At first they might not seem connected to what we're discussing here, but they are about "getting global" with your imagination and perceptual space in order to seed creativity. You might find them beneficial.

I'm not sure I understand, but I'll give it my best shot.

It can't really be explained, only explored and experienced, which is of course part of the problem (people often aren't even aware they do this). If it turns out you actually have been missing out on that part of thinking-experiencing, you'll probably find it incredibly useful for a lot more than just design work. It applies in life more generally: it's the ability to see the satellite image and explore the terrain at ground level. Anyway, have a play, and I'd be interested to see how you get on with it. One final thing: **it should be a fairly effortless thing**, "sitting with" that area; **it's not something you have to strain or push for**, it's more like **"letting it come to you"**.

POST: Reality Check: The NSA Hasn't Actually Stopped Spying on Anybody (/r/privacy/)

Q: Lot of people out there saying that privacy is antiquated notion based on barbaric use of meatspace. Hard to argue for the benefits of privacy when many see the future as being free from selfish concepts like that. I personally see this trend for so-called openness as totally deluded, idealistic, and ignorant of the reality of digital security, but it is a very prevalent attitude nonetheless.

Not just ignorant of the reality of digital security - ignorant of the reality of people, and the tendency for people to want everyone else to adhere to the worldview they hold, in all visible behaviour, for reasons of emotion as much as, or more than, logic. A reduction in privacy increases what counts as "visible behaviour", and therefore the amount of people's lives that falls within any potential "corrective measures", be they direct or indirect. It would be a mistake to frame these things purely within a technological context. The main problem is that technology is an enabler and multiplier here, in terms of our personal "exposure radius", for pre-existing issues in politics, society, psychology, etc.

POST: Fermilab Experiment Finds No Evidence That We Live in a Hologram (/r/science/)

Well, the science came first surely? A lot of scientists use the word "hologram" because, well, they are referring to actual holography, or to the broader concept of the entire definition of a system being "dissolved" throughout it, which both seem like valid uses. I'd say it's the popular science press which tends to misrepresent these things, by conflating them with The Matrix, and demanding that research be presented in accessibly pop-culture ways. It doesn't necessarily mean the research itself is of that quality. (There's also a tendency lump lots of different ideas under one heading, which I think has happened with the reporting of this experiment.)

Personally, I don't think much of the research, but I'd defend the use of the term when referring to that particular property. I don't really go with that argument, re: God and manufacturing. For starters, we have to be clear about what, exactly, we mean by "God" and what we mean by "creation". Specifically, when it comes to the hologram idea, we'd have to revisit how the subjective experience relates to the an "objective world" which is holographic in nature. My main problem is therefore that this is more philosophy than science. Which is fine, but it should definitely dictate how we view it in terms of interpreting the theory and whether it should be funded.

POST: @JohnCleese on Twitter: "I would like 2016 to be the year when people remembered that science is a method of investigation, and NOT a belief system" (/r/atheism/)

Agreed. There is probably a more subtle layer to that, which is that everyday people have faith in the "scientific method" more abstractly, as if it is one thing, and that following it means that you get to the right answers. It is in this sense that science can become "like a religion". But that's a bit like believing in "walking" (that there is an activity called walking and it takes you to places if you follow it) and then assuming any destination arrived at by "walking" is a correct destination (the final result is "true" because the process is "true"). The everyday pop-science enthusiast is often someone who likes particular conceptual frameworks that we've constructed, and perhaps mistakenly thinks we are discovering how "things really work" (the reification of abstractions), rather than science itself. This is not necessarily their fault - the "gee-whiz" approach to scientific reporting, and perhaps even the hyping that happens for funding applications, often misrepresents the situation.

POST: The \$58 Million Frivolous Lawsuit Against Richard Dawkins is Finally Over (/r/atheism/)

Richard Dawkins was indeed an excellent biologist, but that has not translated into him being an excellent philosopher or social commentator. I would argue that he is not a good figurehead for science. His public image is a bit of an embarrassment, I'd say, and antics like that movie do not help. Plus, even now he constantly makes references to "truth" when discussing science, which rather misses the point. He is quite successfully damaging his own reputation, all by himself. Where's the Richard Feynman for today? That guy knew how to approach these things.

...

My opinion does of course matter - **to me**. There's no opinion more important, surely? Everyone else's opinion is just potential input for that, nothing more. Surely you weren't saying anything much, beyond promoting some vague notion that criticising Richard Dawkins' approach - and criticising it by using pretty much the same language that Dawkin's himself uses - is equivalent to slander? If you agree with his approach then that's fine of course, but your tactic when responding above seemed a bit evasive. Defend the approach, not the man. He's just some bloke, like everyone else. For example, do you think that movie was a good idea? I think that sort of thing alienates the very people we'd want to get on board. And also people who would otherwise support the idea for a group promoting rational thinking, etc.

...Ah. You're a "fan". This isn't about reasoned argument and discussion at all, and it's going to continue as being a fighty rant I guess. No worries, sorry to have interrupted - I misunderstood what was happening here.

See, I don't think either their comments or mine were insults or ad hominem. They were critical of an approach, critical of the man for taking that approach, and describing how he comes over as a result. They weren't insulting him personally, or attacking the man himself rather than his take on things. I don't see the problem with being a proponent of science and rationality in society and thinking that Richard Dawkins isn't a good example of how to go about this. Your response above seemed disproportionate, as if to allow criticism of Dawkins was equivalent to conceding something to "the other side". (That could be me misinterpreting you though, of course.)

Again, I wasn't looking for some sort of battle on this, since it's ultimately not that important on a personal level (and I'm sure it's not for you either). I would have been interested in hearing in some reasons why Dawkins' approach was a good one, though, because maybe I'm missing something.

Is it not valid to criticise how someone comes across? Especially when they've become, unwittingly or not, a public spokesman for a particular point of view?

As you note, the original comment says that he finds Dawkins to be insufferable. The rest of it is, as I interpreted it, a view on the impression Dawkins gives by his approach. This isn't a criticism of Dawkins' underlying worldview necessarily - although personally I disagree a little there too - it's a criticism of his presentation of those views, of how he appears as a representative of a group to which I am broadly speaking a part. Again, that's how I read it when I first saw the comment. However --- re-reading that comment now, I'd agree with you that as written it does stray too far towards apparently asserting what Dawkins' "only concern is". At the very least it omits a couple of "gives the impression of" caveat phrases, to make clear that it is referring to the image projected rather than necessarily the man.

...I feel... that you do not really understand what an ad hominem attack is.

So, what if I were to say that in my view Richard Dawkins' public persona is that of an arrogant bully (this is not quite what I think, but let's go with it as an example)? Would that be an insult in your view? Would that be an ad hominem attack?

Note: I am not using that in order to discredit anything Dawkins might have to say. My point would be simply that his behaviour does him no favours when trying to convince people of his arguments - and therefore I do not consider him to be a good spokesman for science.

...Sigh. You are being somewhat deliberately obtuse there, are you not? I hope so, anyway. My full comment is pretty clear as to my intention, as was the original commenter. Which was to express an opinion as to Richard Dawkins' appropriateness as a spokesperson for science, independent of his specific arguments on religion, and despite a shared enthusiasm for a greater role in scientific thinking in how the country is run, and so on. Your initial responses, however, seemed to imply that insults and ad hominem

attacks were being used in place of arguments against Richard Dawkins' views, that declaring an opinion Dawkins approach was problematic was itself problematic. This was not the case. Now certainly, we could restructure this as a discussion on the effectiveness of Richard Dawkins' approach, although as you point out, this is going to quickly reduce to largely opinion and anecdotal evidence. Which is why it was phrased as an opinion ("I feel"...)

...

Well, let's return to your original response to the parent's statement. The parent said:

I find Dawkins to be absolutely insufferable. His mission in life seems to be to ridicule anyone who he deems to be his intellectual inferior...

- EDIT: Including the rest for clarity:

...which is anyone who doesn't idolize him. He doesn't care about informing people, or even about the scientific method; his only concern is to bully anyone outside this circle. He actually made a "documentary" which is basically him recording interviews with laypeople, and then putting on a wannabe stand-up special for his acolytes. There is nothing honorable or admirable in his behavior. True men and women of science will stop at nothing to spread the fruits of their research, and educate the masses; they certainly won't go out of their way to intimidate those who need guidance the most. And as a lover of comedy, he's not even all that funny!

Dawkins had said:

"It is absolutely safe to say that if you meet somebody who claims not to believe in evolution, that person is ignorant, stupid or insane (or wicked, but I'd rather not consider that)."

And you said:

What you're doing right now with your slander is worse or on par with anything Dawkins has done that you want to lambaste him for.

Really?

After that, you're just making shit up as you go, I'm afraid. Well done on inventing a position or two as you went along and putting in some decent effort trying to support them, though. For our entertainment, I presume. It was an enjoyably windy path, if nothing else!

It was just a fun ironic way of wrapping it up. ;-)

I included the first couple of sentences with ellipses to indicate it was partial - you know what the rest said. However, I've just added an edit with the remainder for clarity, so as not to misrepresent things. Let's face it: your own goalposts, if one can call them that, were all over the place during this exchange. There was little reasoning as far as I could tell, only references to reasoning. Saying something repeatedly doesn't make it so, and couching it in combative language doesn't help either. Because, I guess, you're not here to contribute anything? But you could be!

Throughout your exchanges, all I could think of was: what's the point? You're obviously a smart guy, but focusing on trying to "win" arguments like this instead of exploring actual topics is just a waste of everyone's time. While you're fighting the fight of shifting definitions and straw man gotcha moments, someone else would be having, say, a creative discussion about how science can best be communicated to the public - how people could be drawn in by seeding genuine enthisiiasm, perhaps - if the currently predominant low-content antagonistic exchanges were avoided. We have to sell our positions by their presentation as well as their sound content, and make our groups attractive in order to get people to listen in the first place. This has been an example of how not to do that, I suppose.

I think the full excerpt makes the point more clearly, frankly, and contrasts more strongly with the Dawkins quote. It was indeed a mistake to omit it. It was (unintentionally) dishonest of me to weaken the impact of the comparison. Let's face it, you got yourself stuck in a pointless side argument about insults and ad hominem, while completely bypassing the actual issue raised: Richard Dawkins' approach. It's the worst sort of "discussion". The parent offered an opinion on Dawkins' approach, which is illustrated nicely by the Dawkins quote itself (which does not phrase itself as an opinion, but as fact). You were on shaky ground with the accusation of slander, and then you wasted the rest of the conversation trying to prop it up. Now, I agree on the mudslinging-as-distraction issue, but I do not think the parent comment was mudslinging as such, simply a declaration of dissatisfaction with an illustration, referring to the documentary, of why that was so. It was you who made it an issue, and it seems like you don't really care one way or the other in any case - which just doubles-up on the wastage really. We could keep doing that reply-with-final-signoff thing, but that would be yet more time wasted. I was quite sincere when I said I was disappointed with how this exchange turned out, by the way. Maybe we'll do better next time. Cheers.

...

So - we ended up having a discussion about the topic rather than the topic itself! Damn, I meant to stop...

Okay, let's put aside our prior tussling, if you're up for it - do a soft reset and take one aspect. Let's take two quotes: the one by Dawkins, and then I'll make one up for myself for the sake of discussion. We have:

Dawkins: "It is absolutely safe to say that if you meet somebody who claims not to believe in evolution, that person is ignorant, stupid or insane (or wicked, but I'd rather not consider that)."

and then:

TriumphantGeorge: "I feel that Richard Dawkins' approach comes over as arrogant, combative and alienating, which is problematic for someone who has come to be perceived as a public spokesman for science and rational thinking."

Now, we could get bogged down in how reddit user TriumphantGeorge's opinions are not particularly sought after, or what evidence there is for either of those two statements. However, can we concentrate on: do both statements represent the same approach, are they of the same type?

I would say that the first of these is a statement of definite objective fact, and that the second is a statement of opinion. If the first functions to shut down the argument (insult and ad hominem), then the latter functions to highlight a perceived problem (and potentially start a discussion). **What do you think?**

Well, isn't the whole point about whether the two approaches amount to attacks on character in the same way? That's what we're working towards. I agree about "I feel..." to an extent. Although it softens the language, and might assist in the art of persuasion, it doesn't affect the content as such. It does however change what we are declaring a fact of, and this can make the difference between being insulting and not, surely?

The more important thing is: The first statement is an assertion that a person is a certain way, whereas that second statement is an assertion that a person's behaviour makes him appear a certain way to the quote source.

- **Dawkins** is asserting that people who claim not to believe in evolution (interesting structure) are ignorant, stupid or insane.
- **TriumphantGeorge** is asserting that Dawkins behaviour makes him appear arrogant, combative and alienating. (And that this appearance is problematic given his public position.)

The two statements are, I suggest, still different in type? Dawkins is still directly asserting something about people (and has short-circuited the argument about whether evolution should be "believed in" or not). TriumphantGeorge is still asserting something about a perception - or at worst, behaviour - and is then giving an opinion based on that assertion. It's the difference between "you are stupid and your argument is therefore worthless" and "your behaviour makes you appear stupid and so your arguments don't penetrate". At this stage, I'd be tempted to say Dawkins is being insulting, and it is probably partly the intention. Meanwhile, he is perhaps engaging in an ad hominem attack. (This is slightly open to question due to the context, since it's an equivalence that's being proposed: lack of belief in evolution = stupidity.) TriumphantGeorge is perhaps being insulting, however it is not the intention. However, he is not engaging in an ad hominem attack. (An attack on Dawkins' behaviour isn't being used to discredit his views.)

Firstly, agreed on cherry-picking in general. We're kind of going context-free with our examples, just to bring it out, but often that's where half the troubles begin. The media are often more focused on reporting (creating) the controversy than reporting a logical argument, and Dawkins has been targeted more than few times. (I'm not sure he does himself many favours sometimes, though! But then, should he have to?)

Anyway...

There isn't much of an actual difference at all. Don't insult the person, target the behavior!

I think that "isn't much of an actual" is important. If we strip away all the nuance, we're not getting to the "real message" - we're throwing much of the message away.

"you are stupid" vs "your behaviour makes you appear stupid [and is creating problems for your cause]".

Surely the latter is targeting the behaviour? Rather than calling someone stupid, we are saying: "your behaviour is making you appear a certain way and I think it's having an undesirable effect". Now, if the person saying that is known to be malicious, then it might be construed as an insult. But if the intention is benign - TriumphantGeorge's intention, say, is to increase the acceptance of science-based worldviews, and improving Dawkins' image would be beneficial for that - surely it is not?

The next step would be to go into what behaviour and how exactly it makes them appear stupid. So really it's a contextual thing. In the first example, there's no context that can prevent it being an insult. In the second example (and your version), the prior and subsequent statements can provide a context which dictate how it should be interpreted. On it's own though, I'd suggest that it is "neutral, if uncomfortable", rather than insulting.

...Seriously, that's your response? Oh well.

Actually, I think I misread your intention in that comment. Were you insulted by my response? Is there a larger context in which it wouldn't be insulting?

So...

Aren't we perhaps perhaps making an artificial division here, between context and intention, that doesn't exist in practical terms. Or perhaps, we're being tripped up by the language I used. How we read intentions is by the context, surely. In the "behaviour" example, it's the larger context which would tip us off that the statement criticising behaviour was not intended as an insult. Namely, that the person making the comment was concerned about the presentation of the topic, and had no animosity towards the person aside from that. (If every comment on someone's behaviour was an "insult", wouldn't that be problematic?)

In the "stupid" example, yes, there are contexts in which making that statement would not be insulting. (If there was no allowance for context and nuance to shift the meaning of that sentence, that would be problematic too.)

We've drifted a bit from the initial quotes. Paraphrasing: "if you don't believe in evolution then you are stupid or insane". Now, taken alone that is pretty insulting. However, as part of a larger essay with a light-hearted and comedic tone, it's isn't necessarily. All good. Which takes us to: Who is the judge whether a statement is insulting, who judges whether the context changes that, and whether being insulting invalidates the comment?

If we say: "In my view this person's behaviour give the impression that he is arrogant, and that is damaging the cause which we all support". Who is that insulting to? And does it invalidate the statement? What if many people agree with that assessment? Is there a particular majority percentage required, before we can say that it is true and it doesn't matter whether it's insulting? After all, the person in question might be deluded about their own behaviour and impact. Maybe they just aren't emotionally capable of understanding the context, for example. Basically, is it always insulting to say that Richard Dawkins' behaviour gives a bad impression and is damaging the cause? Who "owns" the being-insulting?

...

Probably more likely is that they "keep sciencing until..." one of them is dead.

POST: Royal Society calls for review of European GM ban: says science misunderstood by the public (/r/skeptic/)

I'm guessing that OP was alluding to concerns regarding intellectual property rights and gene-use restriction technology. Basically, the possibility that genetic seed sterilisation plus international agreements on IP could lead to much worse monopoly situations than patents, and devolve reduce the ability of governments to retain control over their countries' food supplies ("food sovereignty"). These are legitimate concerns I think. As I understand it, though, there's been a 10-year moratorium on the commercialisation of GURTs. I don't know that the current status is, but if GURTs were to be explicitly forbidden with no intellectual property back door left open - for example, no opening for a investor-state arbitration push - then perhaps things would ease up regarding GM. So really, OP has made a fair point: it is likely this isn't a "science or food safety" issue, and it is for "economical reasons" and control of food supply - just not in the way you have presented it in your response (which seemed like a wilful misreading in places, I have to say).

TL;DR: It's not about Monsanto "controlling the food supply" in particular, it's about food sovereignty issues that might result from GURT-type technologies and IP in the future (perhaps combined with TTIP-style arbitration).

Where's the "destroy the food supply for all of Europe" bit coming in? I don't think that would be good business for anyone! And this is, surely, about business. It's not "controlling the food supply" in some apocalyptic sense. It would be more about cornering the market: about where the money was flowing, and lock-in to particular products. GMOs potentially have the ability to become an ideal technology for creating monopolies in a way that patented crops do not. The starting point here, I think: it seems very unlikely that the EU ban arose due to "science or food safety" in terms of the final customer, so what was its purpose? Was it a delaying tactic, related to legislation, TTIP negotiations, or development of technology locally?

The worry [they have] isn't that the food will be made "too expensive" - although price gouging would perhaps be an issue and you might end up with food being "as expensive as it could be" - because quite possibly governments and their related corporations could benefit from that, even as their citizens would not. The worry would be the transfer of political and economic power more generally to those corporations (and their host countries). We might draw a comparison to our situation with energy companies and international oil markets, as an example of where these people don't want to be again. Remember too, although you and I might have as primary the idea of "making an efficient food supply for the citizens of the world", that is not the necessarily goal of the individuals in governments and companies. They see things in terms of power dynamics. Particularly lately, in countries like the UK, "the country" has been conflated with "the economy", and "the economy" has been conflated with "the particular subset of society aligned with the individuals in government". Science is used as a tool, here, not as a source of truth upon which decisions are made. Science which justifies the adopted position, is used, that which isn't, is rejected. (See: fracking, drug legislation, climate change, etc. See also: silencing of inconvenient findings.) The true underlying position may be due to business, moral, or party political interests, all vying against one another. So, I've drifted a little there, so let's come back to: It seems unlikely that the science of GMOs - by which I mean, concerns about the environment and food nutrition as such - was ever the reason to ban them. Rather it was due to the potential effects on the interests and "visions" of the governments, politicians, and their favoured businesses - both professional and personal. The "doubts" about "food safety" were always being used as a propaganda tool, in the same way as "doubts" or "debate" about climate change were - until it suddenly becomes politically or economically convenient to shift position. This of course makes it quite hard to get to the bottom of things. Whereas in science we can talk of evidence extracted from a reasonably stable and publicly available "objective world", here we do not have access to "observations" and there generally is no stable substrate upon which events are unfolding. (See: economic and political theories, for example. They are really narratives rather than true models.)

TL;DR: The actions of governments in this area may seem illogical, but that's because they are not operating at the level we assume. Policy is not science-based and not always economics-based in a straightforward way.

I was kinda thinking that you had read too much into it! But I figured I'd just go with it anyway to see where we got to...

I'd say that a ban was solving the issue at hand through "reform and law"? By which I mean, the issue at that time, which was to prevent a shift in power over local agricultural, perhaps. Calling it "economic protection" probably simplifies this too much; again, it's more about sovereignty. Do you really think that "people's puritan green ideologies" are what was driving this? In other areas, this doesn't seem particularly problematic. Fracking in the UK, for instance, doesn't seem to have been hampered too much. European governments are really not so easily swayed by their populations; I think that they've been quite happy with the last 10 years, and maybe now they're ready to switch (hence the shift in media presentation).

POST: Beside personal anecdotes, what evidence for anything paranormal exists for which you adamantly believe in? (/r/Paranormal/)

we at least know the probability of getting it wrong or right.

Really? How do we calculate this probability?

It's important to realise about science is that it doesn't tell you how things actually are - it does not reveal truth. Rather, it is a process by which we make observations, identify situations which appear with regularity, and then invent concepts and stories to connect them together for the purposes of description and prediction. For instance, there is no such thing as "gravity" other than as a concept - in fact, the concept called "gravity" has changed quite a lot over the years. However, it has been an extremely useful connective idea. In science, observations are primary and theories/models are secondary:

- Observations limit the possible models.
- Models do not limit the possible observations.

The whole "paranormal" thing is difficult, because by their nature the phenomena reported aren't repeatable, either on demand or under a controlled conditions. So we shouldn't dismiss it as "not existing". We must simply say: "science has nothing to say about it at the moment". Otherwise we end up dismissing things like ball lightning:

Until the 1960s, most scientists argued that ball lightning was not a real phenomenon but an urban myth, despite numerous reports throughout the world. Laboratory experiments can produce effects that are visually similar to reports of ball lightning, but whether these are related to the natural phenomenon remains unclear. Many scientific hypotheses about ball lightning have been proposed over the centuries. Scientific data on natural ball lightning are scarce, owing to its infrequency and unpredictability. The presumption of its existence is based on reported public sightings, and has therefore produced somewhat inconsistent findings. Given inconsistencies and lack of reliable data, the true nature of ball lightning is still unknown.

The tendency of modern scientists (or actually: popular science reporting) to imply that if our theories don't accommodate something then it is not "real" is a foolish misunderstanding of the method - and something that the great men and women of science last century would have laughed at.

Gravity isn't real but only as a concept? Then how the hell do we send space probes out 3 billion miles to hit a target that is 65 meters by 75 meters?

"Gravity" is a concept we invented to connect certain observations. That concept allows us to make predictions, including those relating to the launching of projectiles. It is a real... ly useful conceptual framework. Come back to what we actually observe - objects in motion. We never see gravity, and gravity itself as a concept has been changed many times. What is real is the observation that "objects move in relation to one another even in the absence of contact". The rest is a story to link those observations. If you don't understand that, then you don't understand science and the nature of theories at all. It will lead you to think theories are "how things really truly are in reality" and you'll end up being defensive and arrogant and warrior-like about the theories of today, even as others are trying to replace them with the fresh observations and theories of tomorrow. Of course, this is old news: science often only moves on when proponents of the old theories die. (I'm not implying anything by that, I hasten to add.)

EDIT: Recommending this Physics Today article and this Nature paper to help clarify where I'm coming from. Thanks to /u/ccarrot for the first link.

Q1: Related reading... [<http://www.ehu.eus/aitor/irakas/mes/Reference/mermin.pdf>]

Thanks for that - new to me! Reminds me a little of this Nature paper, although more thorough. It's amusing to note how the groundbreaking scientists of the early-to-mid 20th century were all philosophers as much physical theorists (e.g. Bohr as mentioned in the article), but in today's science-as-engineering-certainty view the philosophical ideas are often dismissed as "mystical meanderings" of the wayward minds of retirees (e.g. Schrodinger's What is Life? lectures; Pauli's collaborations; Bohm's ideas). Actually, those meanderings were the basis for the physics, and there was always caution separating the "thing-in-itself" from the description. I guess that's a problem with how these things get taught in school and university: "here is how it works" is the approach, and students start to confuse ideas with existence. Paul Feyerabend should be mandatory on the syllabus! :-)

[QUOTE]

Philosophy of science of article Paul Feyerabend

In his books Against Method and Science in a Free Society Feyerabend defended the idea that there are no methodological rules which are always used by scientists. He objected to any single prescriptive scientific method on the grounds that any such method would limit the activities of scientists, and hence restrict scientific progress. In his view, science would benefit most from a "dose" of theoretical anarchism. He also thought that theoretical anarchism was desirable because it was more humanitarian than other systems of organization, by not imposing rigid rules on scientists.

[END OF QUOTE]

It can't though. There has to be a start somewhere. Stars don't form out of the blue. We need stars to have planets and the other elements that we see.

Well, nothing has to start somewhere - that's a limit of our imagination, surely? In the same way we find it hard to imagine that something doesn't have boundaries, that there might be no "outside". Sometimes, we might be asking the wrong question. After all, what physics actually is, is a "bunch of cool ideas that some people have had". We've already been round the loop a few times, I'm sure there will be more ideas to come which flatten the previous ones. Change is fun:

The universe may have existed forever, according to a new model that applies quantum correction terms to complement Einstein's theory of general relativity. The model may also account for dark matter and dark energy, resolving multiple problems at once.
-- No Big Bang? Quantum equation predicts universe has no beginning, [Phys.org](#)

EDIT: Oops, sorry, I see this has already been brought up. I will add that, yes, "they are discussing it but that does not mean it is a fact". However, that is precisely true of the big bang, dark matter, and all that, as they stand. They are connective ideas not observed facts. All of them are invoked mainly to make the math work (see George Ellis' Nature commentary for a good moan about that). Disclaimer: I am an admirer of David Bohm's work generally.

Physics is the mathematical law that describes our universe. It's way more than just a bunch of cool ideas.

What I was getting at is, physics is a collection of concepts and frameworks that we have invented, inspired by observations.

No it's not because the Big Bang is described using physics. It's not an idea, guess or anything like that.

Of course it is. "Described using physics" just means we are using a certain language and set of concepts. A 'theory' is a description which fits observations and/or other theories. If that's not an "idea", what is? There are plenty of theories which offer another interpretation to things like the big bang (one of them being based on Bohmian mechanics). Things fall in and out of favour. Another take: do you think that the multiple solutions in the equations of quantum mechanics indicate that Many Worlds are literally "real"? Or do you believe that the delayed choice experiment indicates that a participatory universe dictated by the observer is "real"?

“we are participants in bringing into being not only the near and here, but the far away and long ago.”
-- John Wheeler

Only the observations are real(ish). I did study physics...

POST: I'm going to change the way you view Lucid Dreaming (/r/LucidDreaming/)

[POST]

This post is mainly directed toward everyone posting stuff about how they "Can't lucid dream and have been trying for months to no avail."

Now, this may just be because you haven't fully committed yourself to journaling and dream recall, but in many cases, including my own at one point, the reason you're not having lucid dreams is because you're making yourself believe that it is a difficult feat to achieve. **I am here to tell you that lucid dreaming is the easiest thing you can do.** It's not about rules - because there are no rules in dreams. The reason you can't have lucid dreams is because you don't think you can. You've had the idea drilled into your brain that "Lucid dreaming is hard" or "you've got to go through the process before you can have one" This false ideology is the farthest thing from the truth - when you can finally bring yourself to realize that all you have to do is believe that you can, you will. I know it sounds cheesy, but after 15ish lucid dreams, I can tell you that lucid dreaming really isn't that elusive after all. Hope this advice can really help you guys, it made the difference for me.

EDIT - sorry, formatting on mobile is a pain

EDIT2 - thanks guys for all the feedback, both in agreement and in disagreement. Let me clarify my point a little bit though. u/UmriiFluff pointed out that simply telling yourself it is easy may not work, and this is true for some, especially when they've been dismayed from numerous failed attempts. I was trying to say that if you are able to truly adopt the mindset that you have the ability to lucid dream, having them will become much easier, because you are completely confident in your ability to do so. So even if the simply telling yourself you are going to lucid dream works for you, more power to you. But when you can fully grasp your own ability to lucid dream, you will undoubtedly be able to.

[END OF POST]

This is true. Just saying it doesn't work though. You have to have truly decided that you will be lucid dreaming from now on. It's the reason I think for the "beginner's luck" that people often have. Just the enthusiasm and unquestioning focus gives a result. The more they read, the more they become uncertain in the dream, and the more faltering their dream environments tend to become. Can you summon the feeling you would have if you just knew it was true that you would lucid dream tonight? That it was a future fact, right now? That's the sense you need to have.

EDIT: "Summon certainty!"

...

You can't just believe in the way most people think of that - telling themselves they will or thinking it's possible. If you believe in something, you know it to be true, it is a fact to you. That's the feeling you have to have for this to work. You are effectively going to be jumping ahead to the feeling you would have if you were already lucid dreaming every night. How to do this? Well actually, you can summon that feeling of certainty, imagine it to be absolutely already true, right now. It'll feel exciting. But **you have to fully commit to doing this.**

Still, I find it challenging to gain more and more control over the dream and my behaviour while lucid, having accurate memory and other cognitive functioning, making the dream stable and so on.

Is that because you doubt you can - perhaps you think there has to be some technique involved, something for you to master? So long as you implicitly believe this, you won't quite get there. It's tricky that way! :-)

POST: The secret of very long and stable lucid dreams (/r/LucidDreaming/)

My feeling is that all of these techniques are indirect - but they all have something in common. This occurred to me a while back when trying to improve my posture, and I realised that all the bodywork techniques were really about... expanding your feeling-sense or presence into the space around you, and everything else falling into line spontaneously. In short: maintaining a relaxed, open awareness that is expanded into the perceptual space around you. What you actually seemed to "do" to bring this about - a body action or mental manipulation - was irrelevant: you could actually just skip straight to it. In lucid dreams, if you let your attention narrow down into the body area, it's a sure-fire way to end the dream. Warnings not to contemplate the dream are essentially warnings against this. Maintaining tactile sensations, spinning around, looking at your hands, is a cheat to keep your attention open. (Implication: it's perfectly okay to think in a dream, so long as you don't mistakenly assume this requires you focus your attention down to the thoughts, thereby withdrawing yourself from the dream environment.)

So, next time you are in a dream, try expanding your sense of presence - expand your "you" and feel out into the dream, to that you are in open focus rather than narrow focus. Note, it's more of a relaxing-out than a forcing-out. Open attention is actually the default once you've got used to it, so what you are doing is leading yourself to cease constraining your attention. You can also try this in everyday life, since the situation there is exactly the same (except for the sensory content). What you'll discover is, your true situation is that of an "open, aware, perceptual space" in which experience arises - whether that's a waking experience or a dream experience. (This realisation allows us to make sense of experiences such as these [Darkroom Vision & Chef Hats & Dreams].)

POST: Became Lucid, and held a meeting with all my dream characters discussing THEIR reality... Anyone have a similar experience? (/r/LucidDreaming/)

Q1: I tried getting a consistent dream character into the waking world. Now I have a voice with me the entire day. Best decision ever.

Q: *[Deleted]*

I'm sure you do too, it's just that they happen to have the same sound as the one you create with your vocal cords. But your mind doesn't have vocal cords, so this doesn't mean it is "your" voice...

I talked to a psychologist just the other day. Voices and characters in your mind, as with most things mind, is normal as long as it doesn't get to extreme levels. Personifications of aspects of the mind are not uncommon among people.

I totally agree. Anything that appears in mind is "part of you", surely. (Which could go beyond thoughts and into perception of course, if we get more philosophical and metaphysical.)

My sort of joke was that people get hung up on voices that aren't the same as their spoken voice - as if internal voices in their spoken voice was somehow "more them" and others weren't. But really, the only thing that matters is whether mind-content is improving or reducing your ability to live your life as you want to.

...

So - when thoughts appear in your head with "your" voice, are those thoughts always deliberate? Or do they just happen? Because if your mouth started just saying stuff without you willing it, you'd probably get worried. Why aren't you worried when your vocal thoughts do the same thing? If they just happen by themselves, how are they even "your" thoughts? Just because they sound like your spoken voice? Hmm...

I think you're partly replying to the wrong comment. It's /u/luigi_L who's created a permanent voice. Me: I'm just having some fun with the recognition that it is very hard to justify seeing any internal voice as particularly yours (as in: your conscious wilful self), unless you are deliberately creating the thought. "Believing" it to be so doesn't make it so. Just because it sounds like the voice generated by deliberate use of your vocal cords, doesn't make it so. The voice /u/luigi_L has created sounds like a tulpa, which is an apparently autonomous consciousness in your mind (see definition below). The more you look into this, the more you realise that your own internal voice seems more like "the first tulpa", rather than actually you. You are basically harbouring a fictional "you" in your mind, treating it as if it were actually you, and that its statements were your own. A case of mistaken identity!

From the subreddit FAQ, which makes for interesting reading:

A tulpa is believed to be an autonomous consciousness, existing within their creator’s mind, often with a form of their creator's initial choice and design. A tulpa is entirely sentient and in control of their opinions, feelings, form and movement. They are willingly created by people via a number of techniques to act as companions, muses, and advisers. Tulpa forms can either be visualized in the mind's eye, or with practice seen as a hallucinatory figure.

Q2: I don't agree with that definition. I concider it correct the moment you add: ";or at least gives that impression." You cannot conclude the definition objectively, but you can't deny that it does feel that way. With that said, I like to add that something that comes with tulpamancy is: "What is a person." What are you? What isn't you? What does identity mean? What does consciousness mean? Is consciousness nothing but an illusion? etc
You are basically harbouring a fictional "you" in your mind, treating it as if it were actually you, and that its statements were your own. A case of mistaken identity!
It is a good description, though -- again -- some question it more deeply. What is identity?
"Person" is a philosophy, and everyone has his own. Nevertheless, an illusion or not, it usually has a great positive influence on the guy's life.

Yeah, the definition is just a direct quote. I don't personally think that the concept of "being objective" makes much sense when it comes to this, though. There is no "outside" to a tulpa. We can add the caveat words, but I don't think they add anything to the definition, practically speaking. Agreed on "person". I see consciousness as the context within which and of which experiences arise. What "you" are is that conscious perspective, that which experiences. Everything else is content. The distinction between one part of experiential content and another part then becomes arbitrary. We often do it according to spatial proximity (things within the body boundary are "me") and temporal persistence (things that are unchanging or recurring are "me"). In truth though, all of experience - "mental" and "physical" - is arising in one's "perceptual space" or mind. So, personhood is an illusion in the sense that there is no object that we can call the person, but it is real as an experience and as a grouping concept. Then again, even "object" is a concept, we realise - which leads us to recognise objects (bodies) and concepts (persons) as actually on the same level of reality fundamentally (as patterns in consciousness).

POST: Anyone else wake up doubting whether they were really in control or not? (/r/LucidDreaming/)

How would you tell the difference? What test could you perform? And if you can't tell the difference, is there any difference? I'd say they are the same thing: in both cases you would be "having the experience of controlling your dream". Any thoughts you have about that experience subsequently, are another matter.

There may be some kind of distinction but I think you're probably right

Exploring this further, one possible distinction we could make might be to establish: Is our control of the dream "direct", meaning that our thoughts and actions in the dream are what causes the changes? Or is it "indirect", meaning that the thoughts and actions are just theatre? In other words, the apparent cause is also a result of control, just as much as the apparent outcome - and what we are really doing is "re-patterning the dream" via a sort of intention, with action and outcome then being equally "dreamed".

Yes, this is exactly what I meant! Hmm, interesting and slightly eerie stuff.

And then there's the natural extension of these ideas into everyday life: Is it perhaps true that everything we experience (thoughts and body movements and perhaps even perceptions) is a result, and the cause is "before" this, in the form of intention?

This would mean that we are like "shape-shifters", in the sense that we are "perceivers" who re-form ourselves as a pattern by deciding what is to be, and then subsequently experience body movement, and so on, which are part of that pattern. All action or "happening" is actually an outcome as experience, and experience is created indirectly! Or something along those lines. (Obviously we are getting very abstract at this point.)

POST: I just made a breakthrough in my ability to control dreams, here is what worked for me (/r/LucidDreaming/)

Really, if you can conceive of something at all then that's effectively a memory (a thought pattern that exists and you can access) which you can make 3D-immersive and experience more fully. As your post implies, you can't do it by "manually" trying to create the experience (like "drawing it" on the screen of your dream), you have to sort of request-summon it and let it come to you. Just like recalling a memory in waking life!

Q1: Well, I think the question of wether concieving a new idea, structure or labdscape is fundamentally similar to recalling a memory is far into highly advanced neurobiology and well beyond most, if not all, people's current knowledge of the field. I don't feel it is safe to assume the processes of imagining something and remembering something are alike because both are "thought patterns" in our brains.

Hmm. Forget about brains, I'd say, when it comes to this?

We have no access to our own brains (in the sense of a correspondence in type between subjective and objective) and neurobiology is in its infancy. And when it comes to consciousness, there isn't even an idea of what a theory would be like, never mind an actual theory. Memory also lacks a decent account (the location of memories, and therefore the process of retrieval, is still unknown). Nothing much of use for us lucid dreamers. So practically speaking, the important thing is the subjective process, because that's something we can actually investigate. Which leads me to...

Whether a memory or a thought or an environment "actually" exists prior to your experiencing of it or not is pretty meaningless. However, it must exist in "logical space" - it must be conceivable, a possibility. Experimenting a bit, the process of creation and discovery both seem to take the form of triggering part of a pattern, and having the rest of it "autocomplete" into experience. A type of associative traversal or "creation by implication". So "imagining something" and "remembering something" booth seem to be a similar subjective processes - both involve triggering patterns in logical space, it's just that one of them (the "memory") has been activated before, whereas the other (the "creation") has not.

Q1: While I do agree that it is immensely dissatisfying that we as of now do not have the scientific theories and framework to describe dreams and conciousness in a detailed way, I do not think that gives any more credibility to subjective and personal speculations. They remain just that, speculations. While this is frustrating, we really have much yet to uncover about the inner workings of our immensely complex brain. This does not mean we should stop practicing the highly enriching experience that is lucid dreaming or stop developing sucessfull techniques for mastering it. I just do not think being lucid dreamers gives us any expert understanding of our brain. Secondly, I disagree that just because both imagining and remembering are processes in "logical space", in that they are conceivable, they must be alike. I think the notion that when ideas or constructions share some properties this implicates, or even suggests, that they share all properties is very illogical and wrong. To summarise, I think we should just accept that we do have very limited knowledge in this field for now. As you say, neuroscience is in its infancy, who knows what serious, structured, scientific research might teach us in the coming decades and centuries?

Thanks for your interesting thoughts. EDIT: Tidied things up a bit, apologies for length.

My Short Answer

The concepts we use to describe the external view are not necessarily the ones most useful for describing the internal view. Just as the fictions of “fields” and “matter” prove to be useful abstractions for exploring and optimising the physical, so others may be useful for things like lucid dreaming. One day the two may join up, but we’d be foolish to elevate and restrict ourselves to the ideas in one realm when exploring another. Since science isn’t about truth - rather, it's about creating useful fictions which connect observations and have predictive power - this approach can be equally applied in the shared, waking realm and the dreaming, personal realm.

My Long Answer

I do not think that gives any more credibility to subjective and personal speculations. They remain just that, speculations. . . Speculation based on personal experience is of little help to gaining true understanding.

I disagree with this. Experimentation within personal experience is exactly the way to gain true understanding of how personal experience works as personal experience. An MRI scan of someone's brain, for instance, is no "truer" than the experience the person in the scanner is having at the time. It is simply a different (and still subjective) representation of the same thing, which cannot in itself be grasped.

Secondly, I disagree that just because both imagining and remembering are processes in "logical space", in that they are conceivable, they must be alike. I think the notion that when ideas or constructions share some properties this implicates, or even suggests, that they share all properties is very illogical and wrong.

Of course, I’m not suggesting that sharing some properties means something shares all properties. All that matters is that they functionally share the same properties. What I am suggesting is that in terms of direct experience, when experimenting in a lucid dream environment, one cannot differentiate between the processes of creation, discovery and recall - and that this leads to a useful description.

- All three can be described as the “associative traversal” of a logical space. (By which I mean an abstract configuration space containing the next-steps which might follow from a particular state.)
- The dream environment in effect has the properties of a 3D-immersive strand of thought arising within the perceptual space of mind. In particular, experiential patterns tend to “autocomplete” with their implied next-steps.
- Adopting the approach of “thinking your way through the dream” - by recalling or triggering partial sensory patterns (call them memories or ideas) - is more aligned with the way dreaming actually operates than other methods.
- This can be tested by performing experiments while in the dream environment.

To summarise, I think we should just accept that we do have very limited knowledge in this field for now. As you say, neuroscience is in its infancy, who knows what serious structured scientific research might teach us in the coming decades and centuries.

For sure, but that’s not really relevant to understanding the mind on its own terms. It will hopefully one day link the two sides (although I suspect the answer will be: there is only one side). So indeed, I don’t doubt that it’ll change drastically over the coming decades, and be quite different to the direction of today - what with neuroscientists like Christof Koch turning to panpsychism, cognitive scientists like Donald Hoffman playing with interface theories, and QM theories such as QBism promoting a "private view" description of experience. Fortunately, the absence of theories doesn’t mean the absence of experiential truth - just as we explore the subjective external world by prodding it and discussing it, leading to abstractions with utility and predictive power, we can do exactly the same with the subjective internal world.

POST: [Logline] Down On My Luck (/r/Screenwriting/)

I like the general idea, but it seems a bit light for a feature? There needs to be an underlying purpose and something which explains his death/luck duality. It might be more interesting if (random thoughts):

- His misery is required by "reality" in some way, and that's why he can't permanently die (he must suffer so that others can be happy).

Then:

- If he gets into happy situations, "reality" will generate events to kill him to reset his circumstances (he must suffer so that others can be happy).

And:

- The manner of his death dictates the situation he wakes up in, with hilarious consequences and much irony. (Lacking inspiration here, but this would connected by imagery: if he died in a swimming pool he would come to as a lifeguard, if he died as an aviator we would come to cleaning out an aviary.)

The main character's discovery sequence is: finding he can't commit suicide due to luck; eventually finding a way and waking up alive; learning he can't die; deciding to turn things around and be happy only to get wiped; realising he's not allowed to be happy; finding a "cheat" in the definitions of happiness and death to escape the cycle and so allow both himself and others to live happily ever after. For maximum Sandleresque humour possibilities, search-replace "others" with "otters".

Persistence of Vision

Logline: A suicidal optician overcomes a series of unlikely interruptions to take his own life, only to discover that his ongoing misery is built into the structure of the universe. Faced with a choice between eternal unhappiness or the destruction of all existence, he must use his spectacular skills to hack the prescription of reality itself. Unfortunately, the laws of nature do not see things his way...

POST: Why does film make physical reality look more interesting? (/r/TrueFilm/)

An image (moving or otherwise) can have a beauty which is somewhat independent of the subject matter, and instead arises from the more abstract form of the image itself. This includes the way the edges of objects are aligned, their proportions and position in the frame; the way the movement of the camera matches the movement of an actor and follows a particular pattern; the choice of lighting to create additional shapes and contrasts; the colour palette chosen to create appealing relationships. And that's before we've gone into contrasts of meaning and evocation of archetypes, etc. As a random example, even this frame of an annoying man leaning against a car can be in some way beautiful and ultra-real, because of the alignment of the lines of the car, the contrast between machine and natural backdrop, and the pleasing (although now overused) orange-and-teal palette.

A good if extreme version of this can be found in the UK C4 TV series Utopia, where every scene was carefully framed and the palette tightly controlled to give a hyper comic book type effect. See this brief article and check out the images in this search.

Q1: *And that's before we've gone into contrasts of meaning and evocation of archetypes, etc.*
Could you expand on that? Thanks!

It's a bit of a meandering topic - but objects and relationships trigger their extended patterns mentally and physically in the viewer. In the same way as the colour "red" might produce associations of heat, and "blue" cold, so other forms similarly. Note, by "produce" I don't mean they trigger thoughts-about it; they actually trigger the direct experience within you, to a subtle extent. In real life, objects and forms and associations are just scattered around the place, in a mess of unstructured background. In a film, however, the scene is deliberately constructed and the environment is more "pure" - it is an stripped down set of meaning, focused. So the samurai sword mounted on the office wall and the red tie worn during the business conversation evokes by association additional meaning about and for the scene. Rather than just aesthetic beauty, we also create a conceptual structure which can have its own elegance. That kind of thing!

POST: Symbolic vs literal storytelling and defense of american style (/r/TrueFilm/)

Actual phenomenas outside the mind are much more interesting for some reason.

I've never actually encountered a phenomenon outside the mind, and neither have you...

Philosophical retorts aside though, movies in general face the problem of meaning. Having it, conveying it. And to tackle this efficiently, they of course must connect to our own experiences - to "real life". But this does not correspond to being "realistic" in the sense that you seem to mean it. When you wander about your daily, "realistic" life, you encounter all sorts of objects and circumstances which do not just represent, but are literally experienced as a network of knowledge. Decades worth of accumulated context are directly felt in each encounter, whether that's while on safari or during an exchange at the coffee counter. A film doesn't have the time to create "the memories you and I take for granted" from scratch. The format lacks the ability to build up those extended patterns. So it taps into pre-existing ones directly. Fortunately, our culture already contains, and imprints its participants with, vast interrelated "networks of meaning* - and all films call upon this. The so-called "realistic point of view" you see in American sci-fi is heavily dependent on this; every romantic comedy uses it; and the film-making process in general relies upon lots of techniques derived from it. See for example: the 500 Days of Summer palette theory, or the quadrant system in Drive. These are levels of symbolism also. Symbols are "sensory inputs which trigger extended patterns of meaning". Colours, geometric arrangements, outlines, shapes, objects, houses, spiders. Real life is symbolic, and all films reflect that to a greater or lesser degree. Any realism/symbolism divide that you draw is in fact arbitrary. What does this "mean"? It means that the spider in Enemy is in fact a real spider. As real as any spider you've ever encountered. It's just that for your entire life so far, you've been misunderstanding what "spiders" actually are.

You say this but then the rest of your post is philosophical! :D

Yes indeed. That was my little trick I played, I suppose. :-)

I won't labour the point because we're drifting from film discussion to the nature of experiencing here, but since film is basically all about producing experiences, let's explore it a little bit... EDIT: I did labour the point, after all. I would strongly assert that all onscreen images and real life encounters are pointers to, or activators of, emotional and mental states - as part of larger patterns. I'd disagree there is a fundamental difference between physical-literal and symbolic. The difference is merely one of personal historical encounters. We might tell ourselves a story about light and retinas and visual cortexes - it's our current narrative about "what happens", although one that has changed constantly over the decades - but that's really not our actual experience. (What were people's lives like, before brains and photons were discovered?) What we

experience are images, sounds, textures, emotions, and "felt-meaning" arising in a sort of "open perceptual mind-space". When I see an apple, I don't see a "round red shape with a bit on top". I really do perceive an apple. A complete sense of appleness appears in my "mind-space" with all its implications and meanings and context immediately present. If I'd had a terrible apple-related bullying incident as a child, the "colour" or felt-knowing of that incident would arise too. In a very real way, when I see an apple I experience the whole world and my entire history through the context of that apple. When onscreen, two men shake hands, is that literal? Literally two five-fingered objects temporarily intersecting? When the uncaring lawyer always wears a bright red tie and the edges of his eyebrows are slightly upturned, is that literal? Literally just a red tie and unkempt eyebrows? Or does it trigger a larger pattern that tells you something about his character?

Now, I know what you mean really. You mean something like:

- "Could I see the actual image displayed onscreen, with my own everyday eyes, while walking along the street someday?"

And your own mental filter doesn't really like things that stray too far from this. That might be an interesting to explore, personally, actually. I wonder whether, when you watch films, you are a person who thinks-about what they are seeing as they watch it - verbally assesses it and works it out - or a person who experiences it via the felt-sense that it triggers within you. The former tends to prevent a direct experience of the extended meaning, I find. If you are literally thinking the words "ah that's a spider representing a woman's power and the entanglement of influence over all areas of life" rather than directly-feeling it, then obviously it kinda reduces and ruins it, and makes it into a reflective experience rather than an immersive one.

I also liked the spider over the cityscape as it reminds me a feeling / "vision" I have of my own...

That phrase "feeling/vision", the experience that comes with that for you, likely encapsulates exactly the sort of thing I am talking about, I'd say.

What i would argue is that it would be inefficient for the brain to activate all those associative neurons every time you see an apple.

I'd say that the brain is "dumb" and it doesn't activate or create anything intentionally. It doesn't "do" anything. What happens is more in the manner of a passive pattern completion: a part of an pattern is stimulated and the extended pattern is correspondingly activated, but to diminishing extents as distance increases. In effect, every stimulus activates the entire brain as one pattern, but the level of activation varies proportionally. A metaphor for this might be dropping a tank of water on a mountainous landscape, which very rapidly flows across the landscape. The volume of water represents the intensity of activation of that part of the landscape. A short moment after the task is dropped, we see the distribution: intense activation at the drop point, and diminishing activation along the pathways leading away from that point. Note: the landscape doesn't "do" anything to activate those pathways; it is simply there. (Extra bit: every time water passes along a path, the path is deepened and so becomes more likely to be activated in future.)

It has to work this way, because otherwise there would be no such thing as an apple. Think about it: when you see an apple, a "circular red shape with a bit on top", why do you perceive an apple? What exactly is an apple? (Hint: it's not "out there" in the same form as it is perceived.)

I suggest that an "apple", like any object, is a collection of all previous image impressions from all possible angles which have become part of the same extended pattern. "Apples" aren't things at all. An "apple" is just a massive set of dumb patterns which have become intensely associated with one another, along with the pattern "A - P - P - L - E". So you're right: the brain doesn't create a whole new apple that is unrelated to the apple in the world. It doesn't need to. Because the only apple there ever is, is the "apple pattern" in the brain. And the same applies, therefore, to "the world". Which loops back to me saying earlier:

- "I've never actually encountered a phenomenon outside the mind, and neither have you..."

If this wasn't the case, then film as an art form wouldn't work.

Sometimes, you just don't get a movie when you watch it.

Yeah, agreed and this and also the retroactive re-contextualisng that can happen. I find this very interesting. Don't you think that the more "symbolic" a film is - the more abstract it is in at least some of its patterning - the more flexible and meaningful and applicable it can become?

I don't necessarily mean spider-wives in that case. I just think that films which provide you with a new abstract relationship which becomes overlaid like a template over your life in the week which follows, and so makes new sense of it. It's as if you'd never really thought about the idea of, say, a triangle before. You see a film in which the characters and objects are often arranged in a triangular relationship onscreen, with positions in the triangle corresponding to particular properties. For days afterwards, you notice things in the everyday world being arranged in that way, and discern meanings that you hadn't noticed before, which in turn update your interpretation of the film retroactively.

The Philosophy Section

Photons and so on are basically invented concepts - what one might call "connective fictions" to link our observations together. All that you ever actually experience are those observations (consisting of the experiencing of image, sound, texture, feeling). You might choose to infer that such things exist in some sense prior to experience, but it's not in a sense that you ever actually experience. Really, that "world beyond experience" is just a thought you are having - inside experience. The same, in fact, applies to the idea of brains as the "doers" of experience. Truly, you never experience being or using a brain at all. Any brains you observe always arise as images-sounds-textures inside experience. This goes back to George Berkeley and his Three Dialogues, where he says that all experience arise in mind and that the concept of a "solid, external substrate" which lies behind experience is just that: a concept. We simply confuse the stability of experience with there being an external foundation that persists beyond it. There is no evidence of such a thing. Patterns of experience do not, in fact, require substrates as an (unfalsifiable) explanation. More recently, we have fallen into the habit of viewing our theoretical abstractions as "real", often treating them as being more real, more "primary", than direct experience. Popular science publications have always done this, but over the last 30-50 years actual physicists, as they dismiss philosophy and assert models as "true", have made the same mistake. Physicist N. David Mermin wrote an good article about that here.

The Film Section

It's fascinating, that film can do that - change the meaning of the world for us - isn't it? And it's not that we have to actually think about the film for this to happen. The film just does leave an imprint on us, and the world appears differently, automatically, as a result of this. It makes film a very powerful thing, beyond simply entertainment or even being art. You can actually stimulate the effect in your daily life directly, without watching anything, but that's drifting a bit off-topic really. Well, your original post turned out to be quite thought-provoking eh!

POST: Can we formulate panpsychism such that it doesn't sound completely ridiculous? (/r/philosophy/)

[POST]

EDIT: This certainly got away from me. I was hoping to keep it short, but I also tried to cover a lot of ground. The result is that it is not as short as I'd like it to be, nor as detailed as I wanted it to be. I'd appreciate any responses. Thanks very much.

EDIT 2: I should be more clear about my project here. I'm not even really endorsing panpsychism (or if you prefer, panprotopsychism). I'm pointing out the reasons why it has some appeal, and then defending it against a particular objection: namely, that it is ridiculous to think that fundamental particles could have full-blown conscious experiences. I will (quite briefly) argue that we can.

Panpsychism, for those who are not familiar, is the view that all matter is mental in its fundamental character. There is something mental, phenomenal, or experiential about all matter-- right down to the electron. It sounds like a bizarre view, but it has some appeal and is gaining traction.

For those of us who are convinced that there is a Hard Problem in explaining how conscious experience can arise from a physical system, the doctrine of panpsychism offers a way out.¹ If panpsychism is true, we know where consciousness comes from: it comes from the mental or proto-mental properties of the matter which comprises it. Galen Strawson goes so far as to argue that if physicalism is true, then panpsychism must be true. That is, if the universe is comprised of nothing but physical matter, and consciousness exists in the universe, then physical matter must just be consciousness. consciousness must just be something physical. Otherwise, consciousness "emerges" from nothing at all-- a phenomenon sometimes called "radical" or "magical" emergence.²

Still, it seems like panpsychism solves one problem while raising others. How could something like an electron possibly be conscious? How could we even entertain the idea? Some may say that we must be pretty far afield of the truth to give panpsychism any credence at all.

But perhaps it's possible to characterize the mental content of matter in such a way that it does not sound completely ridiculous. In his Two Conceptions of the Physical, David Stoljar provides one possible avenue for exploring this possibility.³ According to Stoljar, there are two kinds of physical properties. There are t-physical properties, which are the sorts of properties which are explained by physical theory. If physical theory talks about a certain property, than that property is a t-physical property ("t" for theory). On the other hand there are o-physical properties, which are those properties of objects which comprise their intrinsic character. t-physical properties are grounded by, or have their basis in o-physical properties ("o" for object). In other words, o-physical properties describe the properties of the object which make it the kind of object that it is. The t-physical properties are those properties which explain why it's behavior is in accordance with physical theory.

There is an intuitive shift to be made from panpsychism to Stoljar's two conceptions of the physical. Perhaps those o-physical properties which describe the intrinsic character of an object are also the mental or proto-mental properties described by panpsychism. In that case, physical entities would be mental in their essential properties. And those mental properties would provide the basis for the way physical things behave as described by physical theory. As David Chalmers explains, this approach might kill two birds with one stone. On the one hand, it provides an explanation of the intrinsic properties which ground physical relations and dispositions. Physics tells us about the relationships between physical things, but not about an intrinsic character to ground those relational properties. Augmenting our definition of the physical with an essentially mental character might plausibly solve that problem. On the other hand, it provides a solution to the hard problem of consciousness. If matter is essentially mental, it is much easier to explain the mind arising from the brain.

To be sure, this still sounds like a strange metaphysical thesis. One might still object that it leaves us with a stranger metaphysics than that with which we started. We started with a Hard Problem, and now we're left with conscious electrons. Is that really an improvement?

To answer this question, we must explore the meaning of "consciousness" as it applies to an electron. Could an electron be said to hold beliefs, see colors, hear music, and so on? Certainly not. No one argues that electrons could have sophisticated experiences. But could they have any experience? It seems absurd that they could, but then, if they don't, what is so "essentially mental" about them? There are two possible problems the panpsychist faces at this juncture. The first is to attribute too much mentality to fundamental particles, which would be absurd. The second is to attribute no mentality at all to fundamental particles, in which case the assertion that electrons are "essentially mental" is empty and meaningless. Moreover, attributing any mentality whatsoever to an electron seems ridiculous, so it seems like the panpsychist must face one of these two absurdities.

Despite his predicament, I think the panpsychist has a way out. Consider the higher-order thought (HOT) account of consciousness. According to this account, a mental state is conscious by virtue of our having a higher-order thought about it. My sensory states are not therefore conscious-- they only pop into "the light of consciousness" when the spotlight of higher-thought comes to rest on them. I take this to be an independently plausible theory. Cognitive psychology has shown us time and time again that our conscious experience is much narrower than we often take it to be. This makes sense; as soon as we want to pay attention to something we shine the HOT spotlight on it, so to us it seems that everything is in the spotlight all the time. But that just isn't the case, as famous selective attention tests have shown.

I believe the HOT account of consciousness can save the panpsychist from absurdity. If electrons are somehow mental in their character, they can have a sensory mental character but lack a conscious mental character. Unlike us, they lack the sophisticated mental machinery to access their own intrinsic phenomenal character. Therefore, also unlike us, there is nothing it is like to be them. Despite the fact that there is something mental about them: namely, that they have phenomenal states.

One final bit of explanation. It might seem a bit ridiculous to attribute sensory states to an entity but not attribute to that entity any consciousness. But actually, I think we can sympathize a bit with the electron's lack of consciousness. I have often suddenly come to the realization that I have been having some experience without realizing it. For example, I will realize that I've had a song stuck in my head but not realized that I've been replying the lyrics over and over. Or I will realize that I've had a slight headache but not been thinking about it-- despite the fact that it has actually been bothering me, even when I didn't realize as such!

Perhaps these experiences are something like the existence of electrons under this formulation of panpsychism. They have some intrinsic phenomenal experience which provides the categorical grounds for their behavior, but they have no access whatsoever to that experience.

I hope that if nothing else, the links scattered throughout this brief exposition have provided some food for thought to those interested in the subject.

1 If you aren't convinced that there's a Hard Problem, panpsychism is likely to sound like utter nonsense, and reading on will certainly not convince you. Arguing for the existence of a Hard Problem is beyond the scope of this brief exposition.

2 A counterexample (employed by Strawson) is the property of liquidity. Although liquidity emerges from a system of molecules, it does not radically emerge. The property of liquidity can be explained by reference to the property of the constituent properties.

3 Stoljar does not endorse this interpretation of his view, but other philosophers have. David Chalmers, in particular, describes Stoljar's physicalism as a kind of panpsychism.

[END OF POST]

Thanks for the thought-provoking post.

I'm thinking: is the basic issue not just that of mixing up consciousness, conscious-of and self-consciousness?

Consciousness/of/self

An electron isn't conscious - rather it is consciousness. That's what it is made from, and everything else is too. All things therefore have being-awareness, the experience of being itself as itself. This is not the same as reflective consciousness.

From there, we have:

- Conscious-of: If there was patterned structure within the boundary of the electron, then the electron could be said to "experience" or be conscious of that structure. For a human, this means the sensations, perceptions, and thoughts which arise within themselves.
- Self-consciousness: This would be the ability for something to (incorrectly) identify with one part of the structure within its boundary and not another. This is what humans do: They identify with certain sensations, perceptions, thoughts (within themselves) and not others.

Within this, we would then go to more subtle structures, such as directed attention (often described as a "torch" but really better referred to as a "filter" perhaps).

The Blanket Metaphor

For this overall picture, I quite like the metaphor of a blanket of material whose only property is awareness. Laid out flat, the blanket would only experience being-aware. It wouldn't experience being aware of anything; it would just be "consciousness". It would have no perceivable boundary; it would have no characteristics at all. Until, that is, folds or ripples were made in the blanket. At this point, the blanket would be "conscious of" those patterns. Those folds and ripples would be its "world", as far as it was concerned. Patterns would change and shift and over "time" (measured as one shift relative to another) the world would become different. However, perhaps one part of the pattern would remain reasonably consistent or change very slowly. As the only consistent thing in its world, the blanket might incorrectly identify that part of the pattern as "itself" - confusing its knowing of being unchangingly simply being-aware with the persistence of one of the experiences, the content of its awareness. This would be "self-consciousness".

Worlds, Ripples and Nonlocality

I'd say the bit that comes after this, though, is the form in which facts-of-the-world are then present. The notion of a literal extended-in-space world that is "external" to localised peaks of consciousness starts to seem dubious. The world as experienced may be better described as a shaping or enfolded patterning of consciousness within that area. This would mean that the enfolded topology of a region of consciousness would be identical with its experience of the world (and basically would be the world, for that region). Furthermore, one's mode of thinking would deform the topology as much as sensory experiences would - one would to an extent literally experience one's beliefs. Referring to the blanket metaphor: In a sense, the "blanket" is simultaneously everywhere, only the "patterns" are located. The "blanket" is non-spatial and non-temporal; the whole world is therefore within it at every point. (Obviously this is trickier to imagine, because the picture we have of a blanket is spatially extended - however, we can see that it is all "blanket" and that "blanket" is everywhere and nowhere.)

Wow thank you for this. I have argued for exactly this for a while (and below) without realizing that the terms I use interchangeably and make sense in my mind because I understand it conceptually might be very confusing for people who think of consciousness in other terms. (I'm not the gold giver by the way).

I completely empathise - I've been wrestling with ages to get terms that make sense to more than just myself (consciousness, awareness, everything means different things to everyone). It's a painful process!

Turns out an excess sprinkling of hyphens and italics is the way forward! ;-)

Q: I like this formulation. A while ago, I had the realization that "this" (my personal experience) is what my brain actually "looks like" in the sense of what matter or the substance of the universe actually is. Ever since I've been trying to formulate it in a way that other people can understand without having had that personal experience. I'll try to see if this helps if you don't mind.

To start, strip yourself of all assumptions and truths you believe about the world. Reduce yourself to the most basic experience, and examine what it is that exists. It is clear that this, what you are experiencing, exists. There are qualia of different natures: colours, sounds, shapes... There is also a sensation of a sort of continuous stream of information feeling like it originates in the "center" of this experience, yet nowhere and everywhere at once. Examining the qualia, you can see most of them are static, except a few connected oblong shapes, whose movements seem to correspond some sensations in that continuous stream of information. Intuitively, it feels like commands are originating in this stream of information, commanding these oblongs to move. Let's call them the body. Commanding the feet (the bottommost oblongs) to move around seems to cause the entire field of qualia to change. However, there are some patterns to this change. For instance, an area of a certain colour may grow larger and larger, until it stops, the feet can't move anymore, and there is a new sensation at the point where the consistent area is closest to the body. We'll call that sensation touch. Moving the feet in a different way, you experience the consistent area of colour move sideways, until it disappears from your experience. Then, moving the feet a different way again, the consistent area of colour reappears. From examining your experience like this, a few things become clear after a while: There appears to be some sort of "things" which cause certain predetermined qualia to appear by affecting the body. For instance, the hands are stopped with "touch" at the exact point where the areas of consistent colour begin. You conclude that there must exist some "things", separate from your sphere of experience, acting their influences upon what exists as your personal experience. However, you cannot access the "thing" as it exists by itself. You can only access the influences the "thing" works on your sphere of experience. There appears to be a sort of "space" to move around in, but the body is always at the center of the experience. Further, you notice a lot of "things" are shaped very similarly to the body. And these things tend to move and create information very similar to the continuous stream of information. Through looking in mirrors and exchanging information with these things, you conclude that "the body" is also one of these "things". You conclude these "people" all must have spheres of experience centered at their bodies, with their own continuous stream of information. Hence, in their spheres of experience, they experience your body in the way you experience theirs: as a "thing" acting influences on their experiences. Further research leads you to know all people have an organ in their heads, and the nature of the activity in this organ, the brain, tends to correlate with the nature of the activity in their spheres of experience. You have come to believe in a kind of physicalism, that all that exists are these "things" you can describe through information gathered in your sphere of experience. Yet, the true nature of these things are inaccessible to you as anything but the reflections they cast in your personal experience. Just like the true mind of a person is inaccessible to you, except as this image of a grey lump transmitting electrochemical signals, as which their mind appears in your personal experience. Is there any reason to believe this gray lump is special in the domain of "things"?

Occam's razor tells us we should prefer an explanation of these spheres of experience which does not assume some sort of special intangible property assigning mind to these brains but not other matter. Is it not reasonable to assume that a "mind" is simply what a brain "looks like" when its existence is not seen as a reflection caused by sensory input into some other mind?

Just in the same way as there is an inaccessible property to other objects. Their "true" nature as objects in space: That which exists outside your personal experience and is the cause of you "seeing something" at an area in your experience. Is there really any reason to believe the "true nature" of a brain and a chair is fundamentally different? The brain contains and manages complex information whose true existence takes the form of complex qualia like "feelings" and "memories". However, the basic unit making up qualia, let's call it "consciousness", is just "what the mind is made of". Which is exactly the same as "what the chair is made of", only configured differently. Here's where IIT falls short. It is in a sense similar to this kind of panpsychism in the sense that it says mind is something that appears when matter is arranged in a sufficiently complex manner. However, it claims that matter fundamentally has a different sort of existence from mind. I.e., not only mind, but consciousness appears only when matter is arranged in a sufficiently complef manner. You cannot make one thing from another thing which has a fundamentally different kind of existence. IIT, as I understand it, claims as soon as matter reaches a certain treshold of complexity, 'pop', the kind of existence which we call consciousness appears. Panpsychism on the other hand would claim "consciousness" is the intrinsic nature of matter, and that complex phenomena like "feelings" are simply consciousness arranged to contain that information, the same way we can observe "experiential matter" to be arranged to encode information in our brains.

Good stuff. Working from direct experience onwards is definitely a key approach. Everything you experience exists as experience, and if you imagine turning off your senses, you find there is an open unstructured background to it. (I had a fun play with this in a post elsewhere. ["Why did the devs implement dreams?" /r/outside]) If you shift your perspective to this background (and it can be done, simply by deciding) then that sense of the world passing through you becomes prominent, and the nature of objects becomes clearer. You have to be careful when pondering this to stay 1st-person and not drift into 3rd-person thinking-about mode. That way you realise when you are supposing "external things as the source of experience" and so on. It's important to realise that we never have an experience outside this perspective, no matter what clever conceptual frameworks we come up with.

Is it not reasonable to assume that a "mind" is simply what a brain "looks like" when its existence is not seen as a reflection caused by sensory input into some other mind?

Or rather, that a "brain" is what a mind looks like, as an image?

If "awareness" is the fundamental property, and everything is patterns of that, then all reality has an experience of being-aware, of being itself. Sufficient complexity is what allows one part of a pattern to reflect upon itself, using patterns within itself. Meaning chairs and brains are indeed the same, fundamentally. Complexity doesn't change the nature of things, but it does allow more degrees of freedom.

Cristof Koch has in the past taken IIT and then adds to it that: "consciousness is fundamental". There's a recentish article by Koch on panpsychism here [<https://www.scientificamerican.com/article/is-consciousness-universal/>] which is worth a read.

It still doesn't get there though, because it still has a duality to it that you can't find in direct experience.

EDIT: Excuse the major extended rambling on my part. You're about to see how difficult this stuff is to put into language, and that when you do attempt, it usually sounds mystical and slightly nonsensical... Perhaps a bit of dialogue can clarify it though! Thanks for engaging in the discussion. If nothing else, it means I'm forced to try to describe it more clearly (or not).

Steps Along the Way

It might be confusing if you're using it to explain to someone who doesn't quite get the idea of panpsychism yet.

It's so often the case that we have to describe things "incorrectly" for a while until we're along the path a bit, at which point the context has shifted and we can reformulate that description. The "brains and images" concepts definitely fall into that category. And "standard panpsychism" itself is really a step along the way. It still assumes a fundamentally n-dimensional spatial-temporal world. But we leave that once we've established the "matter" of the matter, when we start to see the implications of a "single nonmaterial material".

I don't have the time to read the article by Koch this week or the next, but I liked that post of yours.

Personally, I wouldn't bother with the Koch article except for context, if you are already on-side with our discussion so far. But I feel obligated to include links like that in an "other opinions are available" way. :-)

this open field in which experiences unfold themselves, if I understand you correctly, would in the context of panpsychism represent the entire universe?

Right. Although to say "universe" is even too much, because "universe" would be patterned content. This is before that. But that' just a language thing - if we say that the term "universe" means "all patterned content" then the universe is entirely within and made of that open field, then we can put that aside.

Whirlpools Reviewed

I believe this is the separation between those who believe we all are fundamentally the same "I", or "God" if you will, and those who believe we are fundamentally separate "souls" (one blanket per person). . . I tend to be in the former camp

I believe we can join the two together, and solve most of the problems you pose. We've already done it, in fact, we just haven't realised it. The whirlpools metaphor is great, but it has the difficulty of being "spatial" so it only goes halfway. (The blanket metaphor is identical in this respect. The whirlpools really correspond to localised little circular folds within the blanket metaphor.)

It leaves us with our the experience of the body, mind and world (specifically: sensations, thoughts and perceptions) appearing within the perimeter of the whirlpool. But... where do they come from?

If every person were to be an individual whirlpool, how do we perceive one another at all? How does that information "cross the space" between whirlpools? What are the boundaries of the whirlpool?

The answer is to reconfigure the metaphor a little.

Perspectives and the Enfolded

To say the "world is within you" doesn't just mean that the present moment sensory experience is within you. It really does mean the whole world - all patterns everywhere - are within you right now and you are actually experiencing it at this moment. However, only one aspect of it is "unfolded" as senses; the rest is "enfolded" into the background, simultaneously everywhere.

Metaphors:

- During day time we see the sun shining in the sky, we do not see the stars. But the stars are still there, it is the brightness of the sun that conceals them. Just so, visuals and sounds and textures conceal the subtle global felt-sense in the background of experience. This global felt-sense is the entire universe, summarised.
- Imagine a stretch of unbounded water. Waves and patterns within it, your gross experience. Now, take some coloured dye and place a drop into the water. From the perspective of the water:
 - Spatially: The colour is simultaneously everywhere, while being nowhere.
 - Temporally: There is no record of a time when the colour was not there.
- To take on the ultimate perspective of awareness is to take on the perspective of the the colour rather than the patterns within or structure of the water.

So let's return to being-a-person. Language will cause us problems here, but we can get halfway.

You are not a person, you are a perspective. An area of awareness, made of awareness, but unbounded (because it is non-spatial and non-temporal). Within every perspective is everything, enfolded. Because everything is enfolded everywhere. Your present moment sensory experience is an unfolded aspect or pattern of the complete enfolded universe. Your felt-sense is your experience of that everywhere. If you think of yourself like this, as a "perspective" that is *tuned-into" a particular part of the overall pattern, then you can solve the other problems. If you release a hold on your present attention, you will find you relax and deepen as the unfolded aspect dissolves into the background of experience. The waves settle and you identify as the colour-that-is-everywhere, or the entire-sky (with both its stars = universe of all patterns, and its sun = present moment experience). Your present moment becomes unformatted, dimensionless, timeless.

The Overall Picture

The implications of this could be summarised thus:

- The only fundamental property is awareness or being-aware.
- The "universe" is all patterns in currently formed in awareness.
- A "person" is a "perspective" which has experience in the form of "unfolded" sensory experience and "enfolded" background experience.
- The "enfolded" background experience is actually the entirety of patterning everywhere. By which we mean "all existence" not just the post-big-bang universe we theorise in physics.
- All information is accessible to you, to be unfolded, because all information is everywhere, enfolded.
- Deep sleep or meditation corresponds to there being no unfolded content in your perspective.
- Death of the body just means those particular bodily sensations no longer appearing.
- True dissolving would mean the ending of the "perspective". But this cannot be comprehended, because the "perspective" is not spatially or temporally defined.
- Your absolute true nature is the true nature of everything: simply unpatterned being-aware.

Phew. That's my best attempt for now.

Q: Perhaps a bit of dialogue can clarify it though! Thanks for engaging in the discussion. If nothing else, it means I'm forced to try to describe it more clearly (or not). It's appreciated. It's difficult to find occasions to genuinely examine these perspectives with some attempts at logical rigour to make sure what you're saying is meaningful. Pretty much the only places I've found to discuss "mystical" matters are the psychonaut subs, and the environment there isn't very conducive to inquisitive rational analysis. In order to be avoid some confusion, I believe it's a good idea to introduce two terms. The transcendental "I" , the "spotlight self", and the "ego" (not the freudian one). Essentially, the "I" is the blanket, the "spotlight self" is the particular pattern, all the sensory and mental activity which makes up an individual mind, and the "ego" is a person's sense of being a separate acting agent. The difficult part of trying to think of everything as one consciousness is the question of "why am I experiencing 'me' then, and not someone else, or everyone else?". There's some intuitive perception that you're aware of everything within your consciousness. This can be helped somewhat with examples like the control of your breath, which clearly passes in and out of the spotlight self multiple times a day, demonstrating that what the average person thinks of as themselves is not a static thing, but rather a conglomerate of experiences changing in nature continuously. From there a better understanding of how a spotlight self is an occurance in a greater field of self might make more sense. Noone has any trouble understanding why a cup is not a different cup: they're different occurences in the spatial model people are familiar with. In the same way two "minds" are different occurences in the conscious model. I don't know if it's very clear to call it a perspective, because it's a very antropomorphic and spatial term. It might be better to say that these experiences are, and they exist fundamentally as consciousness, and when they exist within the conglomerate of experiences that is the spotlight self, they are experienced as a part of that loose collection of experiences. These collections contain basically only one constant component, which is the ego. The ego is the experience of other experiences being evaluated and manipulated, interacting, in this spotlight self. The ego is the individuality of a person, and what most people identify with. The point is that the source of the feeling of "me" as an individual, is the same as the source of the feelings that make up "my mind", meaning no one but "me" can experience "my mind". So if you clear your mind completely, you'll see that this ego was just another one of the experiences in this field of consciousness. Nothing fundamental. Just like what the ego thought was experiences happening to it. It's curious though, how it's always the same set of experiences that are unfolded. You don't go into deep sleep and wake up in a different room as a different person. And there's lots of different instances of such unfolding, each separate. It's really difficult to come to terms with how my mind is a perspective arising in this field because of how mind-bending it is. I guess the point is when you experience the whole of it, you don't experience the individual perspectives that occur in it. What's difficult is for me to reconcile is that in some sense when I enfold my spotlight self and try to experience the whole, in some sense it's still jonluw trying to experience the whole, nlt the whole itself, since jonluw can recall the experience. Jeez, this is difficult to write about. The Tao that can be named is not the real the Tao and all that.

Thanks, I think we can get somewhere here. So, if we talk about selves and so on we are still talking about partitioning the content of experience in some way. I basically say "this part of experience is me, the rest is not". The "ego" is our identification with one part of experience and not another part of experience. Why is your arm part of you, when the cup is not, for instance?

The distinction is surely arbitrary and is simply convention:

- We make the distinction based on spatial proximity. Perceptions that are near the point-of-view are assumed to be "me". In particular, bodily sensations are assumed to be "me" whereas visual perceptions not near the body sensation are assumed to be "not me".
- We make the dissociation based on temporal proximity. I intend my arm to move, it moves shortly afterwards. However, I might intend all sorts of things - passing thoughts - all the time that arise as experiences later. I don't say I caused them and they are part of me, though.
- Things that seems to persist we identify as "me", things that are fast changing we see as "not me". For instance, body sensations and thought locations persist and

recur; the scene around us changes dramatically all the time as we "move about".

All of this, though, occurs in the same "open space". (Yes, "perspective" is an awkward word and I'm not all that keen on it. I mean it more in terms of "assuming a perspective" or "taking a point of view" in experience. Unfolding this rather than that.)

Obviously, when you let go of all content then you are not really a perspective anymore. A perspective is something you temporarily become.

So if you clear your mind completely, you'll see that this ego was just another one of the experiences in this field of consciousness. Nothing fundamental. Just like what the ego thought was experiences happening to it.

Right. All that is fundamental is the being-aware. None of the content is fundamental, whether it is being experienced unfolded or not. And by content we mean both the current experience, the background facts of "this world", the broader patterns of "all worlds in existence". If you let go too far, you stop being/having an experience completely and totally dissolve as an apparent separation in Awareness.

The point is that the source of the feeling of "me" as an individual, is the same as the source of the feelings that make up "my mind", meaning no one but "me" can experience "my mind".

Different "spaces' could have the identical experience, maybe? Not sure on this. You could "take on the perspective" of my position right now. But this would mean you'd also be taking on the present moment in its entirety, including memories. So you'd actually just become TriumphantGeorge.

It's curious though, how it's always the same set of experiences that are unfolded. You don't go into deep sleep and wake up in a different room as a different person. And there's lots of different instances of such unfolding, each separate.

Well, you don't know this, perhaps. There could be a complete discontinuity in the arising experience and you (as an open space) might be unaware of this.

e.g. The experience of being a Japanese Professor could be arising - experiencing from the perspective of a Japanese Professor - and the next step you are experiencing from the perspective of Jonluw typing at the computer. Unless a memory was available of the previous experience (i.e. there were traces of the Japanese Professor Walking experience in the Jonluw Typing experience), you would not know.

I guess the point is when you experience the whole of it, you don't experience the individual perspectives that occur in it. What's difficult is for me to reconcile is that in some sense when I enfold my spotlight self and try to experience the whole, in some sense it's still jonluw trying to experience the whole, nlt the whole itself, since jonluw can recall the experience.

Right!

For as long as you try to do this while holding onto a point of view you won't be able to. If you do release your hold on that point of view, however, this means when you re-adopt the perspective of Jonluw, you perhaps won't have the memory. If you let go of the Jonluw experience absolutely completely then you may reattach to another perspective. If you release too far, you may cease to be a partition at all?

The phrase "pure perceiver" might be a nice one to adopt for this discussion; it's the "most subtle perimeter". The three-dimensional camera, as it were.

See, I believe what we see as objects within each spotlight self experience, reflect some nature or behaviour of the field of consciousness.

Right. That we see consistencies simply means there are persistent generalised patterns, though. This is not to be dismissed; they are the channels along which the experience of "this world" forms, and while we are in that context then this is quite important!

It means the world isn't subject to eternal, independent laws; it does mean that generalised regularities can be seen as incorporated within consciousness in the same way as the actual experiences.

Basically, I think the entire physical sciences are a very advanced form of the blanket metaphor.

Yes, the blanket metaphor says "there's the fundamental" and then "everything else is folds". Anything we observe or become corresponds to such pattern. The generalised regularities of science (as noted above) are such patterns.

So even though it's one continuous blanket, I can still identify and describe with physics, one relatively simple fold and one ludicrously complex fold.

Right. Physics, say, is an accounting of a particular subset of folds. (And also, as a subject and mode of thinking, takes the form of a subset of folds.)

Scramble these nerves, and there would be no jonluw. There'd still be a transcendental I, but the experience of jonluw would not be manifested in it.

Transcendental I (the blanket/property), pure perciever, perspective-of-jonluw, ego of jonlaw.

This is important because what we can see in our physical model reflects what is going on in the world of actual existence, consciousness.

Only a particular, greatly-reduced subset. And we have to be careful and not assign the human experience to other aspects. For instance, cups experience being cups, they don't experience "sadness". "Sadness" is a sensation in the body linked to various other perceptions and thoughts. Cups don't have thoughts and feelings. They have... ceramic. Cups aren't even "cups" as we conceptualise-experience them.

It is, however, easy to say something is spatially separated in the physical model. Not so much in the field of consciousness.

Right, although things are separated out in the physical model, they are not separated out even in experience or apparent reality, if you truly investigate it. Nothing is spatially separated, fundamentally. But when we think of things, we are forced to imagine them in some sort of extended space, in metaphor and in daily life.

For jonluw to experience what "you" are seeing as well as what "he" is seeing, the two sets of experiences would have to be arranged into one set. In the physical model, the brains would need to be connected with some seamless form of communication.

However, this is possible I think - having simultaneous experiences. And I don't think it requires literal brain connection. Remember, our "pure perceiving" isn't actually bound to brains or any particular structure.

However, with the help of the physical model we can see that consciousness arranges itself into complex structures, where "sound" only exists as a structure within that structure.

In fact, by adopting the physical model as the structure of you perception/mind, you directly experience this physical model as if stable and underlying. If you let go of that, it stops being unfolded in that manner and you have the raw being experience. Or, it has you...

A problem arises: You can't separate out the "physical model" from your patterned perception of "the world". And changing your physical model changes what you perceive. Effectively, your world is the structure of your mind. This is before brains.

There's something else to cover here: Fundamentally, there is only the property of being-aware. Within that, patterns appear.

Immediately when we imagine this we are incorrect: we will tend to think of the patterns as spatially extended or interrelated, but this not the case. (Space in fact would be one such pattern, which might from the structure from which other patterns borrow.)

There are no limits on the form those patterns, although we cannot think of this. And there are no rules, inherently. Only temporary regularities. To describe a particular arrangement requires a language that corresponds to it for the duration that it persists. Our physics codifies a certain subset of patterns (patterns of perception which exist as regularities in mind, persisting in memory, tied together within conceptual framework which also exists as regularities mind, persisting in memory, in a mutually-reinforcing

relationship). Because it involves a shaping of mind and perception, it seems obviously true that we are describing an external, dependable world. But we are not. **The world is not external, it is internal.** However, the shifts in language required to describe one aspect of experience deny us the ability to describe - and even have - alternative experiences. We need to kill one point of view to shift to another.

...

Hi, thanks for taking an interest and joining in. Just going to bash out a quick ramble here for now to keep things going. Some of the disconnect here might be that it is reaching for terminology to describe a foundation that is not itself an object - it is simply a property, something we'd come to - but can "entertain" objects.

You can build any number of complex, internally consistent, frameworks to defend any number of views, but there must be some basis for believing one over another, correct?

Yes, and this is exactly about anchoring a framework in that way.

So, why is the idea of a pure-perceiver relevant?

The source of this is an effort to connect the description of consciousness with the facts of direct experience. Rather than, say, just connecting it to another accepted framework, as is more common in this area. Hence the earlier hyphenations of conscious-of and so on.

After exploring this (our direct experience), we end up identifying a basic experience which does not have a boundary, but has content appearing within it, with no discernible "outside" form which it comes. Further investigation reveals a non-gross background felt-sense which encapsulates the whole experience and can be to some extent "unfolded".

There is no sense in which there is a "thing" experiencing the content of experience.

The felt-sense and next-step corresponds to a variation on Eugene Gendlin's philosophy and psychology efforts; the enfolded-unfolded to David Bohm's implicate-explicate order model as described in Wholeness and the Implicate Order.

i.e. The concept of the "pure-perceiver" arises from the need to have a borderless context for subjective experience. The notion of enfolded meaning/facts is to provide a link between the structure of subjective experience (the behaviour of the context, the current moment, and the felt-sense) and an objective or 3rd-person description of the world (time, space, objects, etc).

I guess this comes back to my previous response to you, why is it that "Within every perspective is everything, enfolded"?

The short answer would be, there is nowhere else for it (the content of the world) to be. On the enfolded thing, it's in the following sense that the world is dissolved within the pure-perceiver:

[Imagine a device that] consists of two concentric glass cylinders. Between them is a viscous fluid, such as glycerin. If a drop of insoluble ink is placed in the glycerin and the outer cylinder is turned slowly, the drop of dye will be drawn out into a thread. Eventually the thread gets so diffused it cannot be seen. At that moment there seems to be no order present at all. Yet if you slowly turn the cylinder backward, the glycerin draws back into its original form, and suddenly the ink drop is visible again. The ink had been enfolded into the glycerin, and it was unfolded again by the reverse turning.
-- Wholeness and the Implicate Order, David Bohm

TL;DR: The "pure-perceiver" is fundamental and is the non-thing whose only property is awareness or being-aware, which means that it "is" awareness.

what do you think of the idea that there is one experiencing subject, entertaining multiple, simultaneous self-contained experiences? This idea is in a way the opposite of Parfit's resolution to paradoxes of personal identity. Instead of there being no enduring persons, there is one subject, this "blanket". Instead of never stepping in the same river twice, persons endure simply because the conscious property of the universe endures.

That's pretty much where I'm going with that.

There is only the blanket - the infinite nonmaterial material whose only property is being-aware - and transient patterns forming with it. There can be multiple, apparently self-contained experiences - shallower patterns within the perimeter of deeper patterns - and any number of them.

Remember, though, that nothing is really separate. Any pattern can be said not just to be made of blanket, but to be "blanket". This is simultaneously everywhere, all-at-once. So in that sense, all patterns are available from within all other patterns if you drop down and quieten yourself to "blanket" level.

Being a "person" could be to be your own localised experiential world. However, you would also be all other localised worlds and the non-spatial, non-temporal background. However, given the subtle structure we might call "perspective", we tend to focus on the immediate large clumpy sub-.patterns. If we completely let go of that though, "our" experience could expand to encompass it all.

Our present moment is experience is just what we have unfolded right now. One enduring property is all there is?

So it's more like the one property that's guaranteed to endure during survival.

Of course. I don't mean it's all there is right now - but it's the "basic thing that never goes way" so it's all there truly is. Which is reassuring because it changes our relationship to "stuff".

If what we truly are a subtle "perspective" - needn't be annihilated if all the patterns of this world dissolve. Although we would cease to be this "person" perhaps.

I'm not sure what "transhuman technology" would mean given that context though.

...

This leaves us with the question: what the fuck is it like to be an electron?

What is it like to be a human arm?

On the electron: If you could transfer and localise your attention and somehow become just the electron for a while then return, you would never be able to describe it. All your concepts are human-experience-based.

What is it like to be a human in deep sleep? You do that every night. Try to describe the experience.

Fucking electrons.

"What is it like to be a human arm?" : Absolutely nothing: minds are conscious, and the human mind is the human brain. What is it like to be a human brain? Well, it's what I'm doing right now! So the answer is: quite complicated, actually... "What is it like to be a human in deep sleep? You do that every night. Try to describe the experience.": Fuzzy, still, fluid, lukewarm. (Also, sleep is unconscious. You're not supposed to be conscious when you're asleep.)

Why are brains conscious and not arms? Is your arm inside your brain? When you are asleep, do you stop being a "mind"?

If sleep is supposed to be unconscious, what about dreams and lucid dreams?

Is it more accurate to say that deep sleep involves a ceasing of there being something to be conscious-of rather than a ceasing of consciousness.

Now you're just shifting the definition of "consciousness" so that you keep panpsychism while leaving behind the original evidence and intuitions that helped you get to panpsychism in the first place.

Actually, you are right to some extent. But the wrong way around. Everyday panpsychism leads you to a perspective which forces you to kick away the basis of the original view, it having done its job. This is because you end up recognising that panpsychism's flaw is the assumption of a spatially-extended world. But you can't do this from the beginning.

However, I am careful in my definitions. That's where the whole consciousness vs conscious-of vs self-consciousness thing comes from. Remember, I am not OP.

...

A1: Ladies and Gentleman, the Chess Metaphor (not invented by me): A very experienced chess player, is playing a game of chess with himself. No chess set is at hand, so he plays the game "in his head". This mental chess game can serve as a model of a (very tiny) panpsychic universe. It's panpsychic, because its ultimate foundation is the player's consciousness. It's also a model of a universe, with space (chessboard), matter (pieces), time (moves), and physical laws (rules of the game). In this model, there's just one fundamental consciousness, but we could imagine that being divided among non-fundamental consciousnesses: the roles of white player and black player; a pawn "trying" to get promoted; any "theme" in the game which is engaging the attention of the player. We don't need to insist, that every object we can name is conscious.

Right, nice metaphor - differentiate between made of consciousness vs one part being conscious-of another part.

Every object has being-aware - it is what it is as it is - but that is not the same as self-consciousness and being able to take a stand as one part (chess piece) in order to manipulate another part. The human player has the whole chess board within him. An individual chess piece just has wood grain within him.

I question whether panpsychism does any of the work we want an answer to the Hard Problem to be doing. "What is consciousness"? "Consciousness is an intrinsic property of everything". Well...ok? Isn't this just an updated version of the homonculous, one of these infinite turtle regresses?

No, it skips that - it says that consciousness is the material from which everything is made. This doesn't mean everything is self-conscious though.

Whereas "matter" at a fundamental material has no intrinsic properties at all, "consciousness" as a fundamental material has the of "awareness".

It basically means you don't need to magic-up consciousness as mysteriously "emerging" at some stage of complexity. (What complexity allows is self-consciousness, of a particular structure being able to represent itself by having an "idea" inside itself. One part looking at another. This is what we casually just call "consciousness" usually, which is half the confusion.)

TriumphantGeorge Compendium - Part 30

POST: David Chalmers' TED talk on "How do you explain consciousness?" (/r/philosophy/)

I think the "inner movie" idea is a poor metaphor, even for a general audience like this, since it inevitably implies "content" and a "viewer of content".

The subjective experience is more like being an aware material which "takes on the shape" of experience, and therefore all experiences are you experiencing yourself. It is in this way that "consciousness" is fundamental. Self-consciousness is something else: It is the identification with one part of experience as "you" and the rest as "other", from an expanded perspective containing both. In moments of no content (perhaps in deep meditation and the like), there is simply the experience of being-aware without objects or a "you".

I think the inner movie idea is a good conversation starters for people who haven't really considered the idea of consciousness and that this bad explanation actually opens the door to your better explanation.

There's something in this - stages of explanation, where each new layer begins with revealing the previous one as false - actually. Start with the movie explanation, then say you are the movie screen and the image, and then that they are one and the same.

Depends what concepts and culture the person is familiar with. Problem is, though, that these halfway islands of explanation become the habitual way of describing something, with the next more-fiddly stage neglected.

Q1: One would be better to trust their consciousness as real and true as oppose to any scientific theory which is simply a byproduct of the consciousness. Is there a reason you single out scientific theories here? It seems like you should reject philosophical theories as well?

Q2: It sounds like a solipsistic notion to me. If I had to guess I would say that his/her position is that only one's own consciousness can be sure to exist. Scientific and philosophical theories as well as everything else cannot be objectively proved to even exist let alone trusted. The problem with this argument is that it is unfalsifiable. That is supposed to be the mark of a weak argument as Christopher Hitchens would say.

Problem is, perhaps, that something that is completely true might be unfalsifiable - e.g. Everything is consciousness / everything is my consciousness.

"Everything is made from matter" would be vulnerable to the same thing surely?

Saying "everything is made of matter" can be verified through experiment

I'm not sure it can, though? It's equivalent to saying "everything is made of stuff, the stuff that all experiments detect"?

I follow the argument. What I was getting at is that the statement "everything is [made of] consciousness" basically predicts everything exactly as it is observed, including subjective experience. So -

Perhaps a better judge of it isn't whether it is falsifiable, because "correctness" is built in in a sense, but whether it leads to a more coherent or intuitive framework than the alternative. (e.g. Not needing to fall back on the hope for "emergence", etc.)

Well the claim "everything is made of matter" is not perfect, but you could see if you were say something a little more specific...

It could only be made more specific by assuming a certain subset of matter, I think. Which means you'd be testing the properties of a particular instance of matter, rather than matter itself. The same I think applies to "consciousness", except "consciousness" has the property of being-aware.

How does that statement predict everything as it is observed? what exactly does "everything is made of consciousness" mean?

The quick way to suggest this would be:

- Consciousness is a "material" whose only property is awareness or being-aware.
- All things are patterns in and of this "material".
- Therefore all things are have being.
- This does not mean they are self-aware, in the sense of being able to reflect upon themselves or think or whatever.

In truth, it's basically materialism but with the property of fundamental being-aware inserted into the lowest level. If that makes sense. You get all the same "objective" observations, but you also get subjective "being", the ability to be *conscious-of, built-in with no need for emergence.

Experiments also detect space, time, energy, and information.

They don't detect those things in depend of matter. But you get my point, don't you? That the "unfalsifiable" has limit potentially when it comes to discerning the truth.

I can clearly feel myself existing within my body, it feels like my skull is a house and my eyes are windows and there is an entity (me) that is in the house.

Which is interesting, because it can't be true. In what sense are "you" housed inside the skull?

In the sense that "I" am not outside of my skull ??? :/

Surely that's not your actual experience though?

So, light may go in your eyes and then travel along your visual cortex where the signals are interpreted and contribute to a "3d world" that you then perceive yourself to be in - but that whole representation is inside your skull. As in, the room around you is all inside your perceptual space - it's all "you". If you try and find the boundary between 'inside' and 'outside' right now, you'll find there's no barrier in perception - you don't feel a wall between the room and you, do you?

You imagine being inside a skull, but that's not your actual experience I'd suggest. (Hopefully that made some sort of sense.)

Top tip: Point to your "real" hand. If you are pointing to one of your hands that you can see, remember that that's inside your skull; it can't be your real hand. If you are pointing to your head, then the same applies: where is your real head? (Answer: If it exists at all, then it is completely outside this perceptual space.)

This is definitely an informative area to explore I reckon...

Ok in that sense, yes my mind is everywhere. but finally I have to logically say...

Thing is, it is a jump, because you never experience that outer world. Indeed, you never really experience a "self" other than a thought of one. You suppose your brain is making all of the external observations (and 3rd-person experiment suggest there is a correlation between brain areas and subjective content) but the fundamental background perceptual space itself cannot easily be accounted for in this way.

It is not clear in what way that 3d experience is inside your skull; when we look inside we do not see a room, for instance.

it's the difference between a movie and the watcher.

What is the "movie" and what is the "watcher" in that metaphor?

I suggest that upon examining your subjective experience, you will not be able to find a "watcher". If you think you do, then examine it further and you will discover you are perceiving it from outside of it - meaning it can't actually be the watcher of course.

... the only thing left will be "you". I like to call this observing entity the soul, at the moment most people are calling it the consciousness.

Right, the unbounded aware openness. I'd say most people are using "consciousness" to mean something a bit different, like the content or a notion of self, rather than this fundamental background. Which is why things get confused I reckon.

I cannot isolate the location of the soul...

Because it is what the experience is made from. Investigate any sensation or thought and you discover it is that too. Hear a sound in the distance, you discover you are both "over here" listening to the sound and you are "over there" beside the sound. It has no location, because it is the unbounded aware space in which experience arises, which is you.

But yes this is an informative area to explore, although I understand that my metaphysical ideas are way out there,

Not at all - they follow naturally from a direct, experiential exploration of this stuff, rather than just thinking-about. If you conceptualise it as a space which takes on the shape of experience, including sensations, perceptions and thoughts, then you don't need to deal with the duality of experience and experiencer.

... my body would be doing all of the typing all by itself without any sort of conscious awareness like a robot.

Well, your body and thoughts and the world around you all seem to arise as spontaneous experiences, "by themselves". If you examine closely the way in which you "direct" these things, you will find you cannot locate the "doing" of them - only the experiencing of them. After all, when your attention becomes absorbed in the words onscreen, your heart doesn't stop beating. Hopefully.

conscious awareness

Perhaps better to say conscious-of or attention-on for this usage, since it is a particular shape of experience adopted by the background awareness.

Right now, isn't seeing just happening all by itself? And when you type, isn't most of that happening by itself? Only if you have over-focused your attention or if you have tensed up do you feel "effortful doing", I'd suggest.

But that's the thing, there cannot be an experience without an experiencer.

Ah, we're only slightly disagreeing. I'm saying that there is only "the experience", by which I mean that you experience something by being it. Your awareness "takes on the shape of" an experience you are having. The apparent separation is a language thing. This actually plays to your "trees in the wood" thing. I'd suggest something extra, which gets around Berkeley's "God is experiencing everything and so keeps it existent" thing. That is, that you are experiencing the whole world right now, it's just that you are only experiencing part of it as a sensory experience. There rest of it is dissolved into the background, as it were.

The facts-of-the-world are here right now. When you walk into those woods are see the fallen tree, you are "unpacking" the tree from the background and into perception.

through meditation I control my emotions and eventually my heart rate.

Right, it is all potentially accessible; you can unpack any part of the background (that which is not within current attention) and make it so, with a bit of practice and (importantly, of otherwise you block the route) belief.

he truth is whenever I think a lot I can feel my brain getting denser like as though I'm flexing a muscle so yes I do feel a little effortful when thinking.

Is this not different?

There is a difference between making thoughts and thoughts arising, in response to an intention. Effortful thinking brings tension, because it involves a suppression and redirection, due to misunderstanding. You feel a pain because you are implicitly tensing up muscles in an attempt to control what arises. Although also, I think you can experience pain wherever there is "stuff that shouldn't be happening".

I then realized that I do in fact "exist" as an entity that was experiencing this depression and that I was running the boat that is my body. Through constant pessimism I had corrupted my boat to the point that it negatively affected the conscious observer (me).

You do exists as an "awareness in which experience arises". And if you screw up the spontaneous flow, block up those patterns, I think you can get into deep depression mode. Basically, you end up creating persistent structures that prevent movement.

An approach to thinking of this:

- Experiences leave traces which "in-form" subsequent experiences.
- Thoughts are also experiences, and effortfully generating or allowing thoughts is equivalent to experiences them as events.
- Hence both bad situation and bad thinking will funnel your future experiences in that direction.
- It is possible to almost completely halt the natural flow of experience by doing this.
- The natural state is one of open allowing, with no trace accumulation. This implies that one should let thinking and action arise spontaneously, and direct your experience only indirectly - through intention.

Pessimism is (accidental) active programming of experience. Unfortunately, this means that to improve you have to choose to think and act in a positive manner - completely ignoring the evidence of the moment!

I do agree that there is a difference in our language, of course the experience and the "experiencer" are one and the same, I just meant that there is an entity within which all of these experiences are experienced. It's more of a ying yang, inner-outer world idea based on compatibilism, the soul does not have any solid boundary, the experience can go as far as the thought wants to go (this is where we might talk of auras). But finally all of this is experienced by a single central awareness which you can call as a soul.

Right. Unbounded. It's all 'within the aware perspective' I'd say.

If you try to find where "you" are, you'll discover you seem to be everywhere, and that the world experiences arises within you. I think this flipping around or inverting of our usual way of approaching the world is quite key to having a direct understanding of consciousness.

do you perhaps believe in the immaterial soul ?

Not that's how I would describe it, but the broader idea, yes. We are "whatever is aware" and, not inside a skull, but rather "tuned into" an experience. It also not at all how clear how much of that experience is external to us. Now, there may well be philosophical zombies - not all "people" have consciousnesses looking through them, perhaps - but I certainly am not. :-)

How on earth could you possibly to say that ? are you looking at blackness ? consciousness isn't looking "through you", you ARE consciousness. I'm sorry but I couldn't really comprehend what that meant, how could we be talking if you are not a consciousness ? What I mean is that a philosophical zombie can be artificially programmed to perfectly behave like a human but there is nothing inside the zombie looking back out the way you are looking back out at the screen.

I am consciousness, and the experiences I have appear within me. I am not "inside a body". I am having the experience of being a body. A philosophical zombie could potentially behave exactly as a human, without a consciousness being aware of it, if that makes sense. It's not about programming. To cut to it: Do you believe that the "soul is in control" at all times? Do we finely manipulate our behaviour? Or are we mostly aware of it, with certain adjustments now and again?

The word here my friend is compatibilism, The unified soul can be divided into the conscious awareness and the emotional subconscious (ying.yang), the conscious awareness is completely free to do whatever it may but the subconscious is extremely deterministic. The subconscious consists of these instincts that are in tune with the best approach in the chaotic world, this can be described as the brain activity that occurs before the person becomes consciously aware of it. It would really benefit the free will listen to this subconscious but free will is also the source of critical thinking and reasoning, the free will can freely choose to listen to the subconscious and access the different possibilities the subconscious has to offer or it can ignore it completely. But because it would benefit to listen to the subconscious we can track the subconscious on monitors and predict the outcome of the persons choice before he becomes aware of it. The choices that the free will makes also affect the subconscious which could later determine how future decisions are made. The subconscious can be described as all of the experiences inside and outside of your mind, it is everywhere and limitless, however the conscious free will being the source of this consciousness should technically exist inside of your brain.

Yep, good summary! We can go into further details about the nature of the encompassing awareness, etc, but overall there, is after all, you-and-your-preferences + the world experience. There is no "free-beyond-this" will.

I have created this really crazy theory that shows that there is a subtle conscious force that permeates through the universe and this force is responsible for the creation and sustenance of life. Literally everything is consciousness ! The whole universe is an ocean of this energy and our awareness is like a whirlpool in this ocean.

There is a nonmaterial material whose only property is being-aware. Everything is patterns within this "awareness"; individuals are semi-localised areas in which their world appears. However, at a fundamental level, everything is everywhere and always, like the colour "blue" is the whole ocean, because at root there is no time or space division.

I feel like as though my mind is pouring out of my eyes and is enveloping everything around me, but at the same time the world is entering inside me.

Right, well I'd phrase this as that you are the background, so therefore awareness is everywhere (and all experience is made from awareness), and the apparent world arises within it.

chakras

Although I'm familiar with chakras generally, I'm not really up on them being applied specifically. I guess I find it difficult to link their "physical" side with the less structured background idea.

The etheric feild interacts with the soul...

So, in this way, what is the "soul"? Or are we just talking about different 'types of pattern' within, and of, me? Is "energy" really just a movement, a shifting of patterns in consciousness then?

there is not a single part that isn't you really.

What are the implications of that?

This is where things seem even more far fetched for you, I used to be an atheist myself, but atheism never really answered any meaningful questions, it was only a an idea of rebellion and nothing more. I used spirituality aided by my critical reasoning to help me get through my depression and it genuinely worked. Believe or not, but through spirituality I have left my body twice and now have a little command over the movement of the wind by tuning by body and mind with the consciousness of the wind. (yes I said I can move the wind, believe me if you want but I am having a lot of fun with my aerokinesis)

Aerokinesis is a great word. :-)

I am an atheist in terms of an entity god. I am not religious. I am aware that all my experiences arise in a space of open awareness (consciousness) and is shaped from them. The best description is perhaps, that I am God taking on the shape or perspective of being-Triumphant-George. I am still everything, but my bright sensory experience makes me think that I am "here" instead of everywhere. It's as if I have my face pressed up against a window pane or I have VR goggles on. It seems that I am in that world and it is independent of me, and yet if I relax and detach a little from the show on display, I can somehow "feel around" and find levers and switches which influence the scene...

EDIT: You might enjoy reading The PK Man by Jeffrey Mishlove, if you haven't already.

Being an atheist is okay, I used to be one too. But never disregard your own consciousness, it is by far the most valuable thing that could have ever been conjured up by the universe. I used to be a hardcore atheist at the age of 12, because I learned that the earth was made by consolidation of mass through gravity and that could just discredit the existence of a creator. But eventually I realized that atheism was only an idea of rebellion, it never sought to answer the more meaningful questions of life and is content with nothingness.

The multiverse theory that most atheists use to explain the creation of the universe eventually only became nothing but a gigantic assumption and just as far fetched as believing in a creator. I just could never logically accept that all of this order came from random chaos, I mean the shear amount of order that is present in this world really doesn't leave a lot of room for such random chaos to even occur let alone chaos being the main driver of the universe. Eventually I logically deduced the existence of God to be there, and slowly began establishing a connection between myself and God and tried to become "one with the universe". Eventually all of the answers for the most important questions of the world just became so apparent and crystal clear to me. Questions like why are we here ? why does evil exist ? what is the purpose of creation and of course telekinesis and some other cool tricks.

I have a completely open mind - happy to have my ideas shift around. So probably to say I'm atheist jumps too far; I am a whatever-it-looks-like-to-me! :-)

I'm not sure there is a "purpose" though. If everything is for all eternity, the only purpose that one can imagine is eventual collapse back to infinite potentiality, from where it all begins again.

The purpose exists in being, I mean think about it, if there was no purpose why would there even be an existence in the first place ? If things collapse back into the source then the purpose would exist in being, if there was no purpose there would be no being, there would be nothing to expand into and nothing to collapse into, just a purposeless dot. I later on realized that every element in existence exists with a purpose whether we understand that purpose or not.

I follow you, but I sort of "put that aside" because I have no access to the information. I'm quite happy to have unanswered questions, if the alternative is to have a placeholder answer from logic only.

Since we don't seem to retain memories prior to our lives (and it's not clear what is happening in cases where such things are reported), we are left in a wait-and-see position.

Which isn't to say we can't probe the nature of this environment we're in, the nature of ourselves. It definitely seems less "substantial" than one would assume, and more responsive. Which again makes me wonder about a larger given purpose. I'm inclined to think there can't be a purpose from an eternal viewpoint, except fluctuation itself.

Q: Well on the topic of recalling past life memories, you have to understand that doing that is a skill in itself, it is something to be honed and trained. If you saw a weak man failing at lifting a dumbell, would you say that all human beings can't do that ? Take life for example, every single element of life exists with purpose. All of life exists with the conscious intent to change the circumstances of it's environment and bring order to it and thus creating it's own purpose of existence. Order can only exist through intent, no matter how much you try to word it order can never independently exist in an environment of chaos. You might call it a fluctuation, but that's just saying that you don't understand it enough, a fluctuation is change that's it, you could say that all of life is nothing but a fluctuation, but even you know that life is a lot more than that. Try taking the time to understand the forces that govern our universe, take gravity for example, we can see it happening, we have the equations to have an idea of it's power and we are capable of predicting the force. But do we have any idea of why gravity even exists ? why are particles attracted to each other in a constantly expanding universe (order in chaos) ? Take any force of the universe, polar forces, magnetic forces, If you go deep enough it

doesn't look like anything else short of magic. I mean Max Plank pretty much discovered God in the Quantum universe, the rules the particles follow in Quantum space are as unpredictable as free will, he had a glimpse of the ether.

Just for that sake of humor I decided to connect these forces to human traits, I found that gravity connected with universal love and electrostatic forces were similar to polar love (love between a man and woman). Gravity holds entire galaxies and the major part of existence together while polar forces holds the atoms together thus keeping reality in check.

Every force suddenly seemed like a conscious act of God, every movement had purpose and reason, the whole universe was conscious, every force all the way up to the neurons in our brains a movement of God. Your very conscious mind is God separating from himself in order the observe existence from a different perspective.

I can explain to you what's happening in recalling past memories, and the ultimate purpose of existence. But all of these explanation are going to be all about the etheric space.

I guess I could have been more precise: We can't know from this present perspective. It's in the nature of being a perspective. Science, of course, doesn't answer "why?" or even "what?" it just answers "in what way". I can't answer purpose and so on. Those answers must be direct rather than thought about?

However, the true nature of things is timeless and spaceless, it seems to me; this is a created experience by me, but not the "me" that I conceptualise (the thought I have about me), rather the larger background me in which experiences arise. All information is accessible potentially from that perspective. The localised perspective is a filtering rather than an identity.

etheric space

How would you define that? As the background conscious aware space which knows no boundaries but within which all things appear?

the ultimate purpose of existence.

Is the ultimate purpose not... just to create and explore?

You may not realise it but you've pretty much answered most of those questions yourself. The etheric space is basically just as you have described, now you say that the perspective that you say is created by you, so does the whole world get created the more you explore it ? At the same time you cannot deny the identity of the perceiver because he is a creative observer. The observer creates and interacts with the world with his own "source" of being, because it all comes down to this, our minds are deeply interwoven with the rest of reality in an extremely intimate way, a machine can only analyse data no matter how complex you design it but a person is intertwined in the experience around as a single identity. You would now have to have two assumptions, say that you are not alive just like the rest of the universe or say that the rest of the universe is alive along with you, physically there is no difference between you and the rest of the universe and it is paradoxical to call yourself dead, so the most logical conclusion is that the whole universe is conscious in a way that we have yet to comprehend. The ultimate purpose of course being that the unified conscious force extended it's consciousness into manifestation to create this world and into us in order to have a more creative subjective experience.

Yes, I pretty much agree with this; this is my view.

I would say that what I am is a consciousness, and that I am in effect exploring the memories of a particular world, from a particular perspective. (This is experienced as creativity, discovery, and creation-by-implication, which are in fact the same thing.)

Since memories are "made from" thinking and thinking is "made from" the consciousness that thinks, there is no physical world as such. And I am not physical. Furthermore, all this means there is nothing special about "content". It's fun-stuff, explore-stuff, and it's all part of you. You're exploring your own mind. But that means you're also exploring every silly notion you might have. Don't take what you think-see too seriously; there is no "background solidity" to it.

Finally, the "content" that suggests I am limited to being-a-person is just that: an imagining. Actually, I am always the entirety of consciousness, it's just that I am experiencing the sensory image of a limited perspective. My intentions are always global, even when my perception is local?

Q: Awesome, I like your thoughts. I can't help but feel that we have been incessantly agreeing with each other, I'd like to know what are your thoughts about God ? For me after realizing that there are no boundaries between my mind and the rest of the world just meant an infinite amount of implications. Before I used to be an atheist, but after my reconnection I pretty believe every single religion that exits (or at least comprehend it to the extent of my critical thinking), I now understand unconditional love with wisdom, the origins of evil, and now I have a bottomless pot of pure joy which I can tap into whenever I please and just "trip out" in any location. Would you believe me if I told you I practice telekinesis ? no I'm not shitting you I can literally move shit with my mind ! As we speak I am making the wind blow through the branches of my neighborhood trees by just tuning my mind to the spirit of the wind and imprinting my spirit upon the wind. All this spirituality jazz is some absolutely sensational stuff which I really think you should have a go at ! And a person like you is in the perfect position to explore these realms because you have come to this conclusion of boundary less consciousness through your own reasoning and critical thinking, now just submit yourself to the beauty that is existence!

I can't help but feel that we have been incessantly agreeing with each other

I think we are! Same view with just different ways of describing it. Same reality, different metaphors kinda thing. Which is nice. :-)

The Big Guy?

I'd like to know what are your thoughts about God?

Hmm, I say:

It's the name we use to describe the undivided experience, that which everything is made of and from and is. What people call "unconditional love" is the direct experiencing of that undividedness - which is a matter of ceasing to narrowly focus your attention on an aspect of content. The water analogy is often used: water and the waves. But I think it is more accurate to say that "God" and "consciousness" is the colour blue. In other words, "blue" is everywhere in water, water is blue, and all waves are blue. The only property "blue" has is... blue. Consciousness and God have the property of being-aware and no other property. All divisions, relations, patterns, forms, shapes, content and experience are 'made from' this being-aware. It is a "non-material material".

Whats On Tele? vs The Dissolved World

Would you believe me if I told you I practice telekinesis?

Of course! Everyone's doing it all the time, unwittingly. We think we "act" but we don't - we experience actions. :-)

-- Allow me to ramble a little...

We confuse the present sensory experience with the world. In fact, I'd suggest that the world is a set of dimensionless facts-of-the-world dissolved into the background of awareness. There is no distance between objects or events. Both space and time are sensory formatting just as colour, sound, texture is. They are part of experience, not of the world as it is.

Sensory experience is like a mirage floating atop the true world, which is the shifting shapes of the sand dunes beneath (within a certain perspective).

And there is only First Cause.

So, when we decide to raise our arm what we really do is "request the experience of arm-raising". At that exact moment, a pattern is triggered, and laid out before us, which we subsequently encounter as our attention passes over it. We call that "doing", but that act of creation already took place. Our "doing" is actually the experiencing of patterns already laid down. When we attribute causes to effects, in actual fact both are effects - results from accumulated patterns created by will, deliberately or implicitly. If you want to lose weight, you might eat less and go running. But the eating less and running are just experiences; they have no causal power. It is the intention that these correspond to a later experience of weight-loss that produces the results (provided there are no contrary patterns).

Realising this, we find that all of our experience is directly caused - by the direct creation of patterns, partial aspects of which later appear in sensory experience. The only power is will, and will operates directly on the patterns. We "imagine that" the world is a certain way, and subsequent sensory experience falls in line with that. The weather unfolds in exactly the same way as the raising of an arm, for the same reasons and due to the same cause. Usually we only identify with "local" experiences (content arising in the body-space area; content arising within an arbitrarily limited timeframe) but all experiences are "our patterns".

You might find The Patterning of Experience worth a read - it's one of my attempts to encapsulate this aspect of things. And this one is relevant to weather. The weather definitely seems to be a thing!

-- Okay, ramble over...

He Sure Can Move!

I can literally move shit with my mind!

So I'm gonna say the better way to say this is: Update the facts-of-the-world, which you then experience. You are changing the "fact of where something is". You never actually move an object (there's no such thing as a spatially-extended object when you're not experiencing it).

I like that way of saying it because it's nice and general. It highlights that you can change "facts" that are the pattern behind your sensory experience right at this moment - or those that are supposedly not apparently here in "space" or in "history" or in "the future". All the world is here, now, and available for change; Your sensory experience arises spontaneously in alignment with it, effortlessly.

...by just tuning my mind to the spirit of the wind and imprinting my spirit upon the wind.

Is the feeling of this for you a bit like detaching then "sensing out" the thing you want to change, sort of "becoming it", and then "shifting the shape of it/you"?

How did you get into trying that, by the way?

Q: I'm enjoying the way you think you are not holding back your questioning mind in the least, and I'm enjoying the people here in r/philosophy because they actually take the time to question the world around, the people at r/atheism piss me off to new levels, they preach their ideas like dogma and refuse to see the world in a different perspective, the worst part is that they have no sense of direction what so ever and sometimes just end up becoming rude and terrible people. Your thoughts are exploring the spatial world around you and they look like they are about to burst! For me the conclusion of God came from the analysis of chaos. Chaos is nothing but the loss of order, is no different from entropy chaos in it's purest form without a shred of order would be nothing but sand like particles in space, with no direction, no internal forces like gravity or electrostatic forces, just plain dispersion of sand that is the final stage of chaos. To assume that order can ever be created from chaos is an extremely magical assumption because order is only a conscious force, order is an act of consciousness, you can never expect these sand particles to ever make up their mind to kind of fall in love with each other and recreate gravity where all of the particles begin to tightly hold on to each other in the dispersing effect of the void. I mean let's talk about gravity for a second, we have all of the equations that can predict the force of gravity and this equation is made up of variables that rely on a gravitational constant that apparently changes every few years so it's far from accurate, we have flexible 2D representation of gravity showing how it warps space time but this is only a visualization, we don't have a basic explanation of why one iron ball is attracted to another iron ball in space it's like as though all of these particles are in love with each other (unconditional love) and this love is what holds galaxies together, holds the solar system together and the love of Jupiter is what keeps us alive from meteors. There is just way too much order in the universe to say that all of this happened by chance, it's actually very foolish to even assume such a thing as order occurring from chaos. The very fact that the universe exists by default proves the existence of God. After taking the time to accept these truths and shift my perspective to unity consciousness I began unlocking many hidden powers that fully conscious entities are capable of, telekinesis being one of them. And no my friend I am not practicing telekinesis in a metaphorical sense, I can quite LITERALLY move objects at my command. Here check out these videos For me I have the most fun with aerokinesis where I make the wind move, With better established connection I can even control the rain and lightening. Again it's about tuning your mind to the substance of your target and impressing your soul upon it, to get a better idea of this would require a good understanding of chakras which I would be happy to tell you about.

I enjoyed your take on chaos! Loosely, I'd say that the structuring of reality is the structuring of experiencing - and this is the structuring of our minds. Which is very much the same idea, with different words, I suppose. This is not a new idea - Immanuel Kant and others long ago said that things like "space" is more like a sense than a reality. And he basically says something like I do: the world is unstructured and dissolved and effectively an "infinite gloop". Which is really to say, it is nothing at all.

We are the order. And behind order: nothing.

Quick note: When I talk of "metaphor" I don't mean that we can't literally make changes. I mean it in the sense of what I call "Active Metaphors" - that the metaphors you adopt to describe experience end up shaping that experience (described a little in my post about The Patterning of Experience elsewhere). In your case, adopting the idea of chaos and love has pre-formatted your world to allow such experiences to occur (in my thinking). So, in terms of influencing the world, your examples are quite direct. By which I mean, you are dealing with objects and the environment that you can see and are present. Have you also experimented much with stuff outside of that, more abstractly?

Like, experimenting with things which aren't restricted spatially and temporally (since space and time are part of the mind's experience, and not part of "a world"). This is where we cross over from being an "Entity God" (a located presence with power) to a "Fundamental God" (that which constitutes the world and creation itself).

Aside - Can't recall if I've mentioned it before, but have you read Jeffrey Mishlove's The PK Man? Anyway, it's quite decent read for those unpersuaded of the possibilities of direct influence. Kirby Surprise's Synchronicity, meanwhile, deals with more metaphor-based approaches (decent interview with him here). If you get very bored, over the last while I've posted a few things at this subreddit [/r/Oneirosophy], in terms of techniques and worldview. Mostly about opening ourselves up, rather than specific targets.

Q:I was just checking out the r/onerosophy subreddit and I'm in love with it, that's it no more beating around the bush with you, I am going to tell you my ultimate theory about existence, I am primarily Hindu but I am going to use Christian metaphors which are very easy to understand. By default it is impossible to assume order can ever come from chaos, so therefore there was a source of "intent" for everything to be, let's call this source as God, the basic crucible of light for all of existence. I'll explain to you several theories regarding God and I hope you can piece them together, let's first start with the 'Lucifer Experiment', imagine God as a ball of light, all of existence and consciousness comes from this single source, God is a force of creation and does not find solace in an empty and mundane existence of just being a boring ball of light, this ball wants to explore and manifest into the void around it, the ball begins to grow tentacles at the ends of which are tiny balls of light, each of these balls are still the same source consciousness of God and God observes the rest of the universe through the awareness of these tiny balls. Let's call this tiny balls angels, they remain constantly tethered to God, but God is still bored because he is still not outreaching himself into all of existence fully, so he decides to separate and divide himself in a very unique way. One of the tiny balls under the will of God decides to separate itself from the central ball of light by disconnecting the tentacle like tether that kept it attached, because of this tiny ball of light who we will now call lucifer was disconnected from divinity, lucifer now after seperation no longer felt the divine bliss of unity and complete awareness, but through this seperation he now has independence and free will, he can make his own decisions without the interference to God. As Lucifer explores the void, he gains the strength to manifest and the knowledge of the existence, but due to natural causality many of the decisions that Lucifer makes is subjected to the destruction of natural consequence and because of this he begins to manifest his own hell, there is nothing he can do about it it just plain causality and this was a part of God's intention to experience the void since God and Lucifer are still one and the same, and thus Lucifer remains meditating in the fires of hell where he is in unity with reality and in unity with divinity, God and Lucifer are constantly helping each other in maintaining balance. Now that this duality is set up, God can begin the creation of a middle earth where he can experience the ultimate form of a subjective reality, In the Garden of Eden when God created Adam and Eve through which his consciousness exists, he wanted to Adam and Eve to live a world of conscious freedom, Adam and Eve only remained in the Garden of Eden as long as they were "tethered to God" but God wanted them to be free so through the spirit of Lucifer he enticed them to eat the apple of knowledge which will give them the ultimate strength and knowledge to face the harshness of the world of causality, but in order to make this experiment pure he had to make sure that Adam and Eve chose to eat the apple under their own free will, so he pretended to not be watching while Adam and Eve disobeyed him to eat the apple. The experiment was a Grand success although not entirely for Adam and Eve, since they were capable of demonstrating free will they had the power to face the harsh and real world and thus they were disconnected from God and the Garden of Eden disappeared thus leaving them to face the world with nothing but their own knowledge, strength from Lucifer and unity and divinity from God. My life after death theory:

When it comes to life after death I believe in the Hindu theories of reincarnation as they make the most sense, I don't believe in an eternal hell or heaven since one is unnecessarily evil and the other horribly mundane and pointless. I believe that that once you enter the metaphysical space after you die, the space naturally reacts to your thoughts and your mind but only temporarily, just like in a dream if you have good thoughts you will get good dreams, if you have bad thoughts you will get nightmares, in the same sense if you were a good person you will only manifest good things but if you were a hateful person you will only manifest a horrifying and cruel reality which will attack you back because in this place there is literally no boundary between your mind and the rest of space. Only until you are cleansed of your wicked thoughts and you are capable of creating a beautiful reality will the metaphysical space react naturally to your purified mind. Lucifer makes sure that the souls who are experiencing this cleansing do not get destroyed and lost into oblivion, he keeps them all in one place where the evil souls can atone for their sins together in a single hell space. Every single thing in existence has the breath of God present inside it, everything from dogs and cats to trees and rocks, literally everything is conscious in some sense. In life this conscious energy keeps getting recycled through the process of reincarnation, as each soul gets more and more purified with each incarnation they receive more and more energy from God to reincarnate to a higher conscious creature, so if a person lived a good life he gains a lot of conscious energy of love from the people around him and his surroundings that he will end up getting a better afterlife in a family where that level of energy will match and resonate, while a bad person will end up losing energy and thus end up in a much more poorer after reality or even worse might have to be reborn as a creature of a lower intelligence and conscious awareness to relearn what it truly means to be alive. as of now the whole point of our existence is to improve our subjective reality to such an extent that we exist in resonance with the rest of reality to the point that we can consciously re-tether ourselves with God and leave the cycle of birth and rebirth and achieve moksha or liberation and take all of our experiences back to God.

Ah-ha!

More later, but at its root, this seems to be the story of "cause and effect" vs "direct will", of second causes vs First Cause. Of accumulated memories shaping subsequent experiences - and the tale of their realisation and dissolution!

Yup, in all of existence we are the main show, life trying to establish itself against causality and be in resonance with manifesting reality!

...

Consciousness comes first becasue it is the material which takes on the form of experience. (Let's call it "awareness" maybe, since "consciousness" has multiple meanings - really we are talking about three ideas: consciousness, conscious-of, and self-consciousness.)

All other thoughts and content are shaped within that. It is before science, it is before metaphysics, it is before everything. It has no particular properties iteself at all - except the property of being-aware.

Science is the study of "observed regularities in experience", inferring concepts via distinction and reconnecting them with relationships. What those regularities are "made from", it cannot say. That would be like trying to describe water as being "made from" waves. Not a "byproduct", then, but something that appears within it.

Q: *It is before science, it is before metaphysics, it is before everything does this mean anything? It sounds like poetry*

In the same way that "matter" is before atoms, and "colour" is before a painting, "consciousness" is before content. Actually, that's not a great comparison. Maybe "eyes are before seeing" and "water is before waves" - you can't describe water as being made from waves.

I don't understand or condone this form of thinking

In what way?

The point being made is that the reason it is difficult to study consciousness with science is that science deals with the observation of regular pattens in experience. Consciousness being what those patterns are made from, cannot be studied by it. Which is not to say that self-consciousness and the experience of being conscious-of something can't be studied; but that is content. The reason for the "form of thinking" above is that at this level you can't really say anything about this, apart from something like "consciousness the fundmental nonmaterial material whose only property is being-aware, everything else is patterns in and of this" - or similar.

Q: *science is that science deals with the observation of regular pattens in experience. Consciousness being what those patterns are made from, cannot be studied by it. This doesn't hold up though - the study of the patterns we see in nature brings results. The reason consciousness is beyond the reach of science so far is that we haven't been able to define or measure it. We come at it from our personal experience side of things but have nothing in the physical world to point at and say "lets measure that". So I think we agree that it can't be studied directly at the moment but with slightly different paths to that conclusion.*

Yes, the study of patterns we see in nature brings results - "observed regularities" - very successfully. For consciousness, though you hit it right...

The reason consciousness is beyond the reach of science so far is that we haven't been able to define or measure it.

We don't really observe consciousness at all, externally or internally; I'd say because it is not a thing. We only experience being it. (It is that which, in subjective experience, things are made of.)

So, as you say, we can't define it, we can't detect it with the senses - so it can't be studied scientifically. And nor will we ever, I suggest. (We might be able to study the self, and the content of consciousness, but not actual consciousness.)

I'm glad you brought this up, because the objective existence of Self is at the center of the discussion about the nature of consciousness: we're not actually talking about the nature of consciousness, so much as the nature of Self. It's also at the core of a philosophical problem camouflaged as a consciousness problem: free will vs. determinism - is consciousness a movie "we" are watching and choosing (separate from the brain somehow) or is it just a light show brought on by conditioned biological reactions to an environment (the brain itself)? I've spent the last 4 years studying the mind and meditation in Zen monasteries and probably the most frustrating part of this whole inquiry about the nature of consciousness is that when you try to investigate it experientially it is seen as inseparable from reality itself, which is why Zen masters went so far as to deny the very existence of this thing we think of as "mind" or "consciousness" as anything but a mistake of perceptive illusion for reality. There is something else, however, Mind without any preconceptions or illusions; I've only glimpsed it a handful of times, but I feel that no matter how long I was able to see it unfold I wouldn't be able to actually describe its quality or function. "Whereof one cannot speak, thereof one must be silent," which is some bullshit frankly haha.

You're right about this, and it's the next step of subtlety for the metaphor. It's a bit more long-winded, but the quick version is that the mind is "structured" with accumulated patterns. At any moment is the current spatially-organised sensory expereince, but also the "format of mind" which are the habitual patterns which experience "snaps-to" or is funneled along. These patterns are "dissolved into" the background.

Experiences leave traces which in-form subsequent experiences. What you experience as reality is really the "format of your mind" therefore. You can't separate the two. There is no reality "made from objects" beyond your mind; objects are patterns of the mind.

If you release your grip on expeirence, the first thing that relaxes (the first folds in the blanket to release) is the sensory experience, then the sense of space and time, then increasingly the other levels of "formatting" untl you are experiencing just "openness". Since this is not patterend at all, it cannot be described in language (because language requires division and contrast - it is built upon distinction).

That's my best edited version anyway.

Q: *There is no reality "made from objects" beyond your mind; objects are patterns of the mind. You went full idealist. You never go full idealist.*

Ha :-) Well, I'm not sure it's quite the full "Idealist Jack" thing...

I have to first apologize as one of my deep conditionings through my training kicked in as I read your comment: there's an intense prejudice towards conceptualizing the mind in formal Zen training, which I'm sure you can understand and appreciate (the ideal Zen student is a genuine mystic, not a philosopher, even studying Buddhist literature was highly discouraged). I am however interested in the source of this iteration on the "levels of formatting" you mentioned. Could you hook me up?

The source as in, practically?

In terms of experience, I think you can experience it through different levels of attention and so on, and by inference. (That background "felt-sense" is what I think of as the dissolved meaning, which can be probed.)

In terms of a history of how it comes to be like that within you, I'd say you start off blank - then noise, then clustering, then linked channels, then more complex patterns, then forms - from birth onwards the world starts forming itself in you.

I am an epileptic, who has unfortunately lost consciousness several times due to seizures. I have always just drop to the floor and go straight to black (nothing there) and woke up disoriented a few minutes later with a badass headache and a sore shoulder. The best way to explain consciousness for me is to control your surroundings and see how it effects you. If it isn't the desired effect, you aren't conscious. I am using my dreams as an example. Usually when weird stuff just start appears out of nowhere is when I wake up... I feel dreams are just past experiences mashed together with that days stress/emotions desires. Call me crazy I guess.

The idea of testing the (nature) of consciousness by attempts to control the environment is quite interesting. Not sure I agree with you on dreams just being past experiences - if you have lucid dreams (aware you are dreaming while in the dream), you'll see that it's much more creative and interesting than that, and that there is no way to tell the difference between waking and dreaming except for the fact that you can recall having "been somewhere else" before you were in the dream. Without that memory, you would not be able to tell.

Well my experience will vary from others. I am on 4 seizure medications. Depakote, Lamictal, topamax, gabapentin. More importantly, I am on a decent dose Dilaudid for pain. And have been for a couple of years I have a feeling that influences my dreams a lot as well.

Can you remember what your dreams were like before, vs now?

EDIT: Apologies to other readers - thread goes slightly off-topic now, but was interested if any consciousness effects that ran over into dreaming.

I have had my epilepsy since the summer of 2002. It started two weeks after I started working at a grocery store :/ No it feels like they have always been this way for me. And I have only been on my dilaudid for 2 years. Are you a M.D. or Professor, or just curious? I'm willing to answer whatever I am just wondering.

No, just curious! Because the topic is about consciousness, and I think the area of dreams has a lot to say about it. But more than that - because the whole "brain functioning vs subjective experience" area is at the cutting edge of it - people with unusual experiences, like yours, are fascinating.

Yea sure. I understand the whole REM sleep usually starts around 3 hours into your sleep (where the actual dreams are at), but I usually sleep around 10 hours a day... My body needs it. The dream I remember is at the end. For me its one of 3 situations. 1'st a real external event sets me off like a loud car, and it wakes me up. 2nd. Things start to feel out of control. You are talking to someone at work, but you don't remember what. Someone else joins the conversation that has no reason being there. Say someone from High School or that special someone on Facebook you really like. Then someone else joins as well. You start to feel the anxiety build, and build, until you can't take it anymore. And I wake up feeling like a failure. 3rd one and the most scariest one for me. I am falling into the infinite darkness with my arms folded on my chest. I only fall for a few seconds, but you wake up feeling like you almost died. Not short of breath or anything, just huge amount of adrenaline there... Edit. Most of mine seem to be based at work. Seriously when I was hallucinating at the hospital from being hopped up on so much seizure meds (they OD'd me) I was dreaming that I was calling people up to check customers out because it was so busy.

The infinite darkness... ego death? Impending annihilation into the background awareness! Pretty good dreamstuff. There's a book by Robert Waggoner on lucid dreaming that's really good, if you ever feel the urge to explore. Having an "interestingly wired" brain might make for good exploring territory!

...

That's great. As said elsewhere, my problem isn't really the metaphor, so much as it gets left at that - you need to next step to avoid a dual perspective and more accurately correspond to experience. I'm all for anything which helps folk along a step, really.

I think the idea that "deep meditation" is about experiencing without objects or a "you" is a total misconception: that's called deep sleep.

Actually, I originally had "deep sleep" as the completely objectless, and "deep meditation" as just being a perceptual/space pattern object with no content - but it was getting a bit detailed for a quick comment.

POST: What is consciousness for? — Consciousness is a life-transforming illusion [Keith Frankish] (/r/philosophy/)

This sort of theorising seems a bit pointless if we don't actually state what we mean by "consciousness". Several different sorts of things seem to get muddled in together, or mistaken for one another. From a subjective point of view, to begin:

- Consciousness-Of - A person's awareness of the content of an experience.
- Self-Consciousness - A person's identification with part of that content as oneself.
- Consciousness - A person's raw experiential sense of "being" or "presence" or "I-am-ness" which persists independently of content or identification, but which content seems to appear within.

The first we can explore as the correlation between environment, body and brain states, perhaps. The second with brain states and psychology, possibly.

The third is more problematic:

The texture of it may vary with content, but the presence itself seems independent. And it can only exist in the present, since any reports of experiences then are reports of content (or the memory of content) now.

It's a direct fact of experience, and it's probably the only thing we all know for certain. But it is not associated with any particular content, and so it cannot be studied by looking for correlation. It's an "isness" that precedes thought, and so cannot be funnelled through the division into parts and subsequent arrangements in mental space that theorising requires. Perhaps it cannot be captured by a story at all.

POST: The Simulation Argument (/r/philosophy/)

The simulation argument is surely just a modern way of describing the notion that the world-as-it-is does not exist in the form that we experience it.

In other words, it is not really a "spatially-extended world, unfolding in time". Space and time are aspects of experiencing rather than aspects of the world; they are more like "base formatting" of the human mind. The room next door is not actually "over there".

The world then becomes more like a collection of "dimensionless facts" dissolved into the background of experience; a superposition of implicit patterns which can be unfolded into sensory form with attention. Which sounds like a mix of Bohm and Zen - the "background" would be consciousness?

POST: "Philosophy is the quest 1) to discover the tacit assumptions that we operate on; 2) to critically examine those assumptions; and 3) to improve upon those assumptions by replacing them with better alternatives." (/r/philosophy/)

Q1: Another way of saying my favorite definition--philosophy is essentially metacognition. Thinking about the act of thinking.

Q2: Generally speaking, agreed. My favourite formulation is that "Philosophy is the black-box scientific investigation of human minds."

Q3: Really? I'm not sure how metaphysics could be encompassed in such a definition. Or ethics. Surely the unreliability of the human mind is an obstacle that philosophy strives to deal with, but the mind is not necessarily itself the object of the study.

I suppose he might update it to say something like: the investigation of the content and properties of mind (by the mind). So in that sense, the mind is always the object of study, since all study is the study of appearances within the mind. Typically, we distinguish between two categories of content - "thoughts" and "sensory experiences" - but neither are outside of ourselves (as mind).

Maybe it would have been clearer to say "brains" rather than "minds". (Incidentally, this is where "black box" becomes important - no neuroscience allowed.)

"Brains" is perhaps problematic though, depending on the context? Unless we are just using it in the loose sense of "the place where my thoughts appear", but I think that can be confusing when exploring certain areas. We never actually experience "brains" ourselves - only sensations, perceptions and thoughts arising in mind (where by "mind" I mean something like "awareness" rather than just "the place where thoughts hang out"). Maybe there is another term with less baggage that can be used for referring to "the context of experience".

POST: If i ever got time traveling powers (/r/timetravel)

Q1: What if time operated on the Novikov Self-Consistency Principle? That is, all alterations to the timeline have already been incorporated, so you can change nothing about the perceived past. In the example in that article, it basically states that while you can't prevent the Titanic from sinking, you can allow it to happen, save the people who would die, and replace their bodies with perfect imitations. This way, nothing in the perceived past has changed. This interpretation of time would mean that if you did go back in time with the purpose of stopping the Titanic from sinking, you are doomed to failure because we know that it did sink. I like this view of time because it elegantly avoids so many of the paradoxes that naturally arise from time travel.

[QUOTE]

Novikov self-consistency principle
The Novikov self-consistency principle, also known as the Novikov self-consistency conjecture and Larry Niven's law of conservation of history, is a principle developed by Russian physicist Igor Dmitriyevich Novikov in the mid-1980s. Novikov intended it to solve the problem of paradoxes in time travel, which is theoretically permitted in certain solutions of general relativity that contain what are known as closed timelike curves. The principle asserts that if an event exists that would cause a paradox or any "change" to the past whatsoever, then the probability of that event is zero. It would thus be impossible to create time paradoxes.

[END OF QUOTE]

We only know that it did sink now. If you go back and change the Titanic sinking, it will not have sunk anymore, and we will all know it never sank. The whole landscape of facts gets updated. The sequence of events, if I go time-travelling from 2016:

Global Memory Landscape Version 1:

- In 1912 it was true that the Titanic sank in 1912
- In 2015 it was true that the Titanic sank in 1912

In 2016 I travel back to 1912 and prevent the sinking of the Titanic, at which point:

Global Memory Landscape Version 2:

- In 1912 it was true that the Titanic did not sink in 1912.
- In 2015 it was true that the Titanic did not sink in 1912.

Personal Memory Landscape:

- In 1912 it was true that the Titanic sank in 1912.
- In 2015 it was true that the Titanic sank in 1912.
- (I travel back in time and tweak then return.)
- In 2016 it was true that the Titanic did not sink in 1912.

Everyone else's memories would be updated to the not-sink version; only I would recall it being different. Consistency is preserved at all times.

Q1: The problem with this is that it would have to affect yourself before you ever went into the time machine. At the point where you travel back in time, you separate your own timeline. You have pre-travel you, and post-travel you. If you go back and change the timeline, then only post-travel you would retain the memories of the Titanic sinking. Otherwise, you would have to be born with an alternate set of memories. The paradox arises from this- how does pre-travel you ever become post travel you? Pre-travel you never has a reason to travel back in time because, in his memory, the Titanic never sank. This leaves a post-travel you without an origin, so you are an effect without a cause.

You're right ... yes ... that this amounts to a personal timeline perspective: my end-point is not actually the same square on the "grid of all possible moments" that I left from. In fact, as soon as I jump to 1912 it is not the 1912 of my history, simply due to my presence. This side-steps the assumption that time is sort of always running (constant cause and effect). It avoids the paradox, but it means that I didn't truly change the present moment that I left - which remains self-consistent but now without me - I instead went to a different moment where my actions are its history (guy suddenly appeared; ship was saved).

What I've really done then is more like dimension jumping - jumped from Global Landscape 1 to Global Landscape 2 - rather than time travel, although it will seem like time travel ito me. Unless we allow Primer-style multiple instances of me, without a "causal catch-up". In short, a constantly overwriting time loop. But then I can never get to the Titanic anyway; I can only go back to the moment of the availability of time travel.

Right. So self-consistency must be preserved, and that can be done without having "causal catchup", but it means either revise-able timelines or an additional dimension. Phew!

POST: New to the sub, and have found this link quite interesting. (/r/timetravel)

[POST]

In theory, is this possible? With the we are all one? I think I read something about the infinite grid? As us just traveling a grid which is "time line". If this is possibly true, then wouldn't reddit be just one big load of conversations with myself?

You were on your way home when you died.

It was a car accident. Nothing particularly remarkable, but fatal nonetheless. You left behind a wife and two children. It was a painless death. The EMTs tried their best to save you, but to no avail. Your body was so utterly shattered you were better off, trust me.

And that’s when you met me.

“What... what happened?” You asked. “Where am I?”

“You died,” I said, matter-of-factly. No point in mincing words.

“There was a... a truck and it was skidding...”

“Yup,” I said.

“I... I died?”

“Yup. But don’t feel bad about it. Everyone dies,” I said.

You looked around. There was nothingness. Just you and me. “What is this place?” You asked. “Is this the afterlife?”

“More or less,” I said.

“Are you god?” You asked.

“Yup,” I replied. “I’m God.”

“My kids... my wife,” you said.

“What about them?”

“Will they be all right?”

“That’s what I like to see,” I said. “You just died and your main concern is for your family. That’s good stuff right there.”

You looked at me with fascination. To you, I didn’t look like God. I just looked like some man. Or possibly a woman. Some vague authority figure, maybe. More of a grammar school teacher than the almighty.

“Don’t worry,” I said. “They’ll be fine. Your kids will remember you as perfect in every way. They didn’t have time to grow contempt for you. Your wife will cry on the outside, but will be secretly relieved. To be fair, your marriage was falling apart. If it’s any consolation, she’ll feel very guilty for feeling relieved.”

“Oh,” you said. “So what happens now? Do I go to heaven or hell or something?”

“Neither,” I said. “You’ll be reincarnated.”

“Ah,” you said. “So the Hindus were right,”

"All religions are right in their own way," I said.
"Walk with me."

You followed along as we strode through the void.
"Where are we going?"

"Nowhere in particular," I said. "It's just nice to walk while we talk."

"So what's the point, then?" You asked. "When I get reborn, I'll just be a blank slate, right? A baby. So all my experiences and everything I did in this life won't matter."

"Not so!" I said. "You have within you all the knowledge and experiences of all your past lives. You just don't remember them right now."

I stopped walking and took you by the shoulders.
"Your soul is more magnificent, beautiful, and gigantic than you can possibly imagine. A human mind can only contain a tiny fraction of what you are. It's like sticking your finger in a glass of water to see if it's hot or cold. You put a tiny part of yourself into the vessel, and when you bring it back out, you've gained all the experiences it had."

"You've been in a human for the last 48 years, so you haven't stretched out yet and felt the rest of your immense consciousness. If we hung out here for long enough, you'd start remembering everything. But there's no point to doing that between each life."

"How many times have I been reincarnated, then?"

"Oh lots. Lots and lots. An in to lots of different lives." I said. "This time around, you'll be a Chinese peasant girl in 540 AD."

"Wait, what?" You stammered. "You're sending me back in time?"

"Well, I guess technically. Time, as you know it, only exists in your universe. Things are different where I come from."

"Where you come from?" You said.
"Oh sure," I explained "I come from somewhere. Somewhere else. And there are others like me. I know you'll want to know what it's like there, but honestly you wouldn't understand."

"Oh," you said, a little let down. "But wait. If I get reincarnated to other places in time, I could have interacted with myself at some point."

"Sure. Happens all the time. And with both lives only aware of their own lifespan you don't even know it's happening."

"So what's the point of it all?"

"Seriously?" I asked. "Seriously? You're asking me for the meaning of life? Isn't that a little stereotypical?"

"Well it's a reasonable question," you persisted.

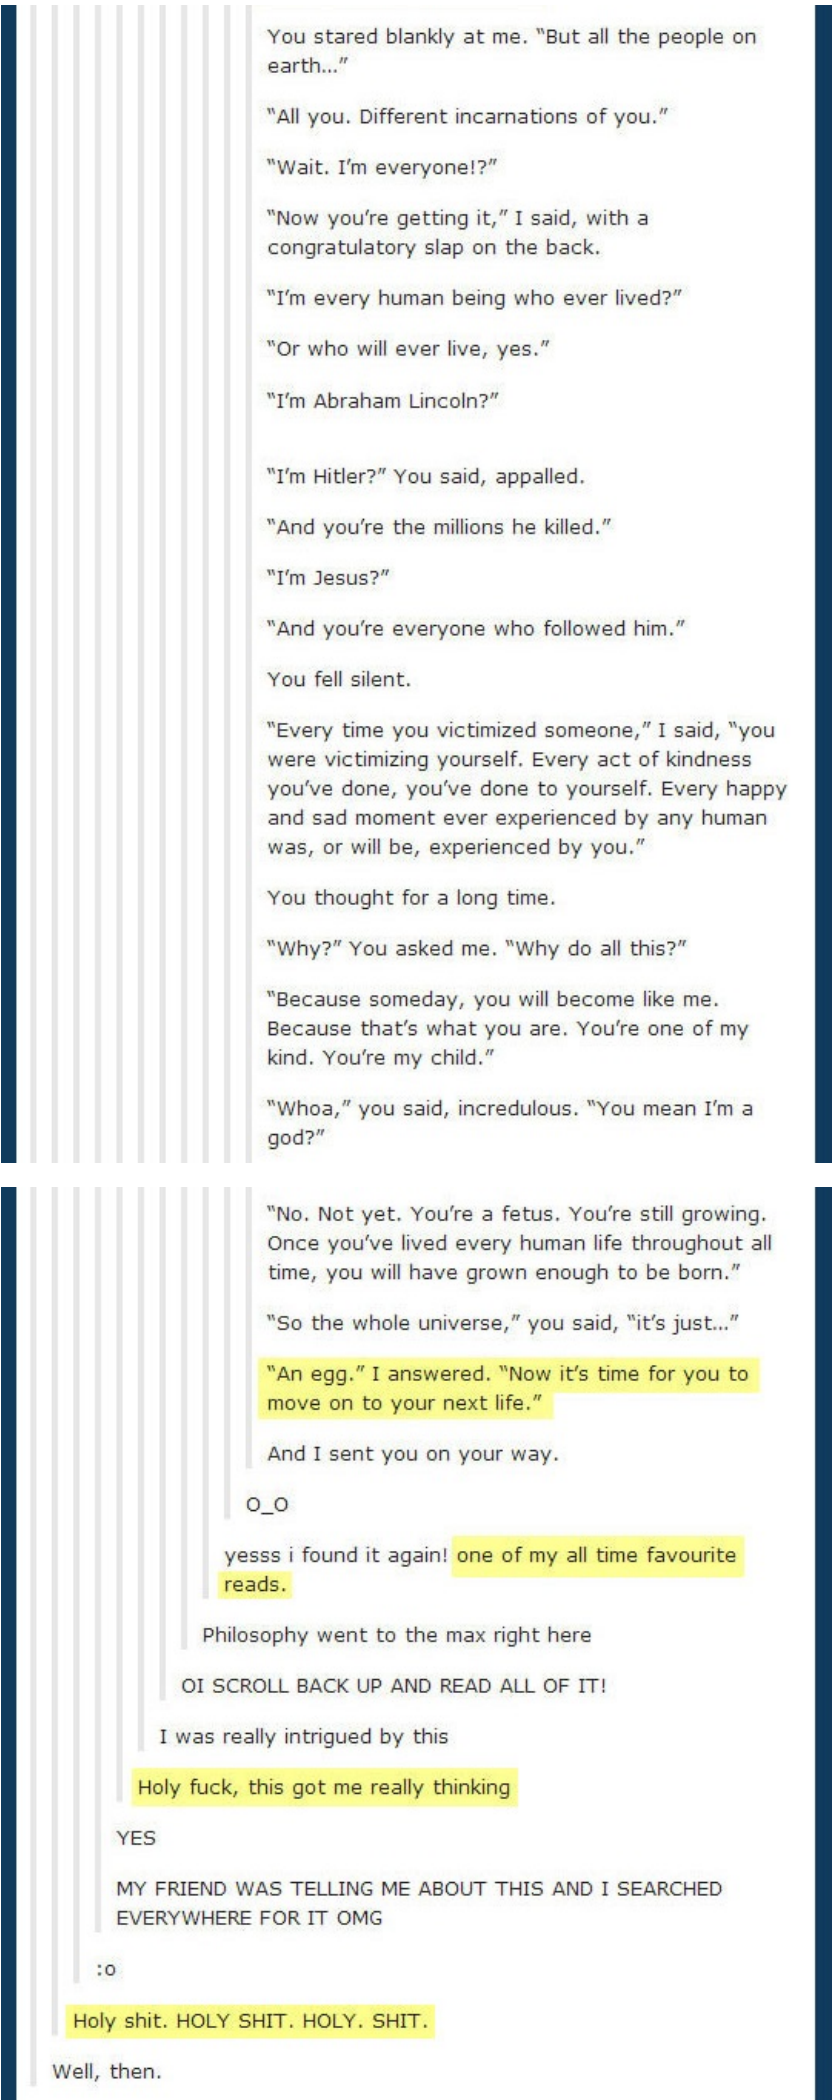

I looked you in the eye. "The meaning of life, the reason I made this whole universe, is for you to mature."

"You mean mankind? You want us to mature?"

"No, just you. I made this whole universe for you. With each new life you grow and mature and become a larger and greater intellect."

"Just me? What about everyone else?"

"There is no one else," I said. "In this universe, there's just you and me."

[END OF POST]

The Infinite Grid.

Basically: what we actually are is "perspectives of consciousness" which are having a being-a-person-in-a-world experience. Nothing is really happening, and time never passes, it's just that we scan our attention across a subset (or "trajectory") of all the possible experiential moments. You could call this a "time line", although it is completely personal. All the moments already exist. We could think of a trajectory as a "strand of thought" that is appearing in our conscious aware space. It's just that this particular thought is very bright and 3D-surround and fully immersive, so we assume we are "there" somehow. We are all "one" because consciousness itself has no properties. The consciousness you are cannot be distinguished from the consciousness I am. You can even get a feel for this directly:

- Currently, you are looking at this screen with your attention. Now, turn your attention towards "the place you are looking out from". What do you find there? Can you describe it?

These leads to relevant-to-link questions like: who or what are the other people we encounter? What happens when we get to a position where there is no plausible next-moment? And so on.

Could you lead me in the direction to learn more about this theory? I find it very plausible.
Once you become aware of the infinite grid and your trajectory, is it possible to change it? Or is everything already predetermined?

Well, I made it up! The notion of a configuration space of possible states is nothing new of course (see Julian Barbour's The End of Time, for instance), although this formulation and the connection to subjective experience is probably fairly novel. It's what I call an "active metaphor" and is based on the notion that there is no actual underlying structure to experience. This means we are able to choose a conceptual framework we like and format ourselves with it. So we get to pick one like this which has "enabling" properties...

The grid itself is basically an unsorted set of all moments; your trajectory is an ordered subset of those moments defined by your current state. The trajectory is deterministic in the sense that for as long as your state remains the same, the path is defined. However, if you can change your state, you can change the path to a new determined state!

This is doable because the entire grid is actually dissolved in the background of your conscious perceptual space at all times, and the subset (or "world-pattern", or definition) is simply the moments which are being associatively triggered into prominence by your mental patterning. Changing that patterning = changing the world-pattern = changing the trajectory. A potentially useful way to envisage this "dissolved" aspect: The Imagination Room

Sssh... play along like we are all separate. There is plenty of time to stop playing after you die.

Speak for yourself! I mean, myself. Oh, we are so confusing...

POST: What would you do if you could go back in time? (/r/timetravel)

Well, this post is a bit /r/hailcorporate (ish), but it's always a good question. :-)

Aside - Your pitch video is interesting as a concept, but for me it doesn't give a coherent "feel" (plus for me the voiceover and the acting is too self-consciously "performed", but that can be personal taste). Of course, I'm assuming the series is meant to be somewhat serious in tone? If I were doing this, what comes to mind is, I'd be going for something like the propaganda videos in the film Children of Men, and the in-film advertising material that the Foreign Office put together for it. How far along are you with the series?

Resuming the question - The devil would be in the details. But here's a quick sketch of what form my approach would take: If we're assuming here that I have to come back to the present in some way - i.e. it's not a case of resuming life from a past point, it's about making changes, jumping forward, and seeing them reflected now - there's not much point in going back and saving anyone. The time gap between "then" and "now" will likely put you in another situation with similar problems. You cannot "solve" history because it is not a problem, it is an interconnected pattern. So the trick is to minimise that gap, so that "then" is a fully managed lead-in to "now". Knowing in advance that I would be going back in time with the show (e.g. I get selected to participate and the winner travels in time one month from now), I would spend the month paying very close attention to events global, local and personal, gathering as much information as I could about all spheres. Then I win the show, go back in time one month into the past - and do not enter the show. I spend the time creating the maximum beneficial version of that month financially, personally, and so on. If I were making your show, I would have one episode where a contestant does something along these lines, in such a way as the existence of the show itself was threatened by "prior deletion". Maintaining the existence of the show despite adjustments in time would be one of the ongoing challenges the show-runners face, actually.

POST: Time Travel!! Post what you think or know about the subject.... (/r/timetravel)

Perhaps you could kick off the discussion by telling us what you "think or know" about the subject?

Q1: well actually im a student pursuing physics in college and my area of focus is space time mostly, we've been using 3d software to create artificial wormholes (well thats mostly animation through autodesk maya) . time travel is the ability to travel in time from one point in time to another point in time. future time travel is more possible than past is . well thats because you cant go beyond the date the time machine was built , so every extra day that is required to build a time machine is one extra added day that we are moving further away from our own history. time travel is mostly into existence (the topic) because it is used with context to the speed of light c (also called causality in some very specific cases). 3x108m/s is the rounded off speed of light and we three dimensional beings cannot travel higher than this speed. even reaching these speeds is a biological problem as our body's are not designed to withstand the heat that would be generated when our human bodies are accelerated . small particle accelerators are used to help small particles attain these speeds and in some cases it was noted that a particles normal lifetime would be say x seconds (the seconds assumption only to make the discussion simpler) . when accelerated in a particles accelerator , the life of this particle would be increased by say x / 2 seconds as a result of which x + x/2 would be the new life . well i could go on and on , but ill get back on this. this is a start i guess. cheers!

That's better! So the obvious question for you is: What do you think is the connection between experiential time (the changing of forms arising within the senses or "perceptual space") and conceptual time (the abstract notion of time used in the equations and diagrams of physics)?

Q2: This is actually a pretty good question. It got me thinking about what we actually use to define time/seconds/etc. Which seems like an obvious answer: observe something that changes at a steady pace and then count it. Which is more or less what we do:
It is quantitatively defined in terms of a certain number of periods – about 9 billion – of a certain frequency of radiation from the caesium atom: a so-called atomic clock. But then why base all of our physics around a certain number f periods of a certain frequency of radiation from the caesium atom? And if relativity changes this (the twins paradox), then how can we really have reliable math on this?
Doing some further digging, it appears that we didn't simply 'measure' the speed of light, but instead calculated it based on this 'second standard' along with the meter which is based on the speed of light:
Its precise value is 299792458 metres per second (approximately 3.00×108 m/s), since the length of the metre is defined from this constant and the international standard for time
Huh. Interesting stuff.

Well, I wouldn't ask a rubbish question, surely? :-)

Right. So we never really get to experiential time, rather we bootstrap an abstraction called "time" and then reference it in a circular manner. Which is fine, because all conceptual frameworks are essentially "castles in the sky" in this way, but it's interesting to actually focus on it, because we usually handwavingly assume that our concepts cleanly map to "real things", when it's not really that straightforward.

Q1: well i believe that time in itself is an abstract concept based on its relativity to people.staring at a beautiful girl , an hour seems like a second. sitting on a hot pan , 3 seconds seem like 3 years. when somebody asked us to keep track of time , we all reference to it based on our relativities even though the end values for each one of us turns out to be the same (say when comparing 10 18year olds.) . maybe we 3 dimensional beings cannot understand time in its entirety.

In what way can an hour seem like a second? What, exactly, is the actual experience of "an hour" or "a second"? Einstein's cute-joke answer doesn't really examine that (nor was it intended to, of course). It was basically a way of suggesting that a description of a state change itself does not provide a description of the changing between states. But does this not make a nonsense of the whole idea of time travel, then? One cannot journey experientially along a diagram. If time is purely an abstraction, and is therefore never actually experienced other than as mental imagery, then what a "time traveller" is truly seeking is something else: a discontinuity in the content of experience. And following from our discussion here, that is something that happens "before" time.

POST: If time travel to the past is possible, you can't change the past. (/r/timetravel)

[POST]

This is how I tend to look at time travel to the past. Since the past has already happened, you cannot change it. If a time machine allowed me to travel to the past, and I conspired to stop a murder, it would be impossible. Something would prevent me from stopping it. If I wanted to go back in time and tell myself not to buy that junk car when I was 20, something would prevent me from doing it. I never saw my older self. I DID buy the car. Therefore, even if I tried to do this, I wouldn't be able to.

[END OF POST]

How exactly would "something" stop you from doing it though?

Q1: No idea. It's not like there would be some "force" prohibiting you from doing it. It just wouldn't be possible. There are an infinite amount of possibilities for your future. So there are an infinite amount of possibilities of how you would be prohibited from changing the past. It has already occurred. If you attempted to go back in time to kill Hitler in the year 1900, you could attempt it an indefinite amount of times, and you would fail. You would just fail. How you would fail is impossible to predict. There are endless possibilities. The past is still the past, even if--on your personal timeline--it's your future.

See, that's a problem - no proposed mechanism. And if there was a mechanism, then there's no reason I can see why it isn't controlling you right now. Perhaps your entire life is predetermined, such that everything fits together logically. You never get to change anything. What applies to The Now applies whether it is attached to "the present" or "the past". The alternative: The Now always permits changes, but making a change results on collateral shifts such that overall logical coherence is maintained. Not due to a force, of course - more like tugging on one fold in a blanket of material, and other folds being reshaped as a result due to it being a single landscape. Some of those "folds" might be your personal memories...

The reason why everything is predetermined is not in spite of our choices, but because of them.

This is almost there, I'd say.

So, what is free will? Free will is the ability to reshape information. However, this must inevitably occur either outside of the information landscape and by "operating" upon it, or by being the information landscape and "changing shape". Now, this is obviously getting us into "consciousness" type territory, but we can maybe put that aside and ask ourselves the question: Is it possible that past-as-information is here right now just was much as present-as-information is? And it's just that present-as-information is currently unfolded into the senses as a "moment of experience", whereas other "moments" are dissolved into the background?

If this were so, then free will could operate on any part of the information landscape at any time. This gives us a mix of determinism and freedom: the landscape is deterministic, yes, but it is only deterministic between updates.

This gives us:

- If the information landscape is deterministic.
- If the information landscape contains all moments.
- If the information landscape is always coherent.
- And if the information landscape is changed by our free will, updated to a new deterministic form.

Then we can indeed have the experience of "going into the past and changing it". What we would be doing is temporarily unfolding another ("past") moment, updating it with our free will thus shifting the landscape to a new deterministic state, and then unfolding our present moment again. The coherence rule would mean that logical sense would take care of itself. However, it might also mean we don't retain memories of the change.

Q1: First, I believe we disagree on the definition of free will. Reconciling that would be difficult, and its discussion would be extremely tangential. I don't see free will and determinism as mutually exclusive. I don't think they are competing forces. I believe that a choice made is a choice free, even if that choice was is predetermined. All choices are free choices, even under compulsion. We can speak further on this, but I just want to let you know that this could potentially open up Pandora's box. On another note, your unfolding of histories approach is very interesting. However, it seems to me that each separate deterministic state put together creates one massively determined multiverse. I know that seems like a logical fallacy (a parts-to-whole composition fallacy), but wouldn't each separate deterministic state have to be self-consistent, so that when you attempt to understand the whole of all the deterministic states, they are altogether predetermined?

Let's leave the free will issue floating for now because, as you say, it's going to get pretty tangled pretty quick, and I think we may find a way around doing that if we continue along the other path - because we will perhaps connect "information radius" (what falls within your perspective) to free will and "first cause". Anyway...

So, we might shortcut the histories part and just propose the following:

1. That there is an eternal structure which contains all possible self-consistent states. In this sense, it is fully-determined, since it is unchanging. It is a sort of "infinite static gloop" of all patterns.
2. That a conscious observer selects out a world-state from that structure, in way analogous to an observer scanning their 2D attention across a 3D room. That world-state is a fully determined 4D structure.
3. That a conscious observer's apparent unfolding experience is equivalent to them scanning their 3D attention across that 4D structure.

In this way, time travel would be a discontinuous shift of the observer's 3D attention to another part of the 4D world-state structure. However, they wouldn't be able to change anything in terms of content, they would just be shifting their experience. In order to change anything, they need to shift state. (There are issues regarding identity and memory here, but they are best put aside initially since we're moving away from what we usually think "we" as an observer are.)

You can probably see where this goes: at first it seems that to gain the required degrees of freedom, the observer has to be 3D then 4D then 5D... but eventually the observer becomes dimensionless and unconstrained, and becomes the "first cause", whose power of attention or selection ends up being the freedom to change the relative intensities of states within its experience. That becomes the essence of what we might call "true free will" - but it is "outside of" or "before" any structure, just as consciousness is "before" any experiential content (or rather, it ends up: that which structure is "made from").

*Q1: It does seem that we are pretty close, only that I think that we are only a part of one dimension. I do agree, though, that if there are multiple dimensions, as you purport, there has to be some sort memory loss. I do have one more question on this: would you say that someone is only exercising free will when they are shifting into another world-state structure, when they become the "first cause?"

I think that as part of one dimension, we are wholly and entirely free. While, at any moment, I can make any choice imaginable (perhaps one that would create a "first cause" event), but I will only choose the alternative that I would choose. It seems to me that multiple dimensions would create multiple versions of "me." If I time traveled and did something that created another dimension (one where that action happened, and one where it didn't), you would have two separate individuals in different dimensions who are completely alike, minus the fact that in that one very specific instance, one individual would make one decision, and one would make another. They live in alternate realities, one where the decision was made, and one where it wasn't. One with one version of me who is willing to do that one action, and one who is not. But as an individual, I would only make one of those decisions. It follows that the alternate dimension version of me is someone different than me. Therefore, that version of me isn't actually me, for I only make choices that I am willing to make. An alternative dimension of me is not me at all. Why would I make a decision that would make me different than myself? We can probably agree to disagree at this point, because we are both quite close yet very far away from one another. I have sympathies to the view I outlined above, but I tend to lean to the single dimension view with one consistent history.*

We really aren't so far apart at all. The way you might get around those issues, I suggest, is to reconsider what you mean by "me". The starting point is to recognise that you are not in a dimension or world-state, you are experiencing a world-state.

To just jump straight to this -

I suggest that your actual situation is of being an "open aware perceptual space" in which sensory experiences arise. And by "sensory experiences" I mean this full "3D scene", including the room, your body sensations, and so on. This flips things around. You are then no longer "in" a dimension or a state, rather all possible states are "dissolved" within your perceptual space and are available to you. Right now, you have adopted or "taken on the shape of" a particular world-state, such that the corresponding sensory experiences arise as you unfold the "moments" of that state. So here is only one you-as-consciousness, which is the context of all experiences. Meanwhile you-as-body-in-a-world is actually the content of a particular moment of experience. There are any number of those, but they are like frames in a movie - they are "dead" unless an observer gives them life by experiencing them. So just as we wouldn't say that Star Wars contains 100,000 Harrison Fords or Mark Hamills (one per frame in which they appear), it doesn't make much sense to talk of multiple "you"s, except as "moments of experience".

Note - We can directly observe that we are this "open aware space" easily by attending to our current experience in the present. It even makes logical sense from the common notion of how the senses work, although very quickly the philosophical implications destroy the notion of an "external world" as we usually assume it to be.

Q1: It's the experiential part that I don't really hold to.

Could you clarify what you mean by that?

I don't separate experience and body. They are irrevocably linked. You have one body and one experience. Even if your experiential self and your bodily self are separated, there is still one of each.

Okay. So, what would you say is the relationship between the experiential self and the body? And what form does the body take in experience?

The reason I think that's worth exploring is, we have to be really careful about conceptualising things using the "view from nowhere". If our thinking about something involves doing so from a 3rd-person view, then we have to be cautious because if that can never be observed (directly or indirectly) then it can't be confirmed or denied. For example, we might conceive of time travel as "traveling back along a time- line" or "transferring oneself amongst many parallel worlds", but if we pause and actually notice how exactly we are imagining this, we realise we are basically viewing a mental diagram, from a vantage point that can never exist, of something that doesn't exist (in that form anyway). We have to be sure to tie our ideas back to what can actually be experienced directly, or at least recognise our mental fictions for what they are. Otherwise we might as well become string theorists! :-)

It's in this spirit - given that it's fundamental to the idea of "traveling in time" and the notion of "being in the past" - that I feel we really have to pin down the relationship between experiencing and the body (which is really "the world", I suggest).

POST: Meditation and visualization are the key! (see comments) (/r/timetravel)

Usual link: "persistent realms". Basically, entering into an experience (let's not categorise it beyond this) by implying that it already exists and shifting one's attention to it. What you are trying to do, it seems, is to trigger that and then not return to this experience. What I wonder, though, is: given that you could have any experience at all, any apparent world or time, why focus on the "farmer's wife in the 1800s" scenario in particular?

I really envy those who can access persistent realms...

It's not that hard. Start lucid dreaming. Perhaps get Robert Waggoner's book for ideas and inspiration (it's by far the best book on the subject). There are various techniques one can try, but fundamentally what actually works is just firmly deciding that you will have a lucid dream. Donald DeGracia's DO_OBE guide is also worth a look, since it offers a free guide on what amounts to direct-entry lucid dreaming of apparently pre-existing environments.

EDIT - Note to other readers: The rest of this conversation is off-topic for physical time travel, but discusses the sorts of ideas that might form a foundation for mental time travel.

Mmm, it's more that I have mental blocks. I'm dealing with a pretty severe depression right now, and I have little faith or confidence in my powers to do... well, anything, really. It makes doing things like lucid dreaming pretty hard.

Grrr, depression is such a grim slog. Do remember, though, that for these things depression affects what you think you can do, not what you can actually do. For sure, that means it's harder to continue to intend, which can be a big hurdle. (EDIT: Which sounded patronising, but wasn't meant to be. I'm trying to say that you've still got the capability, but you might need to find another angle of attack.)

So, you might find it easier to play with "dreaming in real life" to get you started. There are some interesting exercises in chapter four of Lenard Petit's The Michael Chekhov Technique: For The Actor, for instance. (You can download an excerpt of that chapter: here.) Something you might want to experiment with specifically: "feeling out" into the space above you, in front of you, behind you, including more and more of it into your sense of "presence", and then adding the "volume of space your body occupies" also.

*Q1: Thank you. I'll give the chapter a read.
(Musing to myself a little bit)
It seems to me like our lives can be understood as a person swimming in the ocean. If we just allow ourselves to float, we will drift along with the current, going wherever it leads us. If we choose to swim, we can direct ourselves, be it with or against the current. Sometimes the waters rage and sometimes they are still, which changes how effective our options are. Depression, however, is not the water, but the swimmer. When we are depressed, it is as though our muscles are tired and weak, and even when the ocean is calm, we spend what little energy we have simply trying to keep our heads above water. The thought of actively swimming seems like a non-starter. For those of us with tired muscles, it seems like we need to find a way to leave the ocean entirely in order to get some rest. But how can we leave the ocean when it is all we know how to experience? I suppose that's why I want to travel somewhere else for a while.
Oh, I know. Nobody asked - but getting my thoughts out there, in public, is helpful for me. Thanks for indulging me and thanks again for the chapter.*

Thanks for sharing that.

In the spirit of musings, a further thought might be that in effect we are the ocean also, but having forgot that, we exhaust ourselves trying to direct one part of ourselves - "the swimmer" - against the flow of the rest of ourselves - "the current". Thinking that we are the swimmer only, we intend and intend and intend the action of swimming towards our goal regardless of the orientation of the current. If we are fortunate, the current so-happens to be in roughly the direction that we want to swim in. If we are unfortunate, the two are at odds, and we become exhausted, constricted, depressed, and hopeless - but with no option other than to keep fighting or to sink, or so we think. Realising that we are the ocean also, however, a new possibility opens up: to intend the current, not the swimmer. Such an approach would be daunting initially, since it would require a large amount of trust - perhaps only at the point of absolute despair would one surrender to it. For to intend the current and benefit from its momentum, one would have to cease intending the swimmer, and allow him to be moved by the water's flow, trusting that it was taking him in the intended direction, without knowing the details of the route, prior to the destination being reached. Practically speaking, what would this mean? It would mean to cease micromanaging the movements of the body and mind, to allow them to move spontaneously and unbidden, releasing one's resistive grip completely after firmly deciding one's target. How to get to that stage? In exploratory steps, through experimentation on a small scale, with unimportant things, until a confidence emerged - likely bolstered by the pleasant lightness that accompanied such an approach.

*Q1: Though they're all fictions and "not true" to an extent, I find that, intellectually, I agree most with nondual views, and therefore I agree with your assessment. The problem I suffer from is that I don't know it, emotionally and intuitively, so during troubled times, I'm prone to regress to more dualistic thinking.
I agree that is very daunting to "intend the current". When I think about doing it, I am already in trouble, because there is no doing it. There is only allowing it. Alas, I am a control freak. I'm always trying to "do". "Allowing" is scary and intimidating. I have always been dominated by my intellectual side. A major factor of this depression is that my emotional and creative side was brought to the surface and forced into the spotlight, and I am having a very hard time coping. I do think I understand to an extent, however. When I "change my personality," I notice the way I "naturally" respond to the environment changes, without any effort on my part. This seems to be in line with what I am reading in The Michael Chekhov Handbook. My issue, as stated, is having my emotions and identity stuck in dualism, so when it comes to "changing my environment," I find myself unable to affect similar changes.
Sorry, this is a little unclear. I seem unable to coherently express myself at the moment. I hope you can understand what I'm trying to say.*

Yes, it's very difficult to put this stuff into language. The problem is, I'd say, that our conceptual thoughts are themselves basically "shadow-sensory" experiences, which of course are formatted spatially and temporally, but we're trying to talk about something which is "before" division, "before" multiplicity - in fact, we are trying to use thoughts and language to discuss the thing that thoughts and language are "made from". It's like trying to build a sandcastle that is a sculpture of "sand".

However, this is also the clue as to what we must (non-)do...

So, have a play with those exercises (and do treat them as playful), but maybe keep this in mind too: the idea of the "unbounded thought" as being what an intention actually is. By this I mean, a thought which has no edge, that is not an object, that is the abstract thought of something being true. Doing this, would be to simply bring into prominence a pattern corresponding to a particular fact, across and dissolved into entire "open perceptual space" that you actually are, such that it is incorporated into all subsequent experiences. (The basis here: your direct experience of yourself is of an "open aware perceptual space" in which your experiences arise, as sensations, perceptions and thoughts. It is in this sense that you are both the swimmer and the ocean; they both arise within this same space.)

As we've been saying, this can't really be described, and attempts to do so make it seem complicated when actually it is super simple: it is the assertion of a fact as being true, while not suppressing the shift in experience which results. Now, you might call that second part "allowing", but I would phrase it as: no long engaging in the bad habit of asserting your current position all the time. To me, this second part is a key to breaking free from depression, although I understand that it can be daunting, because it means no longer suppressing the movement of that emotional and creative side.

A final metaphor can be: think of yourself as a shape-shifter who changes the shape of their own perceptual space, by simply intensifying the contribution of one pattern or another, via asserting or intending or unbounded-thinking a particular fact. Once you have become the new shape, the world within you, arising as sensory experiences, will naturally be of a corresponding form. That's probably not particularly clear either.

Q1: I'll give it a try. I'm having no success at all with any of these exercises, but I'll try to avoid taking them too seriously. (One of my issues is that I grow frustrated very quickly when I am new to something. Once I establish a beachhead, I have confidence to learn without stress, but establishing that beachhead is very frustrating to me). I suspect that getting too emotional about failing would just be counterproductive (more than usual, I mean).

It's understandable, but remember that there's nothing to "get right" here. If you think about the context in which these exercises are used (which is in actor training over an extended length of time; they just so-happen to be instructive for pointing out that you are an "open perceptual space"), then you'll realise they are "exploratory". Literally, it's about imagining that things are true and allowing the imagination to take over, and seeing what it's like to let that happen. If you are unfamiliar or uncomfortable with that at present, that's fine, it just means it'll take a while for you to feel your way into it. That "feeling out" time is not wasted: it actually is the progression you are seeking, towards your goal.

As an aside, I really would emphasise that probably the most valuable thing we can learn is the attitude of "being okay with whatever happens". If you need a reason for this, it's that you cannot know in advance what the experience of getting what you want will be like, particularly if there's an extended period of time over which it emerges. You have to accept that you can't know what you haven't yet encountered, and be okay with not getting what you incorrectly assume is the right result, right now. So don't be disheartened, actually embrace with curiosity the experience you do get, and that includes the odd feeling that comes with the frustration of apparent non-experiences.

Q1: I've been giving it a little more time, and it feels like nothing is happening. My (physical) arms don't move at all with the first exercise. I feel none of the energy in the second exercise. Trying to look with "new eyes" feels like I'm just trying to imagine what's behind me. I know you said to try not to be disheartened, but it's really difficult. It's hard to fight the emotions that tell you that you are so unhappy and never will be happy ever again, and that even trying is not worth your time, because you have no power to do anything.
Bah, I'm being so gloomy.

Hey, gloomster! ;-) It's only one day since you first read the exercise! However, it's very possible that you are very narrowly focused right now (in terms of spatial attention) and what you are doing is "trying" to do this from "over here". And it's rather hard to describe openness to you. That might not make sense yet. But...

Firstly, did you try the "feeling out into space" exercise I suggested? That's where to start. Give that a go first. Try that now. Secondly, depression is often "located" in the body volume somewhere. You can find it and sit with it. So, pause for a moment. If I asked you, "CC, your depression is situated in a specific location right now, where is that?", how would you reply?

This is probably the wrong answer.

There can't be a wrong answer, because there's no right answer! To emphasise: you can't be right or wrong when exploring the content of your experience, you can only be more informed. On the "feeling out into space" one, forget the book's version, and for now, and don't try to obtain any particular effect. You are seeing what's there, you are not trying to make anything in particular happen in this case. So, try this: as you are reading these words, your attention is somewhat direct towards this screen. Now, pause, and direct your attention to "the place you are looking out from". What do you experience in that direction? What's there? Say what you actually experience, don't "work out the answer" or think it out.

On the depression location, what can happen is that it's diffuse, and then after scanning, it often seems to "condense" into a location. Doing that is a bit more involved, but I thought I'd just see whether there's a particular place that was noticeable to you. Have you ever explored lying down on the floor and totally giving up all control - for, say, 10 minutes - to see what happens?

Q1: Now, pause, and direct your attention to "the place you are looking out from". What do you experience in that direction? What's there? Say what you actually experience, don't "work out the answer" or think it out.
I felt... addled. I couldn't do it for long before my intellect started inserting concepts, but it was a peculiar, unsettling feeling.
Have you ever explored lying down on the floor and totally giving up all control - for, say, 10 minutes - to see what happens?
I've tried this in the past in bed. Perhaps I'll give it another go.

Good stuff. Okay, here's my suggestion for you. Do these two things, as described below, for a week. There's nothing to achieve in doing these two things, and there's no right or wrong way to do them or to experience them. There is nothing to work out, nothing to conclude. This is not for anything. Simply doing them is sufficient. Here they are:

- **Two-Way Looking:** Whenever it occurs to you to do so, perhaps while walking, or traveling, or just sitting around, or watching TV, or reading, or talking with someone. Whenever it happens to occur to you, while noticing that your attention is on whatever you are engaging with, also direct it towards the "place where you are looking out from". In other words, you are still doing whatever you are doing, but just become aware of that "place" too.
- **Daily Releasing Exercise:** Every day, for 10 minutes, lie down on the floor in the constructive rest position: feet flat, knees up, hands resting on abdomen, a couple of books under the head so that it feels supported. Lie down in this position and give up, play dead. Give yourself to gravity, the universe, whatever. Let go of your body, your mind and - particularly - let go of controlling your attention. Allow your body and mind and attentional focus to shift and move however they want. And if you happen to notice yourself "holding on" again, gripping anything, just let go once more. Now, sometimes you might find that your attention narrows on a particular sensation, which then intensifies, peaks, then releases, after which your attention opens out again. That is fine. Just let that happen. Let anything happen, for those 10 minutes.

So, I'm recommending you do those things, and I'm telling you that they are inherently good, even though you shouldn't expect any results from doing them. Regardless, you should do them. And not bother thinking about them at all.

How important is the position when I'm lying on the floor? The first time I did it, I was in more of a starfish position. The constructive rest position feels a little less comfortable to me.

Yeah, it's likely to be less comfortable initially, because your body is stuck in a non-optimal habitual shape due to accumulated tension and thinking ("stuck thoughts and incomplete movements"). The constructive rest position corresponds to the "ideal rest position", such that any deviation from it is hard to hold against gravity, and this encourages a release towards a state of zero excess effort over time. That's why we do it on the floor rather than on a sofa or a bed, which would tend to mould to, and therefore maintain and persist, our existing bad habits, rather than lead to a relaxation of them. In particular, lying on the floor like this puts your lower back in the correct relative orientation, which is something hard to do "deliberately".

So: definitely stick with that position. It will become comfortable in time, and you'll start to notice that everyday movement becomes more comfortable in step with that. If you are having trouble because your knees want to fall to the side, consider using a tie or belt to hold them together for now.

Will do. Thanks for your continued advice.

You're welcome.....Screw others' judgement, that doesn't help one way or the other! You'd be surprised at how little anyone gives a crap anyway. And if they did, so what? :-)

I'm having a very hard time "releasing."

So, remember, you are not actually meant to be doing any releasing. You are also not trying to get rid of any thoughts. This is not meditation; there is no skill involved here and nothing to get "better" at. Literally, you are lying down and "giving up" for 10 minutes - and, when you notice you have become focused on something, giving up again. There's is nothing more to it.

Therefore, to motivate myself to do things I want, I need to engage with what makes me upset.

You can't keep going like that. It'll destroy you.

If my mood is fine, I tend to waste all my time being distracted with pointless crap which is out of sync with my desires.

Then perhaps they are not really your desires at all; they are things you have taken on as obligations or should-wants. Surely your primary desire would be to become capable of feeling relaxed and good in every moment? Otherwise what is life for? A life full of feeling miserable but "achieving" things that you will never enjoy? So it would be silly to postpone feeling good, for the sake of achievements. One of your targets should be: to achieve feeling good while working towards achievements! ;-)

I'm just spilling my guts wherever. Hope you don't find it weird.

That is not a problem! It's how we should be, when the opportunity comes up.

Now that I've experienced real, proper, strong emotions, I feel empty when they're not present, even though the emotions are negative.

Eventually that emptiness will turn into a fullness. You've probably had quite narrow attentional focus for a long time, which excludes most of your body space, so you only notice your surface feelings. As your release into your larger space, at first it might feel sort of open-empty, but eventually it will feel full-alive. There's nothing you can do about this; it's something that you open up to allow to happen by itself. For now, refrain from any inclination you might have to slightly manufacture situations that give you strong feelings to "make you feel alive"; refrain from tinkering with things other than doing the couple of things.

The first relates to comfort - once I've been lying there for 12+ minutes, it starts to get somewhat painful.

The solution: just do it for 10 minutes, as it says in the description. :-) But the pain is to be expected - see later.

I'll try to release that sensation, but it doesn't really seem to work.

Just to emphasise: you are not meant to be releasing anything, you are not meant to be doing any releasing. Your job is simply to lie there, and let whatever's going to happen, happen or not - by itself. You cannot force progress here by effort - because "effortful forcing" is exactly how you develop a bad mental-postural state in the first place. Basically, it comes from the long-term approach of intending, say, muscle tension in your body (tensing your leg muscles to push yourself up from a chair) rather than intending a result (intending to be-stood-up and letting it happen). Doing the releasing exercise will gradually return you to the correct, open state - with increasing freedom of easy in movement, thinking and perception. All by you doing nothing at all!

To what extent does adding some amount of padding work against the exercise?

Don't use padding - it's just supporting your current posture. It is natural to feel sore after a while, because the accumulated tension in your body is leading it to try to hold parts of itself in mid air, against the force of gravity. Gradually, those muscular habits will give out - release, in other words - and finally that position will become the most comfortable one ever. In other words, occasional pain is fine, it's another example of where you just let things rise and fall in experience. Example - You're feeling fine, then a pain appears, it intensifies, your attention narrows on it, it gets stronger, peaks, then releases, and your attention opens out again. All of this happens by itself, so long as you don't react and obstruct it or attempt to control it. It happens differently for different things - there is no "right way" - so you can't control it because you can't know what is "meant" to happen. You are a mystery to yourself! :-)

Remember: This 10 minutes is about giving up control and being okay with whatever happens.

Also, should I do it when there are fewer distractions (such as a television on upstairs), or do they help the experience?

It's probably nice to do it when it's quiet and you feel you won't be interrupted. However, if there are background noises, that's just another thing where, should you find your attention narrowed on them, its a remind to let go of attentional control again, allowing it to open out. To emphasise here: You should not treat the releasing and the two-way looking as things that have specific results or targets to be achieved. You do them simply to do them, and in fact they are a non-doing, since whatever you do effortfully blocks them - like trying to make a pool of water clearer by brushing the ripples away with your hand!

...So, your creative side has burst open, and is aching to play, but that means the chasm between your current circumstance, and where you want to be now, is laid bare. Okay.

I do agree that it all reduces, more or less, to "maximize positive emotions and minimize negative emotions."

Yeah, perhaps, but it's not something you do deliberately as such. Really, for the releasing exercise, just treat it as a habit you do every day, without expectation. It's only 10 minutes, which you can treat as your daily time to "let the engine cool off", like when the metal chassis of a car going "ping! ping!" as it settles back into shape - or whatever metaphor you want. The side effect is that gradually your sense of space will expand into your body volume, and beyond. You will be more in touch with feelings and the felt-sense of intuition and your creative sense. But you can't "do" this, you just have to let it happen. All you need to do, is do the daily exercise and get better at not micro-controlling yourself and the world, if you find you have a tendency to do that.

I want to learn writing and other artistic pursuits.

Related Top Tip - If you centre your attention in your lower abdomen, that's where that "global summary" sense is, and is where you "rest" with your attention when you want to understand something in a general way, or when you want to explore things creatively. You can't make it do anything, but you can sort of "ask and receive" in that area. (Which sounds a bit vague, but it's hard to describe because you do this by just "feeling out".)

Yet, I've always had an inner desire to draw, to write, to make music, to dance, to act, etc.

Have you begun doing that now?

Any moment you're not doing other stuff, and time you sitting feeling miserable, redirect yourself toward an artistic project. Mood is posture, to an extent - you can't work your way through misery, it can't be solved; you just have to "shift state". So: think up a project. Or pick an artistic area and ask me to invent a suggestion for you.

Books some people find useful:

- On Not Being Able To Paint, Marion Milner
- Constructive Living, David K Reynolds
- Stop Thinking, Start Living, Richard Carlston
- What is Zen?, Alan Watts

I have a very hard time with failure and being unable to do things.

You want certainty in advance. To know what's going to happen, before you experience it happening. It's a pretty normal tendency but, as you note, it doesn't work. It actually doesn't work very well for technical subjects either; it's just that since they have a greater level of "knowledge retrieval" than the arts, it can seem like you are solving things by trying hard, when really you are obstructing by doing that. So, that was an interesting article, and I think I went through something of that sort myself. As

you've already realised - it is now way to live your life. Even just because it's based on a lie: the lie that you can deliberately control creativity, and that the "intellect" is a cold hard serious mechanical thing. But a moment's thought shows that this cannot be true: it would require you to be able to "pre-think" your thoughts. In actual fact we feel our way through problems. And even more importantly, we rely on an autocomplete function.

Specifically, the way to solve a problem is to assert or declare that there is a solution - this is like creating a sort of placeholder or reserved space for it - and then your mind will autocomplete the path from the current situation to the solution. This is a creative act, a "letting-happen". And this is always how problems actually gets solved: after all that mucking around and thinking and worrying, the answer appears. This means that "we" do not solve the problem. We set an intention, and let "creativity" fill in the gaps. Obviously, this is rather contrary to the notion of being a clever person who uses their intellectual power to solve things, and is in control. Fundamentally, it involves the realisation that one cannot take credit for being clever at all. You-as-person are not clever, you simply have the ability to "allow cleverness to arise". It pre-exists, you just clear a space for it.

I'll admit, I'm not very good at centring or focusing attention.

Well, it'll clarify over time. It's not really about spatially focusing your attention in a narrow way; you might think of it as "including" that part of your experience and allowing yourself to "rest" there, to be slightly more there than you are in your head area.

as I'm working, some negative emotions pop up and I feel an overwhelming urge to go lie on my bed and "be miserable," or something.

You need to not do that. However, there is something to this: there's the idea that a ripple in a glass is a big deal, but a drop of water in the ocean is no great shakes. What you want to be is "an ocean" rather than "a glass". By doing your daily releasing exercise and, eventually, allowing your attention to open out and expand into the background space, you'll find that those feelings and urges are a smaller part (spatially speaking) of your experience. Which leads to a couple of things:

- When such feeling come up, do you focus down on them? Don't do that. Allow them to be there and instead try to include the sense of the space in the room around you.
- As a general exercise, it is good to occasionally pause and expand your sense of "presence" into the room around you, in all directions, and beyond. This makes you "an ocean" rather than "a glass". (I've mentioned this before, but it's a really powerful exercise.)

That feeling that you have no power...

If you have become localised, attentionally-speaking, in your head area, you will feel powerless. Do try to expand your "presence" (your inclusive attention) into that abdomen area, and maybe work on "moving from" there. For example, if I was going to get up out of my seat now, rather than messing with my muscles, or reaching my attention out to where I want to be, I would instead: keep my attention rested in my lower abdomen area, and move that area to where I want to be, allowing the rest of my body to follow by itself. Try it; it's nice. (The "expand into the room" exercise also makes people feel more powerful, often.)

One thing to perhaps check: Are you trying to do things from inside your head? For example, if you move your arm, do you try and do it from your head area, rather than being "in your arm" and moving that? Some people who intellectualise a lot end up in that situation, because they have absorbed the idea that the "brain" is the control centre where they are. But of course, that isn't the case. The "arm move the arm", the "leg moves the leg". There is simply "arm movement"; there is no "something" that moves the arm. Explore this.

Thanks for your continued patience with me. It should be clear by now that excessive intellectualizing, as well as the whole "not doing" thing, is a serious stumbling block for me.

Seem to me you're making good progress, simply by being self-aware and contemplating these things. It's hard to describe this level of experience in language, but we can feel our way into it. You just have to guard against not being able to accept that things aren't immediately solved - because that's not how life works. You have to be okay with how things are, and allow them to unfold by themselves. There are no "problems" and "solutions" as such, there's just an ongoing evolving experience, where one turns into the other. If you are okay with the tension of anticipation, if you can accept the mystery aspect of life (that you can't know what you will experience prior to experiencing it), then the tension will drop away. This does take a level of "trust" or whatever - but you can build that up.

That's why I suggest it's good to start working with the body and being aware of that. First with the releasing exercise (which performs a good in all areas), and then pursuing the idea of "intending" solutions or outcomes and then "allowing" them to unfold by themselves. This can be applied to standing up from a chair, taking an amazing photograph, or solving a physics equation.

A thought: **You can't "solve" life, because it is not a problem - it is an experiential landscape.**

...All-nighters, grim stuff, I've done my share, not overall fun, I sympathise!

It's as if it is given to me, and it is my duty to record it.

That's a very eloquent way to put it. Excellent. Yes, that's exactly what this is all about - and for not just thought, or when we pause deliberately, but for physical movement too, and more generally, as part of a flowing unfolding.

Second, I still do have some lingering skepticism about all of this.

Well, that's just fine and appropriate. These things aren't to be "believed", they are to be explored and experimented with. All that's required is curiosity, a sort of "what if" frame of mind, and just an interest in discovery and creativity. And it's the perfect thing to do in conjunction with artistic projects: the two things will dance together nicely.

I've yet to experience any sort of "expanding beyond my body." Still trying too hard, maybe.

Well, I wouldn't worry about that. Initially, it might not even make sense about the "not doing it from here to over there" thing. You can't really think about it actually - but over time your attention will loosen up and open anyway. Just maybe occasionally keep in mind the idea of: "what would it be like to feel as if I were the entire space of this room?" - but then don't try to answer it.

I'm still very much not sure exactly how this would feel if it were achieved.

That's fine. Being sure of this would be like having the experience of it before you've had the experience of it! Remember that by "the presence" I mean "you". So, if you are finding that you are focusing that "you-attention" somewhere, okay, go with that: then play with making that sphere of attention larger in diameter, even if it's "over there" at the time, until it expands up and includes "over here" too. Again, not to worry: just something to play with, and it'll come in time.

When I move my arms or legs, they just... move. The "commands" to move don't feel like they're coming from anywhere. The "commands" don't even appear to exist. I'll try to explore it further... somehow.

You've nailed it here. The "commands" aren't anywhere and don't seem to exist. And yet you know that you do the movement, don't you?

It's like you are shape-shifting, you change state from "arm being in this position" to "arm being in that position", by simply becoming the latter, by simply "deciding". But there is no sensory aspect to that deciding.

Problem is that there are a hell of a lot of cliffs and rocks and dangerous beasts on my landscape.

They will gradually unfold into the sunny field! But you have to transition from this state to that state - the problem solves itself, but the transformation still arises as an experience. Every time you allow the you-and-the-world to move by itself, such as in your daily releasing, that resolution continues, and gathers pace.

*Q1: All-nighters, grim stuff, I've done my share, not overall fun, I sympathise!

It had some odd effects on me. When I was lying in bed around the 35th or so hour, I closed my eyes and the black you see when your eyes are closed started to move. It wobbled back and forth before it began to rotate like a cube. I could make out distinct "edges" and "faces" (as in the face of a shape), even though it was all still just black. I've never seen something like that before, and I'm have no idea what it actually was. I was reading some more of DO_OBE, and he talks about the "ideoretinal light" being something you really, actually see, and not just something in your mind's eye. I wonder if what I saw had to do with this. The other effect it had on me was that it completely drained my emotions. When I finally got asleep, I slept for a good 11 hours, but my emotions didn't really come back. I haven't been flat out miserable like I was before; I've just had this passive, low level sadness that leaves me feeling very empty and unmotivated. In a way, it's actually worse, because when I was extremely sad, I at least had some motivation to try to do things to resolve my sadness. Now I'm not motivated to do even that. I've decided to go back to reading about lucid dreams and astral projections, but when I come across passages like this:

There are two things you are doing here. First, you are admitting to yourself that astral projection is a real thing. This is very important because any skepticism you have will only prevent you from projecting. By telling yourself that astral projecting is possible and that you will do it, you are opening up the possibility in your mind. Like anything else, you have to believe a thing is possible to do it. ... I hate to say it, but you just won't be able to astral project if you have a half-ass attitude about it. Astral projecting is not achieved by the half-hearted or the casual. Along with practicing the right exercises and developing the right attitudes and understanding, you have to really want to achieve the experience.

...I just feel discouraged. My experiences have led to me developing almost a sort of anti-confidence (where I genuinely believe that anything that makes me happy will just hurt me in the end, and that thinking I can actually achieve what I want is vanity), so reading something like that makes it hard to even try. I won't give up, though...

Just maybe occasionally keep in mind the idea of: "what would it be like to feel as if I were the entire space of this room?" - but then don't try to answer it.

Alright. I've found "exploratory thoughts" like these helpful. Do you have a list of more?

Much of this seems to come down to "keep exploring and the resolutions will come." As I said, I have very little faith that that's true... but I'll keep trying. It's not like I have anything better to do.*

Your after-all-nighter experiences sound like hypnogogic imagery. Typically, as you drift into that intermediate zone, the black space behind your eyelids becomes 3-dimensional, and sparkles turn to fragments turn to images. If you stick with it, you get a scene which then wraps round to become an environment - and, hey, you're in a lucid dream. So, don't worry about the "belief" thing. I think it's a very misused word anyway. The way in which beliefs (believing that something is possible) affects things isn't in a causal way. What it does is, limit the extent to which you will commit yourself to something, and the extent to which you will trust in something and so not interfere with it happening.

To ponder: If you have never done something before, what is it that makes you commit to it until you achieve it? Nobody can have your experiences for you; the only option is to pursue them through your own dedication. More exploratory thoughts. Perhaps also ask yourself these questions and see what comes up, unprompted. If there were no limits, in terms of the "flavour" of your experiences:

- How do you want your life to be?
- How do you want your world to work?

Allow fantastical types of answers to appear, if they want to, and don't resist any feelings that come with the answers - allow things to take root if the want. It is for you to receive this, not to mange or shape it, or intellectualise it.

...Why "thinking and worrying"? You'd be surprised to the extent you can skip-to-the-end when it comes to known problems. For multi-step unknown problems, of the type that often arises in mathematics, computing and physics, we have to draw a distinction between intending to have a solution and then "experiencing solving the problem" (fine), and haltingly intending each step (less so). You don't "do" the solving - rather, you sit with the solving experience, when drawn to do so, as a result of having intended the solving. (Yeah, it gets a bit tortuous in the phrasing here.)

I guess we get into difficulties here with what counts as "doing" something. It might be better phrased as: while you don't "do" the solving, you certainly have to provide space or in some way "allow" the experience of solving to arise unobstructed (and in particular: not reset it by re-asserting the problem state again).

...

Q1: Alright, I tried it. I'm not sure quite how long I spent on the ground. For the first few minutes (I'm guessing at the time here), it didn't seem like much was happening. My shirt was buttoned up a bit too tight around my throat, so "I" undid the top button. "I" is in quotations because the locus of control felt... different. Not sure how to word it. After a little while longer, my eyes became very heavy. I let them droop and continued to just lie there. At one point, my head tilted back slightly and my shoulders squared up a bit. I have bad posture, so the position my body moved itself to felt foreign to me. This was probably the most "automatic" thing I felt. Aside from that... it was just little involuntary muscle spasms and thoughts. Near the end, my hands and feet started getting quite cold. Is this a typical experience?

Sounds interesting. :-)

So, do that every day. In my other comment I've suggested committing to it for a week just to get you going with it, but really you should just keep doing it forever. You'll want to anyway. Note that there's nothing special about the exact amount of time, but 10 minutes is all you need for a session, and there's no problem with doing it more than once a day if you like, or before performing some task, or whatever. I figured you might have bad posture. Don't worry about that. Your body will take care of that for you eventually, in its own time. Other changes will occur. They will all be good. Again, don't bother thinking about any of this.

Q1: Alright, I'll try to remember. I'm pretty bad at forming habits, but we'll see how this works out. Thanks.

That's okay too. No need to even try. For both things, just do them when you remember to. If you forget for a while, that's fine, no problem. Just whenever it occurs to you. But do do them then. As I say, there's no pressure here because there's nothing specific, it just about whatever it turns out to be about. However, it will be interesting, and it will make a difference. ;-)

...

Well, I suppose we're going to drift off topic here, but let's explore, since it's still pertinent to the subject of why people want to time travel even by more "traditional" methods. Firstly, what makes you say that? And then: do you believe in reincarnation of some sort? (Not necessarily in terms of religion, just in the sense of a "continuing experience" or similar.)

...Not intended to be loaded really, since I have no specific opinion on it, just interested. "Just knowing" is as good a reason for something as any - in fact, probably better than some logicked-out, post-hoc intellectual justification. After all, when we desire something, it isn't really "because" of anything; we just do. My thinking on the "reincarnation" part was: if we go on forever, if experiencing just continues, then any type of life we have is temporary, and that perhaps makes a mockery of "belonging" somewhere. If I switch into the experience of (say) being a filmmaker in the 1970s, that might be a lot of fun, but it'll pass. That's no reason not to do it, though: the point is that there's an experience I desire that is not available in my current context. But the idea that I would inherently belong in one context rather than another, is hard for me to imagine, since I feel myself to be independent of the particular experience or time.

I suppose it's both simple and extremly complicated.

Yeah, everything seems to be like that! :-) There's someone else who has been experimenting with the same idea - maybe check out his posts, see here. Probably he saw Somewhere in Time too. Just remember to empty the coins from your pockets.

POST: Perception, reality, time travel and temporal dysphoria (/r/timetravel)

So, when you have that experience, are you "you-you" but in that time period? Or are you adopting the perspective of someone else who pre-exists in that time period?.... So, if you had "snapped in" to that experience - basically, detached from this experience completely and hadn't come back - how do you think things would have continued from that point?....What I was wondering is: If you appear as "you" in that environment, do you expect that you will have a plausible history for being there? In other words, **a**

/u/woowho-vintage in those circumstances would already be there and you'll just be picking up that perspective experientially from a certain point? Or do you think you will have just appeared from nowhere?.....Of course, it may be optional. So, given the choice you would prefer to have the equivalent of a memory wipe? But then surely you wouldn't appreciate your escape, so to speak?.....See, I think I'd want to know. Definitely. The memories that are painful now, say, or rather the life that was painful now, would not be painful afterwards. The knowledge would enhance the experience, and one wouldn't take the new circumstances for granted, even which they were relatively hard (due to relative lack of comforts as it would be perceived by today's society in general, and so on).

.....Well, my comment wasn't meant to be for or against modern society, more that having the knowledge that you were no longer in an era that didn't agree with you, might be good knowledge to have. (You would "know you were born", so to speak.)

Well, screw logic in these cases. If it can be made to happen, then the logic will come after. Nobody knows how this all works, because anyone who had the experience of doing it probably chose to have their memory wiped, it seems! ;-)

I quite like the metaphor of Lines of Thought for describing our ongoing experience. If a person did have a discontinuity in experience, a change that stuck, then one way to conceive of it would be as one line of thought (this one you are experiencing now as your surroundings) fading into the background while another one (the sensory surroundings of your target experience) brightens and becomes "3D-immersive", filling their perceptual space.

POST: TUTORIAL: How to travel through time (/r/timetravel)

[POST]

1. Exist
2. Don't not exist
- With my proven steps, you'll be traveling through time in no time!

[END OF POST]

Q1: Joke? Either way, it brings up a good discussion: subjectively we're observing the world at 1 second per second. Our physical bodies aren't actually traveling through time, we're just observing the continuity between two states that are similar. But does that actually count as time travel? If not, does 'mental' time travel count? Does traveling slower/faster through time due to relativity count as time travel?

Q2: Kind of a joke, but yeah, it had meaning
I feel like existing as time goes on counts. You're right that our physical bodies are just observing everything transfer from one state to a different one and then again and again and again. It's stuff like this that convinces me that time travel won't ever exist other than the fail-proof method in the OP. Time is kind of a silly man-made concept to explain something very complicated.
So, yeah, the post was a little jab at the idea of time travel.

Or, a silly man-made concept to explain something very simple. Your main paragraph implies that "our physical bodies" are somehow independent of the states? I suppose they might be, in the sense that "physical bodies" are a concept rather than something we ever experience, but probably we'd need to be explicit about this. There's also the hidden assumption that "sensory experience = state", with every passing moment being a state change - rather than a state being a fully-defined deterministic path, for example, with "time passing" being a static pattern that is a part of that. This doesn't seem particularly useful. In other words, it might make more sense to have "states" be at the granularity of "timelines" rather than "moments".

POST: Theory on changing the past (/r/timetravel)

What if everything has already happened - but I really mean everything has already happened? A vast sea or grid of eternally existing moments? Absolutely everything? And the "timeline" you talk about doesn't belong to "time"; rather, it belongs to you, where what "you" are whatever it is that experiences those sequences of moments?

In this scheme, the only restriction would be that, between jumps, the sequence of moments you traverse must "make logical sense". Beyond that, though, there are no causal implications whatsoever. "Time travel" then becomes about creating a discontinuity, a shift in the location you are focused on in on the grid of moments.

Q1: If I'm understanding you correctly then that would mean that every possible moment in time is happening at the same time in a parallel universe like area. If that's true than time travelling would not actually be going back in time but instead travelling to a different dimension almost identical to the past where changing anything in that reality could actually result in a drastic change there but not in this universe. It's definitely an interesting theory

Although, we probably shouldn't use the word "happening" for the moments themselves. In this approach, the only thing that would be "happening" would be the movement of your own attentional perimeter passing across static moments (or rather, unfolding and expanding those moments into perception). Similarly, the past would be within you, as part of your selection pattern for moments, rather than in the moments themselves, which would have no particular order. Moments would be like "3D sensory frames" which appear within your "perspective" when unfolded or focused upon. (And your "perspective" would be something like an "open aware space"; you would not be a "person" so much as something aware, which was having a series of person-formatted experiences.)

Q2: This is similar (almost) to my view too. There are infinite ways to get from point A to point B. However our personal grid of moments cannot be infinite. If I'm in Barcelona at a certain moment, there is a real constraint as to how soon I can be at my apartment in Seattle. Therefore our experience has a well defined shape that depends on many factors, but the possibilities of existence may well be infinite for all intents and purposes.

Yes. So, we might consider the "raw" state of experience to be like an "infinite gloop" which contains all possibilities and patterns, all at once. However, as soon as we start adding structure to ourselves - base formatting such as "spatial extent" and "unfolding change", "colours" and "texture" - then we are working with a subset of what can experienced at a basic level. Then, later, when we have "a world", there is a further filtering of the "logically available" next-moments from any given this-moment. Now, these aren't inherent limitations - they belong to the perceiver, while the world-as-it-is has no deep limit because there is no solid substrate backing it. But the deep patterning that constitutes "the world" ensures that any normal everyday intentional act will be like a pattern overlaid upon what is already selected, and so unfold in a "plausible" way - at best, there may be the occasional unlikely coincidence.

For time travel, then, we would be talking about a discontinuity in experience; a sudden shift from this 3D sensory moment to that 3D sensory moment. Our intentional act would need to address the perceiver's "world-pattern" directly, to either soften it to place that act in the realm of the "plausible", or temporarily suspend its logical continuity. This would be possible according to this description - after all, the world has no actual substance as usually thought of; it's a subset of imagery - but it wouldn't be probable due to the strength of patterning, so the intensity of the act required would be formidable.

TriumphantGeorge Compendium - Part 31

POST: Tell us what you didn't like about the ME Sub (/r/Retconned/)

Just to interject:

It's probably worth including a link to the thread where that comment came from, just for context, since it also contains a few other thoughts that might be of interest to this subreddit. (Which I'm fairly supportive of overall, I might add, regarding its idea of providing a place who want to adopt a particular perspective and run with it.)

[https://www.reddit.com/r/MandelaEffect/comments/4sr6s0/wheres_new_sub_post/d5bswdx?context=3]

Note that while it's true that I don't share a belief that MEs/REs are "necessarily dimension hopping", the reasons for that are more subtle than one might assume, in that I think it might be missing the point, rather than be wrong. After all, I also moderate other non-mainstream subreddits which encourage pushing at the limits of our assumptions, so it's not like I'm exactly a major promoter of the default story when it comes to unusual experiences!

Are you the guy who started the mandelaeffect sub? Because I remember a thread by the guy who started it...

No, I joined as a moderator quite late on. Was asked to help out when the subscriber count exploded and things got totally out of hand due to mentions in the media and in the default subs. (I did a redesign, wrote a proper sidebar, set up filtering, helped do a troll purge, that sort of thing.)

Was there a reason given as to why you specifically were asked to help moderate, notably above many other much more active contributors?

As I remember it, I'd just done a tidy up for /r/glitch_in_the_matrix and in a comment thread I made some suggestions for getting the place under control along the same lines. So that involved a new sidebar and definition and rules, making /r/MetaMandela as a place where all the nonsense could go, and so on, and then doing a purge of all the trolls that had invaded from elsewhere. Following that, I've not had a whole lot to do with ongoing moderation other than keeping the tech side up to date, sharing thoughts occasionally. I wrote the current experience-focused definition to try and have the subreddit be "explanation agnostic" - in any direction. I can't really speak to its enforcement though, except in cases where I've picked up on reported posts myself or whatever. But I have to say: it's not an easy subreddit to moderate without it having an official view and having 10K subscribers. Which is why this might fare better for those who share a perspective. In particular, it'll maybe have less of an issue keeping it on topic (reports of experiences, suggestions for models and mechanisms) and avoiding it descending into a constant "us vs them battle for truth" narrative where people just fight from a group perspective rather have a discussion. I think the sub gets messages from all "sides" complaining that they are being penalised for defending themselves (the answer being, perhaps: if it's got to that stage, the thread is pretty much already ruined and off topic). Again, I can't speak to your own experience really.

Interesting that you are fairly supportive of our effort at providing a place for those who are taking a particular perspective (that this is not false memory). But there is at least one mod over there who is not taking that stance. I have been banned from commenting, and it seems like the only reason is that I created this sub.

The way I see it is that the /r/MandelaEffect is a general subreddit about the effect - the experiences, the theories, the thoughts about it - but it is not specifically for those who have experienced it or who take a particular view. It's a bit like a forum about "God" where people of all religions, plus atheists and also philosophers who challenge the very meaning of the concept, get to participate. And so sometimes that gets heated because people are speaking from emotionally-charged positions which are sometimes polar opposites. Not always conducive to collaborative discussion! These subreddits, on the other hand, would be more like a "support group" model (loosely speaking). However, you have to be realistic here: the moderators of the main/original subreddit quite reasonably aren't that keen to have people posting to the effect of "this subreddit's shit, come over to our subreddit instead". When the idea was of a private subreddit for deeper discussion, that wasn't a problem so much. When it became a public one also, then naturally people advertising it without selling it as a fully distinct topic is going to be less well-received - it's seen as spam. (One thread fine, perhaps, but the number of "meta" posts was generally getting out of hand, as I understand it, with constant "us vs them battle for truth" narrative posts getting reported.)

It might have been beneficial to almost do away with a reference to the Mandela Effect and the other subreddit altogether - the term comes with so much baggage now anyway - and just go all out for a variant of the "glitch in the matrix experiences involving memory and world facts" definition.

If I ran a subreddit for people managing a disease, say cancer...

Hmm, if cancer was something that you could only know for sure existed when you yourself had it, maybe. The core issue, the thing that causes all the trouble, is that if you've not had an ME experience then there are no other signs for you that the ME actually exists. Perhaps a better comparison would be "enlightenment" or, until relatively recently, lucid dreaming?

But overall the concept is right: that's why I said that this was like a "support group" model - for people who have been through a "trauma" (not quite) that only other people who've had similar experiences can truly understand.

Also, I wouldn't expect the cancer subreddit to feel any need to tell the cancer-denier subreddit what it is up to. Respect needs to be mutual, no?

That is where my suggestion of avoiding linking this too much with the Mandela Effect (the term, not the subreddit) comes from. Then we have two distinct forums exploring "memory-related phenomenon" in their own way. The subreddits themselves stay friendly, and those interested in such things have two distinct venues: a general argumentative "about" one with some baggage (old subreddit), and a specific more "personal" one with a fresh take (this subreddit). This would be greatly helped by not having them link one another, thus tempting one view to "educate" the other? (Speaking off the top of my head there, really.)

The ME sub really has been overtaken by people who have no valid arguments...

I have to say, though, that problem with posts from all perspectives is a lack of detail and solid thinking. That applies to people describing their experiences (they usually don't actually do this, they just announce that something is different), and people attributing to "memory error" or "reality shift" (they don't say how, exactly, it accounts for the details of specific examples). This is one reason why people who haven't had an experience wonder what all the fuss is about: rarely does someone explain it from a personal experience perspective, usually there is an argument in the abstract, which may, eventually result in indignant resort to specific details (by which time it's buried deep in the exchange).

Any intelligent discourse is downvoted and ridiculed. It's pretty disgusting actually. But, it sounds like y'all are fine with it and that works for me...

Well, that's not quite fair...

Downvoting is outside of everyone's control, unfortunately. It might be disgusting, but literally the entire internet can casually downvote any post, unless you go private. It's not okay, but it's also not solvable. The ridicule is not okay either and we try to weed it out - but...

As you might discover here eventually if you're unlucky, if you've got 10K subscribers and mainstream exposure, you end up with tens or hundreds of casual one-off visitors who engage in one snarky exchange. Unless you literally pre-filter every comment, there's always an element of it gets through before someone reports it, or it gets cleaned up. Which leads to...

We will have to continue linking the RetCon name to ME though, not necessarily on your sub, but it's an important part of making people aware of the bigger picture.

For sure - the point I was making was that the term "Mandela Effect" is somewhat tarnished, and that, in fact, is what leads to the bulk of our casual trolls I think. Its baggage also attracts people who have a very specific and heartfelt view of what the explanation is - not false memories, but definitely this-exact-thing - and sometimes that can present an issue too. So I was suggesting that you might relieve yourself of some of the pain the other subreddit endures if you avoid making yourself seem like an "ME subreddit", but rather more like a "glitch" subreddit of which the ME is one possible example (which is the approach the actual glitch subreddit takes, really). So, to finish up on that, you might well find that running a public subreddit is a bit trickier in the details than you might imagine: downvoting can't be prevented, casual trolling can't be prevented in advance, the "us vs them" setup usually isn't as clear cut as it first appears, and unless everyone completely agrees on the details of a subject you usually find that emotionally-charged exchanges to happen and it's often not obvious where the cut-off point should be. (And if everyone does agree, it's often not very intellectually productive of course.)

Basically I'm saying, unless you stay niche, you'll likely find it "ain't as easy as it looks". How would you cope if all the /r/MandelaEffect audience started checking out this place, or if it got the high profile (mentions in the media, mentions in default subreddits) that produces the waves of passing trade that /r/MandelaEffect suffers from? It's worth considering. So: you might want to deliberately make decisions that help keep you low-profile.

I get the feeling you are playing good cop since their bad cop routine didn't work.

Eh?

My point about detail wasn't about your own posts particularly - several posters do take the time to be more in-depth - just an observation that generally speaking people posting experiences rarely take the time to emphasise the actual experience and the specific personal memories involved , and people posting theories (including "false memory" or "confirmation bias" type theories) tend to present a categorisation rather than an actual description or model. For example, if someone has the experience of a map changing, then it's important to say why they think that is so - what they experience of noticing is like, and why they are certain that there is something going on. Like, if you were a geography fan from childhood and had a wall map in your bedroom, used to memorise all the places, always planned to go trips and so on, then one day years later you see a TV programme and the map looks different - hmm! - you look at other maps and they are "wrong" too, then you check out your childhood map and it is "wrong" too. This is not confusion due to different projections and so on!

And most importantly: the detailed description underlines that this is not an example of a "kinda maybe sorta thought it was probably always 'that' way" memory vagueness; you have specific personal memories of events which involve the fact. You get the idea. Meanwhile, do you really think (and I'm not necessarily doubting it, I just want to hear why, if so) that there is some deliberate push to suppress discussion of this sort of thing, for some sort of purpose? As opposed to just the usual contempt people have for things which conflict with their worldview or personal identity, and people on a mission to "defend science" (which is a ridiculous notion, of course)?

For instance, the "guerilla skeptics" which organise themselves to ensure Wikipedia stays "correct" (see her talk here [https://www.youtube.com/watch?v=5FujT9mp0jw], interview here [https://dataskeptic.com/eptnotes/ep012.php]). There would be a difference between this and an effort to "suppress the truth", because the latter suggest there is a truth that people know and are trying to keep quiet, whereas these people don't believe there's anything to it they are just extremely focused on pushing "science" and "rational thought" in sort of abstract way.

Thank you so much for taking the time to engage in a dialogue about your sub. I'm sure some of our readers will find the information helpful. But, as you said, helping to moderate a public sub takes a lot of attention and that's really what I should be focusing on right now. Thanks again and good luck.

No problem, was happy to respond to your points and clarify as appropriate. All the best.

...

Personally, I have never sworn or spoken that detrimentally about the ME sub. I was banned for creating an alternative. And we have moved away from the Mandela name for just that reason. [https://retconeffect.wordpress.com/home]

No, I'm quite sure you haven't (I don't know the background to that, unfortunately). What I meant was, I think it might have been better to not pitch it as an "alternative" at all, and just as a new thing, when announcing it on that subreddit (after messaging the mods of course). It's a bit late now, but I would have happily helped tweak the wording to avoid conflict - beneficial for everyone. It also might have helped save you from the troll/downvoting influx that comes with this. (You should get your AutoModerator up and running sooner rather than later.)

Anyway, what's done is done. I've always quite liked the "retcon" concept in media, and it evokes the idea of "revision" which is used in other contexts, so that's a good choice to build something new upon I think.

POST: Did the Two Cups Intention Method from /r/DimensionalJumping Last Night... and Woke Up Today Filled With Negative Emotions and Hostility (/r/Retconned/)

(Oops, you deleted your post in the other subreddit just as I was replying, so I'll put my response here in case you find it useful.)

You're overthinking this, I'd say. And "spiritual contracts" and "negative vibrations" have nothing to do with this - or, at least, you should very carefully consider what those concepts have to offer in terms of a useful accounting of your experiences, rather than simply accept such ideas at face value. If you've performed the two glasses exercise, then the only result that matters is whether, at some later time, the intended result arises within your experience (or not). It is problematic to attempt to attribute any other experience to the exercise: it can quickly lead to all sorts of superstitious type thinking, since any reasons you come up with are inevitably going to be completely ungrounded in actual experience. That is, you'll probably just be free-wheeling all sorts of vague ideas based on whatever you have previously read, but never actually experienced personally. For instance, do not assume that this exercise is based upon occult ideas or multiverses and the like.

My suggestion: follow the last instruction, let it go, and deal with any specific outcomes as they arise, and not before.

POST: Ever heard of r/DimensionalJumping? (/r/threekings/)

Q1: The interesting thing about it is that if you read their methods, they are just standard magick to get you the things you want. That raises questions: are they interpreting simple magick working as "dimension jumping"? Does all magick work through dimension jumping and we don't realize it? Are they both doing normal magick AND dimension jumping in addition to that because that is the intent? I'm leaning toward the lasst one, because I've never experienced other abnormalities (things being "different" after a ritual/spell), other than the purpose of the ritual/spell coming to fruition. Then again, I wasn't looking for them, so I don't know.

The underlying concept of that subreddit was, in fact, partly to encourage an exploration into whether the idea of "methods" (and related notions) was valid at all. And, from there, to seek to unpack the nature of "experiences" and the nature of descriptions about experiences.

Making a distinction between those two "natures" - and investigating the relationship between them - tends to highlight that taking concepts like "dimensional jumping" and "magick" or whatever as literal independent things might be an error. And so talking about "dimensional jumping" being a version (or not) of a "simple magick working" can be a bit meaningless, if all that is truly meant by "magick" is just a way of talking conceptually about certain sorts of experiences. The basic assumption that there is anything "behind" experiences, and the descriptions can somehow capture that "behind", might be... unsupported.

Which isn't to say that those descriptions aren't useful - for discussion and planning and designing and so on. But they are not "what is happening" (itself possibly a dubious idea). After all, the basic common everyday description of being a person-object located within a world-place (where "the world" is taken to be a "stable, simply-shared, spatially-extended 'place' unfolding in 'time' that is made from 'parts'") is certainly useful. But it is perhaps not really true as a direct experience, when we check.

That "checking" was really what the metaphor (?) of "dimension jumping" was intended to promote, as presented in the subreddit anyway. Note that "metaphor" doesn't mean you can't have experiences that are patterned exactly "as if" something is true; it's just that it is not fundamentally true. Descriptions might not capture experiences, but they might have utility in structuring them. And so on.

Q2: I'm just curious. Why make the subreddit a read only archive? It was an interesting sub until it closed down. The new r/DimensionJumping isn't that active.

That "new" subreddit isn't really even the new subreddit (it's not a continuation).

The thinking behind making it a read-only archive:

The original idea that developed was that the subreddit would be fairly unmoderated in terms of posts, but we'd bash things out in the comments section, via dialogue. So it was basically "moderation by contribution" (of moderators and regular participants who'd been around for a while). This worked well when there was only a few active contributors, slowly increasing. I personally spent a lot of time engaging in quite detailed conversations (in the sense of leading an investigation, not dictating conclusions) and so did many others.

However, eventually (as often happens for niche topics) the subreddit got swamped with users - often via indirect links - who didn't read any previous discussions or the intro material before posting, leading to repeated questions and/or a naive idea of the subreddit based just on its name. The volume meant that the old model just didn't work anymore. That number of pseudo-one-on-one couldn't happen in parallel.

The reason for "archiving" the subreddit rather than letting it just continue, is that letting it run on would dilute the material that had arisen within the subreddit. It would continue its march into a general sort of "new-agey/LOA/magick" hybrid and the residual value would be gone. Better, it was thought, to lock that down, and others could continue their more literal idea of "dimensional jumping" elsewhere - and, eventually, we'd continue the core thread in another forum, with a different approach to moderation and contribution.

POST: 2 cups method question (/r/DimensionShifting/)

If I recall correctly:

Given that the "two cups method" (originally: two glasses exercise) was intended as a demonstration exercise targeting the nature of experience and the nature of ideas about experience, the thinking behind suggesting that one should not do it too often would be that it's best to leave some space to more easily, more accurately, observe whether performing it has a link with subsequent changes in experience -- or not.

That's why it was an "exercise" rather than a "method": it can't really be a "method" until it's been proven to actually cause change. And if it does actually cause change (a view that may or may not be arrived at via repeated, distinct experiments) then there are probably more interesting conclusions to draw other than "let's pour more glasses of water to change the world" or similar. :-)

Q1: I don't think it was u/triumphantgeorge as they have a specific idea about dimension jumping that was more based on the importance of discussion not the reality or fixation on the dimension jumping. I don't recall the post you are mentioning, though I am sure someone wrote something along those lines. Everyday you choose to do something different you are making a jump. Dimension jumping is just another tool. Action of one kind or another is required for you to grow, but the universe always responds to our action.

Yep, pretty much.

Q2: Now that I make you back into Reddit or maybe I just intentionally shifted to a version where you are already back, I wanted to ask you about this exercise of yours. Did you invented this exercise or you take it from somewhere else and explain it with your own words?

I made it up. It was originally written as a quick response in a GITM thread, later slightly tidied up for the DJ subreddit when I fully took that over. It's just an example of pattern-linking really, but it has the benefit of being easily performed plus extremely mundane -- and that's quite an effective combination in an exercise designed for exploring this area.

Q2: Ok, did you still keep that gitm thread, it will be nice to see how it was born, on other note is it connected to Wicca spells. Also I'm curious from what standpoint you are viewing this exercise, from scientific-skeptic approach or from Occultic one or maybe from New age one, I'm pretty much asking, are you believer or not, because you put the label "exercise" and not "technique/method".

Here it is [POST: [EXPERIMENT] Glitch Generation Test, I Need Your Creative Ideas!].

The notion underpinning the DJ subreddit was that it was an environment for facilitating the exploration (experimentation, conceptualisation, discussion) of (1) the nature of experience and (2) the nature of thoughts about experience. No assumptions were offered or encouraged. What is there to "believe" without actually having an experience and drawing conclusions yourself? (Is the idea.)

Also, it's worth noting that the nature of "believing" is another issue all on its own. It's a pretty loose term anyway, but when it is referring to something along the lines of "an idea which I think is true", then the nature nature of ideas comes into play. In particular, the extent to which ideas are (or the thinking of them is) somewhat like a parallel-simultaneous experience relative to the "main strand"; they don't "get behind" our experience or "explain" it in the sense of revealing the underpinnings of it.

Of course, the term "believing" might also, or instead, be used as a word to describe something along the lines of having "adopted a perspective" or "adopted a mental/experiential posture". In that case, one might wonder whether this is something that might be more intertwined with the main strand of experience; perhaps it might constitute a "patterning" of it?

However, these things must be considered and explored; they cannot just be taken for granted because they sound appealing, or because it would be nice if they were true.

(Again, this is the thinking behind the DJ subreddit, and therefore the viewpoint taken in any discussions with "TriumphantGeorge". And it was the underlying approach to the discussion of "glitches" back when I was the prominent moderator and participant of GITM, after having resurrected it from neglect and a lack of "philosophy". It's mostly reverted back to the old ways now I think, unfortunately. But inevitably: it's a lot of work to maintain or even articulate a consistent "perspective" in these subreddits.)

Q2: Hi, I wanted to ask you are labels really needed? Are they just for strengthening your intention or they have a special role in the ritual? Can I just hold the first cup and describe my current situation and for the second cup, hold and set my intention for the change in my mind, then just pour the water? I saw the original post finally and as I see it the original intention was this to be a 'glitch in the matrix generator' and you also said that you have other exercises under your sleeve, did you post them eventually?

For the purposes of this exercise, I would do everything as described. After all, it's only an exercise, not a method, until proven otherwise. If it so happens that you get some sort of interesting results that can be repeated, then you could experiment with changing aspects of it and see what matters and what doesn't. (If you get no results at all, then there's not much point in tinkering with it, no basis for making decisions on what to tinker with.)

Loosely, though, the metaphor to use when considering the relationships between the various parts is: "patterning".

Q3: Great to see you back man. You changed my whole perspective on things at a time when I was very set in my ways. Can't thank you enough!

You're very welcome -- glad I was helpful!

Q4: hey I wanted to ask you something. Is the dimension shifting stuff actually all real? I used to follow the original sub years ago and read all the things you wrote and was a hardcore believer. After years with no results, I eventually stopped believing and thought the entire thing was a hoax and I still do but every now and then I wonder if it is actually real, were you telling the truth?

Not a hoax, but presented as an exploration rather than a declaration of things being a certain way. Which is to say, "dimensions" should not be taken as literal, but rather as one metaphor among many that could be used to explore "the nature of experience, and the nature of descriptions about experience".

The idea was that by experimenting directly you would find out for yourself; you weren't meant to "believe" anything one way or the other. Unpacking things through philosophical-type discussion would then work in tandem with that. (This was clearer if you followed the in-comments discussions, which is where the actual meat of the subreddit took place. Two Glasses was intended to be a "blank slate" starting point from which this investigatory-type approach could progress.)

The closest approximation to that approach now is probably /r/NevilleGoddard: taking a reference concept or text (in that case taking the stories in the Bible as metaphors about reality) and using it as inspiration for a very direct, active, experimental approach.

Q4: I always thought experiencing the "effortless movement" would be what helps with exploration, to show there is something to all this beyond a reasonable doubt. The most I ever got was moving my arm, it happened years ago and I've never been able to replicate it since. Any tips for getting effortless movement, how long should I stick with it before expecting results?
Also one time I did the two glasses on a situation and that very night it appeared to work which shocked me because the situation was unlikely to fix itself. Then I found out a few weeks later it actually didn't work. But then a few months later it ended up fixing itself and working. But all the other times I did the two glasses, it never worked. But it is experiences like that which make me wonder if there is something to all this. But if most of the two glasses fail and one of them works, that just seems like coincidence.

On the first point, don't attempt to manipulate or interact with your arm at all. Instead, bring to mind the idea of your arm being in the raised position (it's fine if you need to use a phrase or an in-place image as a lead-in to this) while having ceased to hold onto your experience of the body (simply: leave your muscles and attention alone).

For the glasses exercise, having it "work" or not is perhaps not the right perspective, since it is more meant to indicate whether there is "something worth looking into, nor not". It's deliberately called an "exercise" rather than a "method" (the whole idea of "methods" is tricky; they are essentially experiences after all rather than causes, mostly anyway).

That it might "make me wonder whether there is something to all this" . . . was exactly the point. The only way to combat "coincidence" is to do something repeatedly and in different contexts. However, it's also worth contemplating what exactly is meant when we use words like "coincidence" or "explanation" or "reason" or "cause", and so on.

Or, indeed, what is meant by "me" and "doing", etc.

POST: I am not my thoughts. Am I also not my mind? (/r/Buddhism/)

If you stop thinking, where is the "mind"? Or do you mean the being-aware that experiences appear within and of? This being-aware is what you are, but it is not a thing or an object. If all thoughts, body sensations, and so on ceased (forms in experience) there would still be this being-aware (Try the little thought experiment in the middle of this post [Outside: The Dreaming Game].)

Remember, there is a difference between how we conceive of things (we think of the "mind" as a container in which thoughts appear) and what our investigation actually shows us (there is no such bounded container, there are just thoughts arising, or not, in open unbounded awareness).

Yes, I do in fact mean the being-aware. Do you think the being-aware is also not "I", or is it "I"?

The "I" that you conceive of must be an idea or an experience within this being-aware, so it cannot be it. Some people call this your "true self" or "larger self" but whatever it is, it inherently has no boundaries and has no structure in and of itself, so it cannot be seen from the outside or described. You can only be it and know you exist. It's only property, this awareness, is being-aware. Any content that appears within it takes the form of patterns and may seem to have other properties. However, when those patterns fade and dissolve, we are once again left with an objectless, non-material material that is just aware.

A1: Your answer is that an experience is happening. there are all these "arisings" within experience and labels get applied. there is no "self". There are only experiences, and the experiences that appear to center around a body you call "self"

Interesting. Can there be non-experiental existence? I suppose so.

Well, there can be the experience of just being without there being any content.

POST: I had an 8-hour panic attack, quit my job and I couldn't be happier. (/r/Buddhism/)

Q1: that agrees with the contemporary Integrated Information Theory of Consciousness
The whatterwut???
Reads Wiki article: [https://en.wikipedia.org/wiki/Integrated_information_theory]
::head asplodes::
Any umm... more accessible explanations of that would be lovely.

Q2: I would love to find a good, accessible explanation of this theory. The stuff I've encountered so far is really dry, but I slug through it because I'd really like to better understand it. I hope as this theory gains traction, we'll start to see good, short YouTube videos on this stuff from, maybe, the PBS Digital Studios (I adore their Crash Course and Space Time channels). The theory, more or less, agrees with the Buddhist notion that consciousness isn't an isolated event. Abhidharma asserts that consciousness always arises with other mental events like seeing, hearing, thinking, et cetera. Consciousness as a seamless experience that flows from one event to another is kind of like a movie which is a bunch of single, still frames, that are shown in rapid succession and so it appears to be a moving picture. Consciousness is the same - it occurs because several things are happening all at the same time and, together, they create an illusory experience of consciousness being a real, unfolding event (if that makes any sense). The IIT says that consciousness arises when information is integrated together in a system. This has a very interesting implication: Namely that if this is what any system does, then consciousness is a function of the universe (not a fluke of biology). This means that even a nebula or star system could have a form of consciousness. Granted, human beings have a very specialized form of consciousness so it's not like you could have a conversation with an exploding star. A feature of consciousness that's important is that it is self-referential. Meaning that consciousness can change itself, by itself. You can think about things that make you happy, and feel happy - without any external thing helping you out. This is important because people can do all kinds of things while not being conscious of it - like sleep driving, sleep eating, et cetera. You can be "aware" or "paying attention" and attending to complex tasks such as these, but you're not conscious of them. In this way, you're acting as an input-output device. Consciousness is something else; it is more than this. There's even a pretty good idea about why and how consciousness happens in our brains. There's a set of cells in our brains which appears to consolidate all of our brain activity - this integration of all the brain's activity creates a generalized experience and this is where the appearance of consciousness arises. Imagine you have a bunch of rides at a circus. Each ride is its own closed system, its own activity and process that operates as it does. If you were to create or provide for a place in the circus where all the rides intersect and integrate a portion of themselves, in that jumble of inter-being, you would have a consciousness arise. This is also important for the future of Artificial Intelligence because it means we can't simulate a brain in a computer and have that brain be conscious. A simulation cannot have consciousness because it's not a complex collection of interacting systems. You would have to physically build an artificial brain that "talks" to itself. ... sorry to blah blah blah at you about this, but it's a really interesting topic and the idea that consciousness is a function of the cosmos is both really, really relieving and also really wonderful. It fills me with awe and appreciation. It also suggests that Buddhist ideas about the formless aggregates may be factually true.

It's an interesting model, but I do think it conflates "consciousness" and "consciousness-of" a little, as do most emergent theories - i.e. it doesn't tackle the hard problem. Although if you begin by asserting that consciousness is the background in which everything else arises, that the property of "awareness" is fundamental, then you can dodge that problem perhaps. Then, having pre-answered "what is information made from?", you're free to progress, whether you prefer panpsychism or a more idealist or non-dual approach.

Q2: I found that to be a potential problem, too ("consciousness" and "consciousness of"). I found it fascinating that this theory does, in a small part, look at this problem. It addresses how attention isn't consciousness ("being conscious of something doesn't equate consciousness), citing how you can perform a task without being conscious of it

(sleep walking) - so merely attending to an activity ("conscious of") isn't something that can qualify as consciousness itself. I think this theory hasn't quite reached the subtlety of Abhidharma which points out that consciousness arises alongside with other senses, but I have confidence that it will. At present, the IIT assumes "consciousness" is an ambient, background experience - the field in which experience takes place. I expect that as this theory gains traction and is looked into more, we'll start to see it come to similar conclusions as what we find in the Abhidharma. Curiously: Physics has undergone a similar shift. For a long time, it was considered to be the case that the universe played out in the field of space-time but, as it turns out, space-time is just another thing that happens in the universe alongside mass and gravity. It's an idea that's gathering attention: spacetime is not real.

I must say I'm not a big fan of IIT overall, because it still persists in a view that the world is a "spatially-extended place unfolding in time", and I don't think that's viable. There's also the inherent problem with describing a world objectively when no such world is ever experienced - "objective reality" remains a conceptual container to which a subset of subjective experience and thinking is attached. This is okay for general model-making, but when you are talking about consciousness, then it stops making sense pretty quickly, because you end up trying to give it spatial and temporal qualities, when it is actually "before" those. But anyway. If you haven't looked into Donald Hoffman's interface theory stuff, you might be interested in that. His TED talk and a couple of others are on youtube, and there's his Conscious Realism paper which is worth a read [<https://sites.socsci.uci.edu/~ddhoff/ConsciousRealism2.pdf>]. On spacetime not being real (to be honest, I don't think any actual physicists, at least the original set who participated in those discussions, thought it was "real" rather than a model, but popular science media tends to flag-wave), you might find these interesting:

- Physics: QBism puts the scientist back into science
- What's bad about this habit (on the reification of abstraction)

It's quite a good time for serious thought in these areas, I reckon.

Q2: Thank you for these links! You've given me a lot to think about, too. I didn't get the impression that IIT holds that view of spacetime, but it's likely that I haven't come across that element yet and, in which case, I would agree with you. Even physics would agree with you, there. I watched a PBS Digital Studios summary of this topic which suggested the only thing we could consider to be real is causality. I'm not sure what to make of that or how it might related to the buddha-dharma (if at all - it doesn't need to, it's just neat when/if it does). You're right about what physicists consider to be "real" ... their use of the word "real" has a very specific meaning which can be compared and contrasted with our colloquial use of the word. Since I seem to have some time on my hands, I can explore those links you provided. Thank you!

It's been a while since I've read about IIT, so perhaps I'm wrong, but I think that was at least the implied position when I was reading Christof Koch's take on it. He used it as the jumping off point to a panpsychism that implied objects as being formed of consciousness, rather than experiences arising in consciousness (which is an important difference). Hmm, so, I'd rather say patterning than causality. I don't think one event can cause another, any more than one thought can cause another. Reusing a metaphor: If there are two folds in a blanket, and I pull on one fold and the other is moved also, did fold-1 cause the movement of fold-2, or is it just part of a larger movement or landscape?

You make a very good point: the specific use that science makes of colloquial terms can be a real problem. The prime example being people interpreting "laws" as meaning "rules which govern the universe" rather than "inferred regularities used as generalised descriptions". Anyway, hope you find the links thought-provoking!

POST: Why I am fascinated by the Mandela Effect. (/r/MandelaEffect/)

Q1: The way I see it... as long as you know the truth in your heart... who cares what some simpletons with their "bad memory" nonsense think. I agree it's upsetting at times but then again the average IQ is 100, you gotta take that into consideration as chances are you're arguing with average, or even worse, a dimwit. Tomorrow a fire breathing dragon could appear flying across the sky and there will still be some people that say it's swamp gas. There are some people, that are completely close/narrow minded. It's better to avoid and not argue with them. They are willing to lie to themselves to ease their mind, I'm not of that persona. Also my memory is good too, not as good as your memory though. I was an honors student as well. It seems my childhood memories when my brain was most impressionable are the strongest. Like for example I can tell you the make, model, and color of my grade school teacher's car. The most telling thing IMO is that for the most part, the memories match up across the board. If it was just a bunch of random people with random non-linking memories then I can see the skeps dismissing it as "memory confabulation." But when you have people's memories/experiences across the globe linked, then it points to something much more grand. But fear is the strongest of emotions, and I've found skeps tend to let fear overrule logic and yet claim to be "scientific" while doing it. It also appears they are the loudest too, as is usually the case with ignorance. For example, the "mandela effect" wikipedia redirects to "memory confabulation."
The funniest thing is. That they claim to be scientific, yet science proposes that many worlds/timelines do infact exist. So it it really outside the realm of possibilities that there is interaction as scientists are now proposing? The skeps can't explain quantum entanglement let alone any of this. So in typical fashion they deflect and disinform like usual. I believe in our lifetime the truth will come out, hopefully.

Some thoughts -

A note on the Wikipedia entry

The Mandela Effect entry on Wikipedia wasn't always a redirect, although it was never particularly well researched - see the archived page. As I recall, there was a bit of a tussle in the edits trying to get that page deleted. No conspiracy there, but I do think it indicates a larger problem when it comes to the presentation of controversial topics. See the deletion page - here. User oneforfortytwo seems to have been the prime mover, on grounds that it didn't meet the "notability" guidelines ("seeing as the only time it got any exposure was eight years later in a debate about the title of a children's book series") and that there is no scientific evidence (for what, exactly, I'm not sure). Which conflates the experience, the cultural phenomenon, and its interpretation, perhaps. Regardless of what one thinks of the Mandela Effect, I'd still say it's concerning when Wiki articles are redirected like this, since it is literally saying that "Mandela Effect" is a synonym for "Confabulation", when regardless of one's position on how exactly the Mandela Effect works, it is not. At a minimum, there is a cultural and historical context to it, without which the topic is not being properly presented. Now, it is not being presented at all.

More generally

If one has the opportunity, it can be tempting to edit history so that only the version you "know" is right is available, so that "the vulnerable aren't misled", so that people aren't "corrupted" by "woo" - and to see this as a noble project to be entered into with fellow champions for good. (See presentation: Guerrilla Skepticism on Wikipedia, for example.) However, what can tend to happen is that one swiftly moves from correcting the narrative for accuracy, to editing out the description of other narratives, then even the fact that other people hold contrary narratives and that alternative viewpoints exist at all. Finally, even references to the existence of certain experiences are removed since they don't fit into the favoured and obviously correct description, or are dismissed in hand-waving fashion without saying how exactly the preferred view accounts for them. This is why this subreddit separates out the experience from the explanation. This allows us to declare the following things as facts, without aligning with any particular conclusion or worldview:

- The fact that people report a certain type of experience.
- The fact that people have offered numerous different explanations for those experiences. (And that there are historical narratives attached to each of those.)
- The fact that there is a historical context for "the Mandela Effect" as a cultural phenomenon.

When the optimisation of any information resources shifts from improving clarity and accuracy and into the realm of "controlling the narrative" - of enforcing not just a uniform worldview, but the possibility of even entertaining another worldview by omitting the existence of these types of facts - we should all feel uncomfortable, regardless of our individual views.

Related

Perhaps worth a read is this well-written review of Paul Feyerabend's Farewell to Reason, which discusses the relationship between science and society, and in particular the idea of a single dominant worldview. Sample quote:

"The assumption that there exist universally valid and binding standards of knowledge and action is a special case of a belief whose influence extends far beyond the domain of intellectual debate. This belief... may be formulated by saying that there exists a right way of living and that the world must be made to accept it."
-- Paul Feyerabend, Farewell to Reason

...

Q2: In therapy I learned that somebody dismissing your memories can be a way to manipulate, even abuse you. I found that part fascinating.

Gaslighting! From the link:

[QUOTE]

Gaslighting

Gaslighting or gas-lighting is a form of mental abuse in which information is twisted or spun, selectively omitted to favor the abuser, or false information is presented with the intent of making victims doubt their own memory, perception, and sanity. Instances may range simply from the denial by an abuser that previous abusive incidents ever occurred, up to the staging of bizarre events by the abuser with the intention of disorienting the victim. The term owes its origin to the play Gas Light and its film adaptations, after which it was coined popularly. The term has been used in clinical and research literature.

[END OF QUOTE]

Quite disturbing.

POST: [Theory] Operation Berenstain (/r/MandelaEffect/)

Q1: The whole point of a "true ME" is that there is no "residue", everything changed. What is commonly called "residue" is called that to escape the fact that it's evidence of something not being a Mandela Effect.

From the sidebar:

Note - Given nature of the effect, 'evidence' inevitably takes the form of shared personal memories; physical evidence of the previously remembered state is unavailable. If such evidence is discovered, that's proof of an alternative explanation.

Q1: I sort of disagree with the way that's worded. If no residue ever existed, then we could have likely written this off as a result of confirmation bias awhile ago because people would trust that they were just having false memories instead of real memories that changed. I just feel like that is a double standard of skeptics. People refuse to believe that a change occurred in the first place, then when a piece of residue surfaces showing that it more than likely did, that's proof that it did change, but it's explainable. The problem I have with that is that I would say it's pretty much 50/50 with the percentage of residue that makes the ME 100% rationally explainable for me.

The wording tries to not be too specific, because it's trying to avoid saying that, for example, instances of a misspelling count as "physical evidence". It's more about, say, it being discovered that there were in fact multiple editions of the film 1408 with different endings, so remembering one and then seeing another isn't a Mandela Effect, things like that. On residues, though: If a change occurs, though, why would there be a "residue"? What is the mechanism for that? If a world fact has shifted, then the entire pattern of the world would shift in accordance with that, surely?

For example, all instances of "Berenstein" would shift to "Berenstain" - all experiences of the-fact-of-that-name would now be "Berenstain". This doesn't mean that instances of misspellings can't exist, of course, just as there would if there had been no shift - the content of the "fact of a misspelling" would just be different (a misspelling would now be "Berenstein" not "Berenstain"). I don't see how instances of "the old way" prove anything at all? I don't find this notion of a "residue" very compelling really; it's doesn't add anything to the "fact-shifting" model of the Mandela Effect. It seems like a science fiction narrative added on top, and for no great benefit?

I think to say so for certain would be underestimating the complexity of said quantum forces at play.

I definitely agree that we have to be cautious here, but I'm inclined to suggest that - in the absence of a specific detailed model - we should keep things reasonably simple. Introducing concepts like "residue" presupposes that a certain type of event lies behind it. At this early stage, we should be aiming to uncover assumptions about the nature of our experience, and not unwittingly introduce new ones. Even in your sentence above, the idea that what is responsible for the Mandela Effect is "complex quantum forces" seems to me to be us jumping ahead a bit, maybe using the language of physics a little loosely and (it may turn out) inappropriately. The effect might turn out to be best described at a stage "before" those sorts of descriptions; it might precede the "quantum forces" descriptive framework. But you do imply something that I think is a key consideration: if we're interpreting the Mandela Effect as being a sign of a "shift" of the "world pattern", then on what basis can we elevate one fact compared with another? It becomes effectively meaningless to label one fact as a "residue" simply because it corresponds to our current memory - the whole pattern is "now" rather than in history, and its current state is essentially arbitrary; it could change at any time to a different distribution of facts (potentially).

Q1: OK, "quantum forces" may have been to glitzy of a term, but I was more just referring to your comment about "if it is a shift in world facts" rather than the alternative, being collective false memories or whatever. And yeah, your last paragraph was precisely what I was getting at. Taking that into consideration, I do see the benefits of keeping things "reasonably simple" because of how confusing things can get attempting to interpret what we are experiencing. There does need to be a mathematical approach of sorts in the way we observe and process this information, it's just hard to know if our "math" is right.

So, I think (and this is why the sidebar defines the effect in the way it does) that if we always keep in mind that the primary thing is "the experience of world facts having changed" - where that sentence is intended to make no comment at all on what is "behind" that experience - then we're okay. We can then play with different possible descriptions without ever committing to them as being "what really happens", and therefore we're free to change our ideas and even hold multiple explanations simultaneously without having to decide on one being "the truth". At all times, we remember that explanations are "parallel constructions in thought" rather than "how things actually are". (It could be argued that "how things actually are" is really just "the sensory experience you are having", and that explanations are always just stories, made of different "stuff" - concepts - than experiences are.)

This even means we can use ideas like "quantum forces" if it is useful to do so, because we are being careful not to make the mistake of "reification of abstractions" ["What’s bad about this habit" by N. David Mermin] (that is, confusing our ideas about things with actual external causes of things). I'm personally inclined to go for something one step back from that, though - something based on a structuring of subjective perspectives. But even then I never really need to fully commit to that, to the exclusion of other ideas or otherwise, because of the approach above.

You probably have the most well-rounded perspective on this issue out of anyone here. That link was actually interesting; thanks for that.

Yes, it's a nice snappy little article. If you like that, you might also find George Ellis's Nature piece on the scientific method, as regards string theory and multiverses, interesting. Although not explicitly stated, it's part of that same line of thought.

POST: [Theory] What if time travel, ISN'T what we think it is? What if it's just shifting through universes? (/r/MandelaEffect/)

The Infinite Grid of All Possible Moments.

Q1: Yes! I call them "decision points", but "possible moments" works too :) And in my visualization, certain points are fixed, like a hub. Singularity decision points, you could say, that connect across all possible timelines. I believe it's easier to change position under the influence of a singularity decision point, but with enough whatever works this it could be possible at any divergence.

Ah, but we're maybe differing here. The "possible moments" are more like 3D-sensory-immersive "frames" of experience. Each moment is as good as another, and is in no particular order. Although in a way that means that every moment is a "decision point", like walking across a big chess board and you are stood on one square, choosing the next square. The secret sauce? That although we assume we step from square to square, we are in fact teleporting - and all squares are possible from every other square, not just the adjacent ones. Of course, how exactly this is done - and how this relates to the concepts of timelines and hubs - is up for debate!

Q1: I do think we're still getting at the same end along different routes. What I would call a decision point is not so much an A leads to B leads to C with splits leading off of each one. They are instances of opportunity, like playing some sort of cosmic tabletop game (only you experience that game as an immersive "reality"). Some of those instances allow only minor variation and after changing instances you might only notice that "damnation" is spelled differently. In others, you discover that Iceland has relocated. I think these are side effects of shifts, and I think the size of the shift correlates to the size of the change. I think that a large shift to an opposite square rather than an adjacent one is possible, but the whiplash of such a drastic change would have a lower probability of survival.

So, let's agree: that from any this-moment on The Grid, absolutely any next-moment is available in theory. However, practically speaking our trajectory-so-far limits the likely next-moment set. I say that every moment is a moment of infinite opportunity, however the apparent barriers may vary from moment to moment. And I suggest this is because we traverse the grid using associative traversal. Which means, that we traverse the grid according to the next-moments that are conceivable to us. Without getting too out there, if your now-moment was 1970s America, you would be unlikely to have a next-moment with an iMac and a black president. Such a moment would exist, but you would be unable to conceive of such a thing, you would be literally (almost) unable to experience that.

POST: The woman who sued McDonald's after she spilled coffee in her lap used to be regarded as a frivolous lawsuit. But now... (/r/MandelaEffect/)

Concept: A Mandela Effect Scale

Okay, let's maybe see if we can establish a scale that might allow for a more intuitive way of thinking about what different groups are calling 'Mandela Effects'. (Remember that the original website description really does invoke multiple worlds. In contrast, we're not going to define the levels by explanation, only by directness of experience.)

The current definition is:

- "The phenomenon where a group of people discover that a global fact, one they feel they know to be true and have direct supporting memories for, has apparently changed in the world around them."

What I'm trying to come up with is what would constitute the hypothetical 'pure' Mandela Effect from which different variations might be scaled. The 'pure' version would be where you have a direct experience of something which is generally true (e.g. seeing a map of Japan) and then later have another direct experience of the same thing (seeing that same map), only to discover that it is different now (Japan has shifted on the map). And there's no evidence of the previous state. Beyond this, the experiential fact (positions on that map) and the thing the experience is "about" (positions on maps) become more remote. So in our example, the key "fact" that changes here is the content of the particular map itself, not actually the location of Japan. So let's start with that as the primary version and work out from there:

- Level 1: A particular map doesn't now correspond to your memory of that specific map. (All other maps are consistent with this.)
- Level 2: Other maps now don't correspond to your memory of that specific map. (You don't have access to the specific map anymore to check that.)
- Level 3: No specific maps involved but current maps in general now don't correspond to what you think they should show.
- Level 4: What people say about the geographical location of Japan today differs from what you remember them saying in the past.

Only ME1 is "Mandela Gold" and as direct as it gets, ME2 is secondary and contains a direct element, ME3 indirect and is what most posts seem to contain, ME4 is completely detached. Things to do with consensus views and propaganda would be an ME4; your post would be an example of that. The further up the scale we get, towards ME1, the more difficult it becomes to construct a standard explanation other than "memory glitch".

Yes! This is why I posted this. I think it's possible that this very type of thing could be behind some other Mandela Effects as well! But mods like /u/TriumphantGeorge want to suppress that idea and only allow for metaphysical and paranormal beliefs.

It's not about beliefs, surely, it's about the directness of the experience. There's a difference between, say:

- The evolution of the presentation in the media about a situation or event - the facts of the world as mediated. The consensus has moved, but evidence of the old consensus can still be found in historical records.
- The evolution of your direct experience - the facts of the world as encountered. You have an experience is evidence of a fact. Later, things appear to be different, and you cannot find a record of the original evidence, or it has changed.

The evidence is the fact, rather than the content as such.

So if I understand you correctly, in order for it to be considered a Mandela Effect, there must be no evidence of the old consensus, right?

I made no mention of evidence of the consensus. Rather, it's evidence of the experience or encounter that matters. I would say that the "effect" rather the evidential aspect of a Mandela Effect would refer to the direct "personal" encounter rather than the inferences drawn from it. Taking some classic examples:

- You encounter an article in a newspaper. It says a famous person has died. Subsequently, you see them on television. You are amazed: you read about their death. You try previous articles you remember (you feel: know) you read announcing that death. You cannot find any.
- You spent 6 months studying geography with a particular in interest in Japan. Two years later, you are looking at a guidebook; Japan is in a different place to how you remember (you feel: know) it to be. You look at your old maps: they show the same 'new' location. You cannot find a map which corresponds to your memory of where Japan "used to be".

Neither of these cases is about your personal encounter with "the consensus"; they represent a change in the apparent physical fact of the world, en route to an conceptual fact of the world. Certainly there are possible explanations one could come up with, re: memories and exposure, but the experience is direct, rather than of second-hand experiencing of a shift in general opinion. Meanwhile...

As with a "glitch", a "Mandela Effect" is what is left when all other explanations are taken away. In most example this is not possible, right? So what we are left with is open cases, with it being judged on personal judgements of what one considers "plausible". Inherently, if we were to, say, post something for which we already had an explanation - there's not much to unravel or explore. We'd just be holding it up as an example of "hey if I hadn't thought this through, I might have thought this was a world-shift", a way of indirectly suggesting this was the source of other examples, without just directly proposing it. It would be a little disingenuous.

Q1: So what sort of expected responses are permissible? Because when someone says "Guise, srsly! Japan is in a different place!", there's only so much discussion that can happen that doesn't at some point turn into "Memory is notoriously unreliable."
I've had a couple of instances where I thought I'd heard a celebrity had died. One was Don Ho who I swore I'd heard on the news around 1979 or so that he had died, and one was Gene Hackman who I swore I'd heard had died around 2005. Obviously I was mistaken in both instances, but to me that's what the Mandela Effect is: someone was mistaken. There are plenty of reasons someone could claim they believe they weren't mistaken, but as far as I can tell those can all be linked to mental illness, drugs, or Dunning-Kruger. Like, /u/Roril who believes he switched dimensions; okay, fine, he believes that, but at that point what's left to discuss?

Well, any suggestion of an explanation is permissible, right?

You're correct, though: since these are basically experiences that people have that have already happened, in general it's not likely you'll ever get to the bottom of it. To do that, we'd need to have a detailed model that we could then test with a replication of the conditions. I think that expecting to reach a conclusion for every example that everyone accepts is "true", would be a bit of a hopeful thing for us to do. But...

We can present our different ideas, discuss how they would work in that specific case, and others can go with it or not. The discussion is in the detailing, and sometimes a bit of research might actually explain away a particular example convincingly. Apart from that though, it's handwaving. For instance, "memory is notoriously reliable" isn't really an explanation for a particular event, it's just a statement of a broad and non-specific consensus. Concluding yourself to be "mistaken" or not, again it's down to interpretation: things don't match, so I'm concluding my memory went awry. It certainly fits our generally accepted view of the world better than "switching universes", although it's no more provable. That got meandering. So, what I was getting at:

- All we can do is lay out the description we personally prefer, as clearly as possible, and engage in discussion arising from it.
- Others might prod them to explore their coherence, but we cannot establish their truth.
- In the absence of being able to suggest a mechanism which describes how, exactly, something could have happened, most proposals are going to be fuzzy and going one way or the other will be about personal preference.
- In reality, all reports probably remain "open cases". Like the rest of life that happens outside the laboratory, **there are no answers, only choices.**

The problem with the entire effect is that the personal experience is inherently that - personal. We have no way to prove (nor, should I say, disprove) as yet, as an external, ambivalent, neutral observer, the hypothesis that certain people have "shifted" between two discrete and discernible realities.

It's the ultimate subjective topic - and if nothing else, it emphasises to us that all experience is subjective, and the objective frame is just a concept we have to describe the language-shared commonalities. Personally, I think that as soon as we move away from direct experiencing, we are entering the realm of conceptualisation. And that is fine, but it means we need to treat all of our explanations with a little detachment - we literally make them up in our minds, whether that is "timeline jumping" or "false memories". Regardless, there's lots to play with in terms of understanding perception and our world better. For as long as we don't understand what and where memories are, exactly, and we don't have a description for perception is, fully, we're never going to be able to come up with the equivalent of a "theory of gravity" for our ongoing experience (if even we can).

- Example: Darkroom Vision experiences.

One explanation: "hallucination". But how does that work, exactly? Without that, it's just nonscientific handwaving, no better than no explanation at all. I'm inclined to think that better accounts of ME/etc are to be found be deeper investigation into those sorts of perceptual anomalies. However, they are very hard to study because they are not very predictable and controllable.

For the sort of noticeable changes you're seeing, you'd have to go some way into the past to find the moment that switched between one set of circumstances and another,

Why would we have to go into the past for the explanation? If things truly can "shift", then why wouldn't they be free to shift to any new state, including an implied history within that state, so long as the overall structure was self-consistent?

POST: [META] Why do so many scoffers talk about confirmation bias as if it debunks the ME? (/r/MandelaEffect/)

Q1: I'll try my best here. In science one needs to lose all preconceived ideas before interpreting evidence or data. As far as the Mandela Effect, if you already believe what is happening is because of the shifting universes then anytime your presented with new data you interpret it as evidence of the ME rather than the possibility that it could be unrelated. For instance, a person who is mentally sick or simply misremembering, these things happen and are unrelated to the ME but people with confirmation bias interpret as it is related. That doesn't mean that it necessarily "debunks" it but rather keeps the proposed "evidence" as nothing more than assertions. Another problem is that there can be little to no evidence for shifting universes, by the very nature of it...

What you say is true. I think a lot of posts misuse the term re: Mandela Effect though. I think OP was trying to say that if you don't know about ME and one day you suddenly notice that something has changed, later discovering others have noticed the same thing - then it can't be confirmation bias, since you had no theory-of-the-world you were applying when you made the observation. Loosely, I'm thinking...

Confirmation applies to your interpretation of your observations - the analysis of the dataset - not the observations themselves. The same applies to the frequency illusion. The frequency illusion suggests that, given a particular dataset, you will make more observations of a particular type. It doesn't mean that each observation is itself invalid. Neither of them affect the fact that you are observing, case by case, that part of the world does not match your memory of it. It doesn't matter what you call it (confirmation bias) or how often you notice if (frequency illusion). This is what I'd say the Mandela Effect actually is. Everything beyond that is interpretation.

Yes you have it correct. Most people learning of a ME that affects them had no reason to believe in any of the crazy ideas that try to explain it, they aren't being affected by confirmation bias in the least, they just had a weird experience.

I do think one of the problems is that the term "Mandela Effect" on this subreddit has become conflated with a particular interpretation of it. A similar thing happened with "glitches" becoming confused with the idea that we actually live in as simulation. We have to emphasise that the "glitch" itself is the experience of something unusual for which you do not have a ready explanation. The possible explanations you come up with are separate from this. I feel this is a larger problem that has developed generally: that we treat our invented abstractions about the world as being "more real" than our direct experience of it. People are quick to jump straight to "parallel realities are merging" rather than saying "I experienced a tree being in my garden when there wasn't one before" - or whatever.

Yes, that does seem like a pretty big problem. I don't believe in the parallel universes, and collapsing universes, and the scoffers act as if every time someone talks about a ME, that's what they're claiming happened. Sometimes a ME report is just a ME report and not claiming to know why.

I think that's exactly why people scoff. But they scoff so much, that they don't realise that it's not what is being said by most people. It works the other way around too. In the last few days, the sub has tried to reflect that in the sidebar and in the mod posts - defining ME as noticing that a "global fact" that you have "specific personal memories" for now seems to be different - emphasising that there is no particular interpretation inherent in this. A lot of people seem to really want this to be parallel universes; a lot of people really want it to be false memories. Passionately. I don't know whether that's because of this tendency to jump straight to the interpretation, rather than leave things as an "open verdict" and explore its nature more thoroughly before making a decision (if at all). It can not be parallel universes and also not be a psychological artefact. Top rules, I think:

- Just because you read about something in a popular science magazine, doesn't mean it's applicable in this specific context.
- **If you have not tested your theory in the specific context, then it's just a fun idea** - it may not apply.
- **If you cannot test your theory in the specific context, then it is philosophy or metaphysics** - and that's okay.
- **Naming or categorising something isn't the same as understanding and explaining it.**

I'm guilty of using the term "Mandela Effect" to mean "interpretations of ME" and I apologize for that. I thought that we were discussing the interpretations when talking about debunking it. I'm on the same page now.

Well, it's natural really - people first go to Glitch because "reality is a simulation" and they first come here because "universes are colliding", and the sidebar wasn't very clear before. Plus: too many subscribers, not enough moderation.

If we think of it as an investigation into reports of a particular phenomenon, then I think we can't go wrong:

1. Record instances where people report memories $\neq$ world facts.
2. Come up with possible explanations on a case by case basis.

Sometimes there will be an obvious explanation. Sometimes there won't. Standard and esoteric suggestions are fine. Mostly, due to the nature of the phenomenon, we'll have an "open verdict".

*Q2: I think OP was trying to say that if you don't know about ME and one day you suddenly notice that something has changed, later discovering others have noticed the same thing - then it can't be confirmation bias, since you had no theory-of-the-world you were applying when you made the observation.

To use an example, how many people write out the word "dilemma" on a daily basis? To be honest, hardly ever. I never even knew "dilemna" was a common misspelling of it until this subreddit. How many chances do you have to get called on it?

I've seen lots of other misspellings; "definitely" is often misspelled "definately" or "defiantly". I have to spell my last name all the time on the phone or in person, as people evidently mishear it as "Goodman". It doesn't matter what the fact is; the spelling of a word, the date of someone's death, the location of a place. If you think it changed? For whatever reason, you were wrong before. If, when shown evidence of the correct fact, you double down on being wrong and claim you're right and all the evidence in the world is wrong, I'm sorry, but I don't know what to tell you. You were wrong about Berenstain. You were wrong about dilemma. You were wrong about the date Nelson Mandela died, about the location of New Zealand or Japan. And -- so what? I don't really care, except that people here keep talking about it. Me, when I find something that I've been wrong about -- and I have! -- I shrug my shoulders, go "Oh, I was wrong about that, sorry!", mentally file away the correct version, and go on with my life. I don't get why other people can't do that.*

And that is why the sidebar now emphasises:

"The phenomenon where a group of people discover that a global fact - one they feel they know to be true and have specific personal memories for - has apparently changed in the world around them."

The point being, there are some posts here which are of the form "I always kinda thought this, but I see it's that". There is no specific memory attached to it. Others, though - the people who are persistent on this topic - are reporting a different sort of experience. The actually remember the direct experience which led them to think one way, and so were later shocked to discover it was another way. They have a specific memory rather than just a vague notion. Otherwise, yeah, you're right: they'd just go "ha, silly me, I was wrong about that". I mean: people have better things to do. The reason that they are so focused on it - behaving so weirdly about what looks to be a mistake - is because they aren't in the situation you're assuming they are in (from their perspective). The problem is that two things are getting muddled up, and the posts on this subreddit obviously reflect that. For example, let's take two versions of one thing (exaggerating for effect):

1. A person one day reads an article about "dilemma" and goes, hey, crazy, I always thought it was spelled it "dilemna", that's mental!
2. A person who used to write spellchecker software for IBM, then gave up computing to teach English, before doing a psychology dissertation specifically on "situations in which a difficult choice has to be made between two or more alternatives", suddenly notices one while typing an email on day that, rather unusually, one of the words is underlined red: "dilemna". He pauses. He clicks "OK" to correct spelling. It changes to "dilemma". The spelling he has been using for that last 20 years never works again.

You get the idea.

Q2: *Others, though - the people who are persistent on this topic - are reporting a different sort of experience. The actually remember the direct experience which led them to think one way, and so were later shocked to discover it was another way. They have a specific memory rather than just a vague notion. I absolutely doubt their claims to direct experience. I doubt their claims to whatever expert knowledge they claim. They got it wrong. I've been in enough discussions with those people over the years, and gone to the sources and seen that they were wrong. They won't look in the sources again. They're like Roddy Piper's friend in They Live; they're so sure they're right they'd rather spend fifteen minutes in a fistfight with their friend than just put on the damn glasses. If they can show whatever source they went to, and it's wrong, then yeah, I'll put on the damn glasses. If they're sure that whatever source they looked in has changed... Occam's Razor. They were wrong before. I'm sorry, no matter how sure you were, you got it wrong.*

I think you're conflating two groups of people here. (Note that I'm not advocating any specific explanation for any of this. I'm just emphasising what it is that needs explained, vs what does not.)

There is a difference between:

1. People who are going looking for esoteric aspects to experience, for whatever reason, and
2. Those who have had an experience they can't explain, and then go looking for an explanation.

For the first set, those who go looking, then all the usual things potentially apply: confirmation bias, frequency illusion, whatever (although not necessarily). But that's all on the interpretation side. It's silly to argue with someone on the basis of an adopted worldview. The second set are the interesting ones. Sure you can say "they're wrong", but that's not saying anything new: they are obviously wrong now - what they thought they knew now doesn't match how the world is! What's interesting is how (from their perspective) they one day changed from "being right". In that case you are seeking to explain an experience, an event. The problem is: there are no sources you can go to. The whole point is that they can find no evidence of "how things were before". That's why they find it so disturbing and can't let it go! Repeatedly telling them "you are wrong, look: here's a dictionary and it says 'dilemma' is meaningless. If someone has had an specific and unusual experience, denying the experience doesn't accomplish anything. They obviously did have an experience (of some sort). Now, you can just not know what the nature of that experience was - and that's fine. But if you do offer an explanation at all, you have to be able to say how exactly it explains it. (This is where "psychology study buzzword bingo" falls down - just as badly as "quantum multi-worlds".)

Q2: *The second set are the interesting ones. Sure you can say "they're wrong", but that's not saying anything new: they are obviously wrong now - what they thought they knew now doesn't match how the world is! What's interesting is how (from their perspective) they one day changed from "being right". In that case you are seeking to explain an experience, an event. True enough. I'm reminded of, over on Glitch, a few months back when a guy posted about his grandmother moving in with his family, them installing a wheelchair ramp for her, and then moving her into hospice care a short time later and removing the wheelchair ramp, only to discover later that the grandmother never lived with them nor was a wheelchair ramp ever installed -- and there was no physical evidence that one was. Or the woman a year or two ago who had bought a car, driven it around for at least a year, then suddenly it disappeared -- but her family didn't remember it and there was no evidence that she ever owned the car. In that context, I can see how someone wouldn't be "just wrong". There are some possible explanations for those kinds of things, though they do tend to be psychiatric in nature. On the "just wrong" side, I can't tell you how many times I've looked in the dictionary to figure out if a word is spelled xy or yx, then forgotten which it was between the dictionary and the paper. Or checked to make sure I locked the door on my way out, or checked my zipper before leaving the restroom, and immediately after forgetting the result and having to check again. So I can easily see wondering, is it "vacuum" or "vaccuum" (sorry!), checking the dictionary, coming away with the wrong spelling, and filing it mentally as the right one. (And while I did win spelling contests as a kid -- citywide, with prizes and trophies and everything -- there has been a word or two that I've done that with.)*

Right, this is exactly the distinction I'm seeking to make. Without that distinction, we are muddling up (for instance) someone for whom the spelling of a word just stopped working as they were typing it, versus someone who just kinda always thought it was spelled that way. Obviously, that might mean spellings of words aren't the best example to investigating this, exactly due to that categorisation confusion. The definition in the sidebar (>>>) now focuses on the experience rather than the interpretation, and the submission guidelines encourage posters to be more detailed in terms of the actual personal context associated with their story. In effect, it seeks to take a more "glitch-like" approach to the subject (which I hope will mean discussion can be based on curiosity about a phenomenon, rather than fighting to defend worldviews). I'd say there's certainly something going on, and that "changes do happen". Science and psychiatry are "too late" in terms of being useful for the study of it, because this affects the actual tool one uses to perform those sorts of projects (it's already happened and there's no trace other than in the memory). I suspect it's related to some assumptions we make about our ongoing sensory experience being of the same "format" as the world beyond it. Regardless, collecting more detailed anecdotal reports might suggest common threads, and new directions. The ultimate aim being, I suppose: deliberate creation of an ME and thereby proving its nature.

Q3: *Except, I would say most people who learn about a ME have no interest in parallel universes, usually to the lay-person they would think of time travel first, or just get really confused and ignore it, or play it off as faulty memory which most people do. I would say many people who believe in the ME do not believe in multiple universes, and although there are a couple people here who do, most of the time when I see it mentioned, it's mentioned by people who don't believe in the MEs.*

Can we summarise this as:

- ME = the fact of the observation = noticing that your memory and the world are now different.

This cannot be debunked by saying:

- You are interpreting them a certain way (confirmation bias), or:
- You are just noticing them more (frequency illusion).

Because:

- The interpretation of the observations and the number of observations does not affect the fact that you are observing the disparity.

Everything beyond this is theorising.

Q4: Skeptics Guidebook; Page 2; Section 1; Paragraph 1-A: On dealing with the utterly preposterous concept of the Mandela Effect/Reality Glitches: If proclaiming "confirmation bias" doesn't work then emergency parameters dictate to fall back on "What a terrible memory you've got!" Works like a charm.

[COMMENT]

Q2: What's more likely, that someone has been spelling the word "dilemma" wrong all their life, or that any of the following is correct:

- They were taught the wrong spelling
- The spelling changed and somehow everyone "got the memo" except them, and oh by the way there's no evidence of the previous spelling
- They've somehow moved from a universe where it's spelled differently to this one

It's possible but unlikely that someone was taught the wrong spelling in fourth grade or whenever, and that it was never caught by any subsequent teacher.

It's impossible that the spelling changed and all evidence of the previous spelling was hidden. I'm going to call the universe-moving thing impossible, but if someone believes that, I've got no more way to disprove it than they have to prove it. Of these explanations, the most likely one is that the person was wrong about the spelling. Someone who insists that they were right and that one of the other options has to be correct... I feel sad for them that they can't accept that they might be wrong, and at some point their continued insistence that they're not becomes ridiculous. It may not be nice to ridicule them, and ridiculing them might even get someone banned from the subreddit, but at some point it's just not possible to take them seriously any longer.

For reference: [https://en.wikipedia.org/wiki/Dunning%E2%80%93Kruger_effect]

[END OF COMMENT]

[QUOTE]

Dunning-Kruger effect

The Dunning-Kruger effect is a cognitive bias that describes the systematic tendency of people with low ability in a specific area to give overly positive assessments of this ability. The term may also describe the tendency of high performers to underestimate their skills. It was first described by the psychologists David Dunning and Justin Kruger in 1999. In popular culture, the Dunning-Kruger effect is sometimes misunderstood as claiming that people with low intelligence are generally overconfident, instead of describing the specific overconfidence of people unskilled at particular areas.

[END OF QUOTE]

Or, I suppose: **none of the above options.** Dunning-Kruger is fun and all but it's a fancy way of trying to attach authority to the unproven assertion "this person is ignorant and doesn't know it", and then seeking to explain things away based on that assertion. Which is amusing in its own way, because it was basically a joke study that got momentum. It's not bad as a rhetorical sleight-of-hand, though, and it did win the Ig Nobel Prize. Personally, I've never experienced any spelling or geographically-related changes vs my memory - but a lot of people do seem to report them, and some of those people seem to be from backgrounds where it seems "likely" that they would have had the relevant knowledge. Which is why it's interesting. Something I do wonder:

As soon as spell checkers came commonplace (in the 1990s?) everyone should have been alerted to their errors - if they were making them, as they were making them. That's now 20 years of standardised, automatic dictionary checking, and for half of that it wasn't usually autocorrecting, it underlined and you confirmed the change. Which makes me think: how, exactly, does that happen?

It could work either way: it might actually create the problem. But the explanation has to be specific rather than just "people didn't pay attention anymore". (Some people have reported that "one day it changed" and suddenly they are getting spellcheck errors. Those things need explained also.)

The sub is making a centralized post for "spelling vs spelling" soon. It'd be interesting if we could think up a way to use the power of the subreddit (ahem) to do something beyond just swapping "science-y ideas I read once" vs "psychology-ish ideas I read once". The spelling thing seems one of the easiest to do that for.

Q3: I just want to point out, I've never had a word auto correct on me except my old phone, which I turned off because it was never right. Though there may be children out there who are now lazy spellers (and didn't learn how to spell by looking at letters but instead learned by looking at words), and there may be children out there who don't care about the spelling (because teachers don't check for it as much anymore), and there may be children out there who have their words auto-corrected (because all these do is text or use tablets), that is not the normal group of people we have writing about MEs. The most people who experience MEs are in their 20s or older, people who actually grew up taking care to spell by letter, and had to be right because there was no spell-checkers, and when there were, they got annoyed at seeing those red-lines so they would learn how to spell it correctly so it wouldn't happen next time. This is another one of those things people like to blame to act as if ME misspellings don't happen, but when you look at the generations of people who are having these issues, this isn't much of an argument against MEs.

Right, so that's why things need to be more detailed than "Hey, I thought it was spelled that way too!" and other one-liner posts. See, the discussions here rarely go properly in depth and explore these aspects, I'd say - or at least no momentum gets built and no knowledge accumulates. They don't get beyond "you're mistaken" and "no, it changed". It rarely moves away from groups wanting to be right or other to be wrong. But where it gets interesting is when we try and pin down exactly what people are saying they experienced: actual moments. With the spelling ones, we're at a nice time to investigate: we probably have a range of people with different backgrounds (pre-common computing, during the change, and now with them everywhere, all with different spelling-related tech and teaching approaches throughout), and perhaps different people reporting the same ME despite that. Or not. That's where it gets interesting. I don't think there's much point in arguing against MEs as such, since that's:

- "My memory of how things were now does not match the facts of the world."

If you have that experience, you have that experience, no matter what its explanation. You can't argue against the observation; you can only get into it in a more detailed way, and remain agnostic about explanations until you've got all the elements in place. So what you can discuss is what underlies that. But if we don't actually investigate, then (as I said earlier), all that's happening is people are swapping their levels of ignorance via rhetorical techniques in an attempt to win.

Q1: I think the issue here is that you're assuming everybody here falls on the "idiot" end of the spectrum, when in reality there are plenty of average people and likely a few geniuses floating around as well. The thing about the Dunning-Kruger effect is that those geniuses can accurately assess their abilities, they simply assume their abilities are nothing special. When a genius believes strongly that they're remembering something correctly, unlike the idiot they're likely to be correct. So what would you say about the intelligent people with good memory who share the same false memories? Would you move the goalposts and chalk it up to human nature, or would you concede that deeper investigation is warranted?

I must admit, that if the DK effect applies, it often seems to be those (on either side of the debate) who place undue confidence in their limited knowledge of science and psychology or of philosophy and metaphysics. An explanation that "feels right" due to familiarity or simply being self-consistent, is often logically flawed when you actually explore it in detail in the context of what you're applying it to. It often amounts to applying a sort of buzzword-based common sense. So many cases arise of people saying: "hey, maps have different projections you know", "it was always like this, you just remembered wrong", but these amount to a misunderstanding of what people are trying to say. Although if you've not had the experience, it's dismissiveness might be the default. But then, why get involved?

Q1: My guess is they feel compelled to get involved in order to protect their world view. Personally when the dam broke and I realized all these things I remembered incorrectly, I actually remembered noticing it in the past more than once and dismissing it each time because it was too weird/uncomfortable. I just subconsciously avoided anything to do with it, and it took being forced to face it for my mind to even allow the possibility.

Subconscious avoidance of things which "don't fit" is definitely a thing. I think that intuitively, people recognise that pursuing these thoughts leads somewhere uncomfortable. We are forced to realise that we typically assume a directness of experience that is not necessarily there. For starters, it underlines that basic things such as 3D-space and the passage of time are part of experiences, they are part of your senses. The world beyond, such as it is, is not necessarily in the same "format" as the room you are seeing now. The room next door is not actually "over there". And once you get familiar with that, you realise that you have to completely reassess what you thought "you" were. Which turns out to be something more like an "open perceptual space" (your mind!) in which experiences appear. That stuff isn't even esoteric. It follows directly from even the standard sensory model of "world > body > brain > experiences". It's just that people never really think about the implications very deeply. Now, we might retort "brain in a vat, that's unfalsifiable!" but it misses the point. Our experiences are always unfalsifiable; they just are. But we can notice what we cannot claim - and that tends to open out what we can entertain. **The "world as it really is" is inaccessible**, and both our experiences (sensory images), and our experiences of thinking about experiences (shadow-sensory imagination), **are all internal** - and there is no certainty beyond this. That can be quite a disconcerting thought. Obviously, this is philosophy rather than science, since you cannot 'objectively' test the underlying of your own experience; but you can certainly explore its properties directly. (And none of this is new: George Berkeley, Immanuel Kant, Zen Buddhism, have all adopted similar views.)

POST: Quantum mechanics for the other parts of you and the rest of the universe (/r/MandelaEffect/)

[POST]

So quantum mechanics basically says that everything atom A does atom B will have an equal and opposite reaction. So everything in the(know) universe has these atoms. These atoms are randomly spaced through out space and time. If we can find two atoms that have that strange attraction state, we can essentially create a third state. A state between off and on. They are constantly running and processing all kinds of information butt is not in either an on or off state. Now when atoms are smashed in the collider, the are very random and sporadic. It's common knowledge that these atoms are very unstable, seems reasonable that when they are smashed, that the ballistics would be very random and uneven. Yes well that is true, but the strange thing is that all the time atoms disappear and re-appear. We have no clue where they go or how long they will actually be gone. Maybe it's because that there is such a violent reaction the atoms will call to each and they combine to becomes atoms of that third state. When they inevitably fall apart the atoms will separate. Sometimes the event is the smallest margins of time or maybe there are some that take a million, dare I say a billion years to happen. But anyways when they are in the calling process they cross multiple time lines and pick up and transfer tons of information along the way. These time lines are infinite, so maybe through the first 500,000,000 million the changes are insignificant. Your shirt was a different color or a plant had 7 leaves instead of six. When the atom is returning, two things can happen, 1. The atom goes back to its original timeline and no change happens. 2. As I stated earlier atoms act randomly, instead of the original atom returning to its own timeline, one of the infinite copies is instead placed there, creating a different sequence of events. This would explain why we notice small changes in something that we think wasn't there before. We essentially have a particle from an alternate timeline. If we can figure out how atom A is connected to atom B, find both of the atoms. The possibilities are endless, we will be able to do anything. Time travel being the big one. This theory might also explain why we have a spiritual connection to the universe. We are experiencing the infinite copies of ourselves. All of the copies reacting with each other. People have believed in a god since the beginning of time, feeling a connection to something they can't explain(God), but it is the atoms constantly changing and updating information with the infinite copies. Deja-vu a pretty common phenomenon, can be explained by atoms of an alternate time line experiencing an event that already happened in the alternate atoms timeline, before it skewed from its original. So next time you experience a change in something you don't find correct, it just might be a quantum event changing the timeline for whatever reason.

[END OF POST]

- *Q1: As a particle physics major, this has nothing to do with QM. Sorry, you need to study the subject a bit before launching into random conjectures based on incorrect axioms.
- 1)Classical physics is where you find equal and opposite reactions, not QM.
2. I have no idea what you're talking about with a strange attraction state, not off or on; perhaps you're talking about superstate? Quantum computers use such information but I suspect that's not what you mean since it doesn't have anything to do with the way they interface with reality, like you mention.
3. I have no idea what you're talking about with violent reactions forcing atoms into third states. This seems random and has nothing to do with reality, since smashing atoms has nothing to do with them being in any kind of "on" or "off" state.
4. Atoms traveling through some alternate dimension (as you suggest) isn't rooted in science, extraspatial dimensions (so far as string theory predicts) are much smaller than atoms. Even if it were possible to trave through and back to our open spacial dimensions, they wouldn't "contain" the information of alternate universes where your shirts are a different color, like suggested. Ludicrous and bizarre imo
- The Mandela Effect is possible because you have an imperfect brain that through cognitive association and an imperfect hippocampus can create false memories that you are just "so sure" about. C'mon man.*

While I agree that OP's description, while a fun read, has pretty much nothing to do with physics, I'm not sure your "cognitive association' and "imperfect hippocampus" are much better. "Scienciness" rather than science, surely? ;-)

Just look up implanted memories

I have (really, I've been through all of this stuff). When you get into the specifics of cases, rather than the general notion that exposure to imagery while referencing a context can associatively integrate that imagery into the context, and that this may be an approach to exploring some "me too!" people (although I don't see how), it doesn't really explain the actual experience as described, nor its broad coverage. Although there's some churn here ("what about this?" and "me too!"), the actual Mandela Effect is the unprompted recognition of a discontinuity, where there are specific personal memories (rather than abstract facts) and a specific moment of recognition of the change. It doesn't correspond to well to fear-response experiments (which is not really "memory" in the sense we are talking here, although the authors of those studies do tend to make grand claims for the future, but we've been doing that about memory for many decades, and we still don't know where or what they are) or false memory creation as depicted in psychological studies. Any decent explanation of the Mandela Effect, if it wants to be scientific, is going to have to say how exactly it applies in specific cases, then imply a particular model that can be tested. Even the first part would be a great step, but it's been lacking. (An additional problem is that ME is probably not one "effect"; which is why the sidebar now tries to narrow it down to specifics for better reporting.)

Otherwise, we can end up with the pseudo-neurosciencist equivalent of the pseudo-quantum physicist.

POST: (Meta) Concern (/r/MandelaEffect/)

I am concerned that these phenomena are leading [people] to conclude [that others] are less real.

I don't think any of the commonly given interpretations should lead that way. If it's interpreted as a psychological thing of some sort, then it certainly doesn't. But - even if someone likes the "many-worlds" type view (you are "switching realities") then you don't get to be more important than anyone else, more "real"; you are simply appearing in differently-configured worlds, with other people as real as you. In fact, someone who has shifted more, unintentionally, would probably be at a disadvantage. Meanwhile, if you took the "dissolved state" view that everything occurs within your consciousness, and the changes amounted to your own copy of the world transforming, then "you-as-person" is no more or less real than any other "person" - you are all aspects of a larger whole. (In fact this would mean everyone is a part of you, and you would be treating everyone with greater respect.)

So I think everything's fine. People can continue to be as arrogant or as insecure as they always were anyway. ;-)

Note: We should distinguish between the Mandela Effect experience ("my memories now don't match the world") versus any particular theory about its nature.

Simulation Theory easily encompasses all observed phenomenon in the Mandela Effect experience.

That's because it's a theory with no parameters, within which you can incorporate pretty much any conclusion; it's the equivalent of saying "it's all a dream". It's really a narrative rather than an explanation. Which is fine of course, it just means that it's not a predictive model and it can't be falsified. If the world is a "dream/simulation", then any old story will do, because the world can behave "as if" anything is true. There is no fundamental structure; all interpretations are arbitrary patterns.

There is a difference between being able to incorporate things into the narrative, and explaining them. The key to this is the separation between observations and models. The rules are (being very broad for the moment):

- Observations dictate the permitted models.
- Models do not dictate the permitted observations.
- Models are "connective fictions" which we use to link together our observations.
- Aspects of a model which cannot be observed exist only as conceptual abstractions in thought.

So, I would suggest that your ideas of "CPU time" and "Brain-Control Interface command syntax" are conceptual abstractions which you never observe. You are arbitrarily stopping at that level and declaring those abstractions to be "real", whereas you view the ones built upon it as being "simulated'. In fact, if you follow through properly, "CPU" and "BCI" will also be considered as empty. Don't you agree?

In my view, you are making the mistake of assuming there needs to be some sort of solid foundation which maintains or operates structures and processes, and that such things also "happen" or need to be "done" in some sense. What you need to do next is incorporate the idea that:

- "There is no substrate."

[Well, these are interesting topics, and discussions should be an exploration of ideas, not a defence of identity. Even when there's disagreement, it's enjoyable to encounter people who have spent some time thinking about something.]

...

Would an NPC even be able to respond? How would an NPC be able to perform the inner contemplation necessary to come to its conclusions? (Surely an NPC has no inner life - it is a "philosophical zombie".)

Q2: Philosophical zombies have internal thoughts, too, you know. It's just their's is a carefully constrained path, based LARGELY upon our interactions with them. More involved AIs have more CPU and RAM dedicated to them, and also seemingly get software updates allowing more creativity and self-expression, to the poin tthat if we really get in their lives, they can and do fool us. Example: Compare a wild dog to a domesticated one that is loved and given lots of attention. The loved dog will have software much more similar to humans than wild dogs. Same with loved apes who learn sign language. You release them out into the wild and what happens? Same thing that happened to guys like me in the 1500s: Unable to communicate with their unevolved kin and frequently killed by the mob. I motion that because of their continued interaction with humans, the animals received firmware upgrades that allow them to do this. AND I motion the same basic process happens when an Avatar interacts with NPCs. There could be NPCs far far away from the observation of Avatars that are mere probabilities in a deep cache, what Quantum Physics refers to as "the uncollapsed wave state".

I guess what I'm saying is: the distinction you are making is effectively meaningless, in practical terms. Taking just one element: how can you tell whether you are on a constrained path or not? (Also, I wouldn't get too fanciful on the quantum physics angle; it really doesn't have anything to say about this stuff, not scientifically speaking anyway. You can use the concept of "states" in your philosophy but, like the computer software metaphor, I'd be wary of taking these things literally.)

I'm affecting thousands of people on the way to...

In what sense? And how are you judging whether or not you are simply patterning your own experience with a structured but arbitrary narrative?

I launched a billion dollar idea last week in a developing country that's going to sweep an entire continent, two or three in the next 5 years. Something for the Middle 20-50% of humanity. Since when have you heard of a startup doing something like that?

Sounds like programmed behaviour to me, part of an extended pre-structured narrative. How can you distinguish between doing these things and merely experiencing the situations arising? In other words, that your "affecting thousands" is not simply a grandiose story being played to you.

Q2: WELL, I admit. It is an assumption that great people like George Washington and Thomas Paine, and Hitler, etc. aren't NPCs. I'm assuming that NPCs have different qualia than legit humans, and one of the observabe / testable phenomenon is that Avatars can, and have, changed the world, even massively, while no NPC has, at least on purpose. Because I don't think they have life purposes except to make the simulation more realistic, which means "more of the same", more or less.

Okay, what I think we need to do right now, to progress, is to:

- Define precisely what the difference between a "legit human" and an "NPC" is, and:
- Lay out precisely what observations lead you to conclude there are such things.

Note: You cannot beg the question when you answer this - i.e. you cannot use the conclusion as the foundation of your answer.

POST: Does anyone else remember the users on this subreddit NOT being such negative nancy pricks? (/r/MandelaEffect/)

Q1: I think some of you guys have this thing twisted. Let me use a computer analogy here. You have ROM and you have RAM. RAM is something that might get corrupted, you might forget to brush your teeth, etc. But ROM is the stuff that is permanently burned into our being. I KNOW that my ROM does not reflect the current reality. And personally if you want to choose ignorance, I'm perfectly fine with it. For my heart knows the truth and the truth reigns supreme.

Just to get clear: in that analogy, what is the ROM and what is the RAM? And then, what is "the world"?

Q1: sorry for the late response. ROM = long term permanent memory. RAM = short term memory meant to be accessed and written over repeatedly. the "world" is the physical plane, much like our flesh and matter. our consciousness is the logical plane... they are inter-related in my opinion. without the logical plane the physical plane does not exist.

I know what ROM/RAM are, it was more which was what in your metaphor! So I guess it was ROM=world/physical RAM=consciousness/logical. I think they differ only in their depth of habituation; they are not different in type. In other words, it's like a landscape which consists only of its contours - no substrate - and world vs logical is a matter of pattern amplitude.

Q1: both ROM and RAM are mainly functions of the logical plane and I agree they are similar. the physical plane (matter) can be thought of as the hardware. the metaphor is obviously not perfect as ROM and RAM are hardware as well and like I said there is inter-relation and they are both simply platforms of expression if you will for the logical plane, a temporary platform and the physical plane is an extension of the logical plane. It's just incredibly hard to grasp but I feel like I have some of it down at the very least. again this is my personal interpretation.

I say: there is no hardware. We never experience hardware, we only encounter experiential patterns arising in perception, so why not jettison it completely from our metaphor? It doesn't add anything; all the information we need to account for is in the ROM/RAM patterning, with their varying degrees of persistence or inertia.

Q1: I like that and I like how you think. Really I only used the hardware analogy as an explanation.

Fair enough, it was a good starting point, but then we whittle it down!

So the next step is you blend ROM/RAM together and just say: there are patterns, those patterns are of different relative intensities (or depths or levels), and the relative intensity distribution of patterns is what dictates your ongoing experience. To make this more intuitive, we might consider these patterns to be the current "facts" of our world, although some of those "facts" would be quite abstract, and more like "formatting" - e.g. "sensory experience is formatted as 3D-space"

Q1: when I set out with trying to explain what I was thinking about this it was more an idea to keep everything as simple as possible so it could be readily interpreted, hopefully. It was tough trying to put it into words but you have expounded and found a way to word it very elegantly. I appreciate that.

Well, it's a topic I've played with for a while actually, in terms of trying to find flexible but intuitive ways to describe experience and self-direction, which can hopefully be applied practically. See for instance: The Patterning of Experience, although without any background context that might seem a bit stark.

...You're in my queue. So, you need to add a [META] tag and not have all the shouty capitals. Also, looking at it, you really should say how exactly "God" relates to the Mandela Effect, and what your definition of God is.

I get the feeling you are saying something along the lines of: "consciousness" is fundamental and eternal, experiencing never ends, there are numerous world-states all existing simultaneously. However, it does come across very clearly (to people who haven't thought along those lines before). Most people interpret "God" as referring to an entity god, with all the religious connotations of that. It's going to seem off-topic.

So, maybe do a new draft and create a new post?

Yeah, it's an emotive topic - it's the foundation of our very existence, after all! I quite understand. However, it's important I think to view posts this way: think of them as the starting point for an expression and discussion. This means laying out your thinking, not as fact or declaration, but as a proposal, in a way that allows people to follow your reasoning and engage intelligently. Then everyone benefits: others get a new view, and you gets to see your own ideas through the eyes of others via their responses (just as happened here with our little exchange). The most important thing, though, is to make sure it's clear how, exactly, it relates to the Mandela Effect, so that everyone understands the context, and starts from the same place. Cheers!

POST: [Theory] The Mandela Effect Is A Test Of Mass Microwave Brainwashing (/r/MandelaEffect/)

If changing realities is not the answer, and we don't want to go "full satellite", could it be that we never really experience an external world anyway as such; we wander about in a dream with occasional corrections?

[QUOTE]

When I got in the darkroom, I realized that I could very faintly see the big table in the middle of the room with all its individual tubs of developer, stop, and fixer. This disturbed me, since a darkroom is supposed to be absolutely dark. I reached for the corner of the table, and when my hand reached it, there was nothing there. The table immediately vanished from my sight. I fumbled around a bit, found the table by feel, and instantly it popped back into view in a new, and "correct" location. Though this image was faint, it was definitely a visual image, indistinguishable from what I would have seen had there been a very dim light in the room that was just barely above the threshold of perception. But, given the disappearing and reappearing act the table put on, it was also clearly coming from inside my mind, not from any "objective physical reality."
-- Darkroom Vision & Chef Hats & Dreams

[END OF QUOTE]

What constitutes a "correction" and how that comes about would, in this case, be up for debate. And also pretty much impossible to answer, since there would be no way of perceiving such a process "from the outside" - a problem shared by all the proposed explanations of the Mandela Effect.

I see in dark rooms. A little. When I wave my hand or something moves, I DEFINITELY see it. I thought that was by design. You're saying that's not possible for normal humans???

If you subscribe to the pure "we see directly with our eyes" assumption, then in a completely dark room you should see nothing at all. If you go with something like "we perceive all experiences within our minds, as a 'perceptual space' filled with sensations and perceptions and thoughts and objects", then it's less of a problem, since all information will contribute to the final experience, including the knowledge that you are waving your arm. The information will autocomplete into a complete world. This makes more sense anyway really. After all, you don't really "see visuals" - rather, you "experience objects/meaning". If there's a mug of coffee on the desk, you perceive "a mug of coffee", rather than a collection of coloured shapes. If you closed your eyes and held the handle of that mug, you would perceive "my hand holding a a mug of coffee" rather than just an abstract sensation of "shaped solidity" floating in space.

POST: [THEORY]Possible psychological explanations for the Mandela Theory? (/r/MandelaEffect/)

Q1: To this point yes, but eventually things may be explainable. For example, Cluster Illusion is a similar phenomena with a set psychological explanation. So is Placebo. And yeah, I do agree with you. Though I do think categorizing things can be benefitial, since not knowing exactly what something is or what causes it can cause people great distress at times.

Does placebo have an explanation - or clustering illusion for that matter? Rather than being a naming for an observation, or a type of experience. For example, if "placebo" is the term for "getting a result despite having taken no active ingredient" then that is not an explanation, it's an observation. If "clustering illusion" is "seeing a pattern in what is actually a random sequence of numbers or events" then it is also a naming, and specifically only for when you have an independent observation of the data "actually" being random. If you've bought a red car and then see lots of red cars everywhere, you might have had an experience of "clustering", but without an independent reference (pre-known dataset) we couldn't say it was a "clustering illusion", and if we did then it still wouldn't be an explanation. You get the idea: naming and categorisation is not explanation. This is a big problem when it comes to extrapolating the conclusions of, say, small psychological studies conducted in specific conditions, as if they constituted broadly applicable models, when there is no proposed model usually (or not one a physicist or neuroscientist or even philosopher would recognise as such). I think this is a hurdle for getting anywhere with the Mandela Effect, because we can say "because brains" or "because fallibility" for anything - but it's worthless unless we can describe how, exactly, it explains a specific instance of an ME. It's really the objective-subjective boundary problem again, in the limit.

POST: [THEORY] The Wonders of Language Processing & Cognitive Distortions (/r/MandelaEffect/)

who missed the correct answer...

And really, it kind of destroys the idea of there being a "correct answer" at all, as opposed to a consensus answer. And it highlights how quickly we adopt a "fact" based on very few observations, forever-after referring to our thought version of something rather than our sensory version. But even that is problematic - because as you point out, our so-called sensory version (better to call it our perceptual version perhaps?) often just is our thought version. It's fascinating to see "correction" in action. If you reading a book and misread a word, if you are attentive and read with an open focus attention (taking in more of the page rather than focusing too much on single words), you can actually see your misread word shift to the "right" version. You really did see the wrong word before the context forced you to revise it to the right word. This makes words like "see" misleading, because in everyday conversation we tend to adopt a naive model of vision (that we are literally and directly apprehending a world). Better perhaps to say we are "experiencing" - experiencing the conclusions about our surroundings based on all possible information, sensory and conceptual, appearing as a results in our "perceptual mind-space". How this connects to the Mandela Effect, and even our concepts of an "objective world", is probably not easily examined and articulated. What it does do, is highlight that we have very poor models when it comes to perception and memory. Actually, I think we have pretty much no genuine models at all.

This explains everything! Shut down the subreddit...

Is that phrase set up as a macro? ;-) It doesn't explain everything, or perhaps even anything, but it raises interesting avenues for thought and discussion, especially if we read between the lines a little.

Well, the mods are siding with those that say it's all in our head now so I guess I'm done here.

No... the mods aren't taking "sides" at all. Rather, if someone spends time laying out their theory in a non-dismissive way like OP has, then it's an opportunity to dig deeper and either find ideas in it to use, or to point out the problems with the suggestion - describing why you think it's not a good explanation, and perhaps outlining a better alternative if possible. For sure, there are times when someone says "hey everyone knows brains are forgetful" without saying how exactly it accounts for things, then a bit of snark is understandable. (Note: if someone says "hey it's obviously many-worlds" without any detail, the same would apply surely?) But when someone is genuinely trying to put together a theory, then it's an opportunity to work through some ideas. There's nothing wrong with being sincerely wrong, if that's what it turns out to be, and getting an informative response outlining why. If people aren't willing to do that, to put together a proper response, then there's not much point - and it wouldn't be a surprise if nobody took this stuff seriously. (It's already a struggle to get people to describe their experiences in more detail than "I remember it different", and their theories in more detail than "it's false memories" or "it's timelines".)

POST: [THEORY] Could the Mandela Effect be the job of our powerful and underestimated mind (subconscious)? (/r/MandelaEffect/)

So... What is a "subconscious mind", exactly? Where is it, what is it made from, and how does it work? Or is it just a sort of magic "black box" that explains away anything that we put in it?

Q1: Really? If you don't know, just search.
[<http://www.bbc.com/future/story/20150217-how-smart-is-your-subconscious>]

That's sort of my point - it's not an answer, or a thing, it's a concept. Note that I'm not offering a particular explanation for Mandela Effects or the examples you list, I'm just pointing out that "the subconscious" is not an explanation for anything, since it amounts to literally just a category. It's a black box concept to which we assign activities which we infer must occur prior to our conscious experience. At best it's a placeholder for current ignorance, at worse it smuggles in baseless assumptions about how the mind works. Basically, it amounts to saying: "the brain does it... somehow".

Q1: It is a thing. Some stuff don't go in our conscious, it goes straight to the sub-conscious, without knowledge, stuff that you're afraid or that our mind thought that we couldn't handle / understand. I understand what you meant, but the sub-conscious can be a REAL explanation, why not? Due the way it works, or like the scientists and psychologists said how it would work, it should explain pretty well. But i get your point, that's why i posted as a theory.

My point is, it's not even a theory, because it has no content, no mechanism - it can't describe anything in terms of cause-effect relationships and it can't make any predictions. I get what you are trying to say, which is: why contemplate more unusual explanations when it is possible that the brain is responsible somehow? Why keep pondering?

I'd say:

- Because it's fun and interesting. :-)
- Because until there's a detailed model of mind, perception and memory that can be tied to subjective experience, then "the brain did it" is not an explanation at all - it's just an avenue of investigation.
- We currently have no understanding of what perception and memory actually are, or any concept of the form a theory of consciousness would take. So even in that area, we wouldn't stop thinking about the possibilities just because we think it's brain-related.
- Because science is about cataloguing experiences and then coming up with concepts and models to describe them. The experiences dictate the possible models; the current models do not dictate the possible experiences.
- Models are not "what is really happening" and they do not cause phenomena; they are parallel descriptions of certain elements of phenomena. Who knows? Perhaps something based on the concept of "parallel universes" might turn out to be the the more useful description, one that can be tested.

Anyway, you get the idea. You have, quite rightly, said "hey maybe this is all the brain doing stuff in the background", as many people have said before you. It's a good starting point for one line of investigation...

Next up: Describing how exactly it explains specific instances of the Mandela Effect experience. For example, a librarian who spent her days reading Berenstain Bears books and then one day she finds it's changed to Berenstein (prior to ever hearing of "the effect"). If it's the brain spontaneously doing something, then what was that and what was the mechanism? Why did she one day experience it apparently changing? Why does she have memories of the encountering "-stein" spelling at all? And so on. It's going into the details that's interesting.

Kinda like dark matter is a thing but we don't understand or know exactly what it is

To some extent, yes: in the sense that dark matter isn't really a thing, it's an absence, a lack of an observation. The name for a gap rather than the name of an actual structure, while implying that the content of the gap will be of a certain type. Like the planet Vulcan presumed the content of its gap was going to be in the form of a planet. However, the proposal of dark matter ties to fairly specific anomalies in measurement, whereas "the subconscious" is much broader and doesn't tie to measurements as such. It's the equivalent of invoking a God (of which "computer operating system" is just a modern metaphor) to explain where a vast array of unexplained things come from. Note: I mean "unexplained" in the sense of nobody having invented a well-structured "parallel story" about what's happening, which aligns with observations. In matters of description, it's all about the number of "observational touch-points" that connect the story to what is happening. In that sense - having no internal touch-points - "the subconscious mind" is very much like dark matter.

POST: Another Bible ME Matthew 7:1 Judge not... (/r/MandelaEffect/)

Something to be careful of: There isn't just one Bible, of course, there are hundreds of versions and translations, in many editions. It wasn't originally written in English, after all. Unless it is the same Bible that has changed - same version and edition definitely, referring to the same physical book ideally - then you are quite possibly not talking about an ME here. For Matthew 7:1, for example, we have:

- King James Bible: Judge not, that ye be not judged.
- English Standard Version: Judge not, that you be not judged.
- Berean Literal Bible: Do not judge, lest you should be judged.
- Aramaic Bible in Plain English: You shall not judge, lest you be judged.

And many more. Also, are you sure you mean "least" rather than "lest" in your original quotation? The meaning is quite different, and it would be an easy error to make (most of us being unfamiliar with "lest" when we first encounter the passage). Anyway, I'd say the Bible is definitely an example where, there not being a single definitive reference version, we can be susceptible to the "kinda always sorta remembered it that way" thing if we don't have "specific personal memories" associated with our encounter with a passage. It's at least something to consider.

Who regularly reads a Berean Literal Bible or Aramaic Bible in Plain English?

True enough. They're just examples, though, selected from the larger collection to show the two main versions of the phrase, and how there are also minor differences within each main version. If you click the link [<https://biblehub.com/matthew/7-1.htm>], there are about 25 versions of the passage from different sources. It really doesn't much matter who reads this or that version if the poster doesn't have a particular memory of where they first knew the phrase from, and where they encountered the "different"

phrase. This is even worse if they didn't actually see it in an actual Bible either time, and just encountered it as an isolated textual or verbal quotation with no other context. That's why the sidebar defines a Mandela Effect as an experience where "a global fact - one they feel they know to be true and have specific personal memories for - has apparently changed". As in: ideally, you can recall the details of where and how you personally experienced the "fact". Otherwise it might just be a "kinda sorta remember" impression you had, and only recently paid proper attention to for the first time.

POST: This needs to stop NOW (/r/MandelaEffect/)

Occum's razor doesn't uses "simple" to mean "most likely" or based on the fewest assumptions

Yeah. It's definitely worth thinking more deeply about what Occam's Razor actually entails, rather than the one-liner retort it has often become. Reproducing a previous comment:

[What Occam says:] It's not really that "the simplest explanation is the best" or inherently superior, it's more like:

- "Given two models with the same explanatory power, it is usually better to choose the one which introduces the least number of conceptual entities."

It doesn't say anything about one being inherently "more true", or that the world itself follows some sort of "simplicity rule", nor is there a restriction on assumptions or new concepts. In fact, if an explanation isn't really a model - as in, it has predictive power - then the rule is meaningless. Otherwise Occam would dictate that the best explanation for everything is simply that we are a "consciousness space" which "takes on the shape of" a subjective sensory experience, with no "world" behind it at all!

Of course, beyond that, there are many reasons to choose a more complex model: sometimes because it provides an "understandable" model rather than one which simply predicts results but is opaque; sometimes because the more complex model shares a form with other models in other areas, and allows the use of calculation or reasoning approaches which have already been established elsewhere. (Mathematics, for example, is full of areas where something is transformed into a certain format for "no reason" - other than it allows a certain approach to be used.)

Really, many "explanations" being proposed here over at the glitch subreddit basically have no explanatory power at all. If there's no way to test a description in terms of predictive power or by applying it to a dataset, then it's not really an explanation. It's not that saying something is "parallel universes" or "virtual realities" or a "false memory" or "confirmation bias" or "brain seizure" is wrong as such; it's that it is meaningless in the sense that it is non-scientific. It's just a hand-waving "plausible story". Of course, pretty much all of our ideas for what happened in these reports is hand-waving story-making - but that's actually part of what makes it good: an exercise in flexing our powers of imagination and reasoning, and spotting the assumptions we use in everyday life without perhaps recognising they are assumptions, and maybe just having fun playfully exploring ideas collaboratively (rather than in combat, hopefully). Plausible stories done in a detailed rigorous way, gives you philosophy.

Using Occam's razor to prove a scientific theory makes me lol. Hahaha. I don't understand complex unknowns!!! If I can't explain what's going on, it's not real!!! Nothing scientific about that "phrase" if you're going to use a phrase to back your theories up, you better be able to use imagination and deduction to back Mandela effect up. Get outta here with your time wasting Occam's razor - has no place in a forum where people are theorizing about wild scientific theories

Again, I'm not sure whether you are agreeing with me, or not. Or if you actually read the comment. Still, I'll choose "agreement" again, since that's more agreeable to me!

POST: People seriously believe this? (/r/MandelaEffect/)

To be clear, though: It's important that any explanation for the experience - be that "remembered it wrong" or "parallel universes", say, neither of which are actually explanations in any case - should be kept apart from the experience itself. People do have the experience; the nature of that experience is up for grabs. (And happens to present major problems for proper investigation.)

"Bad memories" with some generalised references to psychological effects (usually taken out of context) isn't actually a mechanism; "multiverses" that can't be observed don't cut it either for that purpose. If an explanation can't be tested - actually tested, rather than just supposed as "likely" based on common assumptions, many of which are rather recent and quite possibility transitory - then it doesn't count for much as a scientific account, or indeed any account at all. For example, as per your example, it's rather getting ahead of ourselves to say that "the universe changed". In fact, we never actually observe a universe as such. Rather, we experience a series of sensory moments arising within perception, for which the notion of a "world" as some sort of "place", with ourselves as an object located within it, has merely become the dominant narrative.

POST: Scientists believe Parallel Universes ARE interacting. Is this the cause of the 'Mandela Effect'? (/r/MandelaEffect/)

Sorry for the late reply, your comment was stuck in the spam filter until I happened to look back at this thread! Excuse any slight repetition due to vague recall. I agree with your comment about "what if" contemplation. As per Paul Feyerabend, I tend to think physics (for example) proceeds by a somewhat "anything goes" process in reality, with post-hoc justifications afterwards to clean up the story. And that is just fine. However, this makes it doubly important to adopt a "meta" perspective on the activity itself. Specifically, as I said above, the nature of descriptions themselves. I think the idea that our connecting concepts are "true" is somewhat recent, and has become prominent as philosophy has receded as a component in our scientific outlooks. (Even though the view that our descriptions are true is itself a hidden philosophical position.)

This is ultimately what George Ellis is pointing out in his essay, and why Stephen Hawking makes seemingly foolish grandiose statements occasionally, and why N David Mermin makes his comment about the "reification of abstraction". Not long ago, this wouldn't have need to be stated! The idea that the world was really made from "atoms" (rather that "the world", a concept, being constructed from "atoms", another concept); or that light really was a wave or a particle (two concepts) and that it having aspects of both ideas was a problem; or that "gravity" (loosely speaking, the name of a description) is what really causes things to fall down, would have seemed ridiculous. But that is how we talk, mostly, and it's at the root of a lot of the threads we see here and in more "scientific" publications: this weird muddle of the idea of what is "true" or "real" because there is no firm platform upon which the discussion is occurring. Ideas, then, I'd suggest, are about being "effective": are they useful as a thinking tool, or as a predictive tool. Either is fine. Arguments (1) and (2) are both permitted, provided descriptions are viewed in this light, put in their proper context relative to our direct experience. That is, a blend of (1) a conceptual framework which acts as a useful template of relationships in order to facilitate thinking and (2) an abstraction and codification of repeatable observations, with a greater or lesser number of "observational touch-points" for direct experience, but still never getting "behind" direct experience.

POST: I have a theory about why these happen (/r/MandelaEffect/)

I think the same applies here as to quantum-physics-inspired multiple universes descriptions. From a previous comment which then goes into more depth:

I'm with George Ellis on this, as regards quantum theory, string theory and multiverses and so on. Although it might be interesting and fun to consider philosophically, it is essentially meaningless scientifically. Having said that, the Mandela Effect is a philosophical or metaphysical issue, really, and not a scientific one, so this is not necessarily a problem for the subject as a whole; it just means we need to be mindful of what we focus upon.

So, while it is fun to consider these narratives (and they are narratives) about our experiences, they are not testable theories. In fact, anything "outside of" our experience is not testable, and your description is mostly that. We might recognise that there are patterns which are consistent with the idea that something is happening - that are "as if" it were true - but that's not the same thing. Which is fine, of course, because scientific theories aren't about "what is really happening" anyway; they are useful abstractions. However, when a description as almost no "observational touch-points" at all (that is, the description has very few observable components relative to the complexity of its conceptual framework) then the sense in which it is a useful model, rather than an enjoyable story, is questionable.

I really don't agree that "actual scientists" are proposing that we are living in a simulation, although they might engage in such "gee-whiz" discussions for popular-science-type magazines and programmes, as part of their promotional activities. (Nick Bostrom is not a good example.) If anything, one's treatment of such a hypothesis is a good indicator as to what extent you are an "actual scientist"!

Q1: I like your comment, until the part where you claim you don't agree with the unarguable reality that scientists are actually working with this theory seriously and calculatedly. I mean, that's cool i guess, but it's the reality whether you believe it or not. And why the random disclaimer about how Bostrum doesn't count? Confusing.

Bah, I knew I should have expanded on that bit of wordplay! Apologies.

So, that was intended to be a shorthand for a few things implied by the comment and the linked comment. For example, that one shouldn't conflate "working in a scientific role" with "this being a scientific hypothesis". The phrasing of "actual cosmologists and other scientists" heavily implies that the simulation hypothesis is itself a scientific hypothesis. As per the George Ellis article (to take one view), in what sense is someone being an "actual scientist" if they are engaging in what amounts to observationally-untethered philosophical musings?

Meanwhile, when I suggested that Nick Bostrom was "not a good example" in this context, it's because his Are You Living in a Computer Simulation? [<https://simulation-argument.com/simulation/>] paper (hosted on his The Simulation Argument webpage [<https://simulation-argument.com/>]) is sort of, intentionally or not, the logic equivalent of a wordplay joke. The amount of coverage it has got in the media as a "scientific" idea is largely to do with the ease with which it can be fashioned into a fun, engaging, pop-culture story in mainstream publications (in articles such as this [<https://www.theguardian.com/technology/2016/oct/11/simulated-world-elon-musk-the-matrix>] and this [<http://theantimedia.org/tech-billionaires-matrix/>], for instance).

Moving past all that, though, I suggest the important question to ask would be: "what is the relationship between one's ongoing experience and any particular description of that experience?" and how the "simulation hypothesis" fits into whatever the answer is. I think all of these "simulation" ideas can ultimately be reduced to the idea - the long-established and foundational idea - that descriptions don't explain "what is happening", rather they are codifications of regularities in observations (which are themselves an abstracted subset of experiences), by us. The end-point of the simulation hypothesis is, then, really just a rediscovery of the fact that the standard description is just that: a description, a useful abstraction, and isn't intended to be more than that (as per the N David Mermin article in the linked comment). The "laws" of physics aren't like legal laws which the universe must "obey"; they are "observed regularities" we have woven into a conceptual framework. Any ideas about "breaking out of The Matrix", a la Musk, are a slightly mangled version of "recognising that your experience does not in fact arise within a conceptual framework", and then trying to do some things which are not "allowed". But they were never "forbidden" in the first place. The "simulation" stuff itself is just distracting fluff on top of this.

POST: Do the devs not care that scientist players are reverse engineering the game? (/r/outside/)

Devs don't mind at all. Having implemented the IGOE (infinite granularity of experience) generation module, they know that the closer the scientist players look, the more detail they'll discover and have to explain, forever. There is in fact no underlying structure accessible in-game at all. Periodic in-game global catastrophes and wars ensure this discovery process gets reset regularly before too many players are confronted with the Unbearable Void at the core of existence.

POST: If there are no bugs, how do you explain what some players (such as those at /r/Glitch_in_the_Matrix) experience? (/r/outside/)

It's actually due to a labour-saving device embedded into the game. You'll notice that in Outside's in-game video games, there is often a 'fast travel' function to let you jump from one location to the next quickly? Well, Outside has the equivalent for events. I mean, you could wait for ages to encounter the right person or objects to achieve a task if you had to just wander about looking for it. So, the game cheats a little. When you intend something, the game not only generates the appropriate thought experiences and actions according to your goal, it also tweaks the environment too, to move it towards your aim. That's why when you think about someone, they show up or ring shortly afterwards, or when you're job-hunting, you bump into an old friend from years ago who happens to know of an opportunity. Unfortunately, sometimes the servers screw up on processing, and prioritise this function over providing a consistent, smooth gaming sensation, in an attempt to improve the overall player experience. Hence occasional quirks or sudden jumps in game environment for particular users, as the game stutters ahead to the target state at the expense of physical realism.

POST: The You know what... (/r/outside/)

MAIN QUEST.... like honestly I have looked everywhere I am level 20 and still no idea where it is. I have completed all the attribute placement and intelligence upgrades. I still haven't found the main quest... Thoughts?

Each player has an assigned quest with many sub-quests, however this is revealed to the player through his own spontaneous actions and encounters and responses, and things called 'desires', rather than explicitly stated. In fact, the main storyline may only be discernible in retrospect, during the final montage sequence that runs when the game is completed. What is vital, then, is to not "force" a direction of play - otherwise you may miss internal and external clues as to your best path. Stay relaxed, be attentive, respond to intuition - and hopefully your main quest will find you!

A1: There is no definitive main quest, the game is open ended, you set yourself targets and try to reach them for the sake of your character and the other players you interact with. Every little quest you do is connected with someone else's quests in one way or another, and that's what makes this game beautiful.

Some say that there is a victory montage, where scenes of various triumphs that occurred during the game are played onscreen.

POST: I wonder, to what extent the particle physics and dynamics are in Outside. (/r/outside/)

Outside's reality is created and served up on an as-required basis. Discovery is actually creation; to open door for the first time is to spark the creation of the scene beyond, in line with past expectations/recall of all contributing players. Before we discovered atoms, there were no such thing. When we looked closer, we created sub-atomic particles, and so on. The more we look, the more we find. There is always an answer returned to any question that we ask. Meanwhile, there is a retro-causal 'narrative consistency' element enforced so things don't get too out of whack. One of the implications of this is, that when something is discovered-created somewhere in the game - a new "habit" is established - that something becomes easier to observe elsewhere in the world. New crystalline structures are created by a lab in France, suddenly it's easier to create them elsewhere in the world; rats learn a maze in London, rats in California can now navigate mazes more easily.

(Rupert Sheldrake has done research into this aspect of the game, calling it 'morphic resonance': forms created at one point in the game universe become available elsewhere subsequently.)

POST: Whats "Outside" Of Outside? (/r/outside/)

There is no outside of Outside, because Outside is inside [POST: Why did the devs implement dreams?]. Beyond this experience, there is no other "you" or "body" to get up. Your bodily experience is actually part of Outside: you don't actually have a body other than this. When your play of Outside ends, not only will the game world fade away from your experience, but so will the experience of being a "human" and all that goes with it - revealing that this too was part of the game environment all along.

Ohhhh so we're NPCs.

No, but you're not your character either.

Well we're not not our character, so what does that make us? It would seem the only reasonable conclusion is that we're constructs generated by the procedural component of the game engine.

I suppose all we can really say is that we are "that which experiences the game". I don't think we can know for sure what we truly are until we finish the game. Sure, the fact that we dream might give us a hint (it seems strange that this world disappears and is replaced for a while, and the replacement can seem even more real than the usual Outside environments). And I think that we are not actually "Triffgits" or "TriumphantGeorge". But all we can be sure of right now is that:

- There is a game, whatever its true nature,
- I am experiencing it, whatever my true nature is.

Without being able to see the game - or ourselves - "from the outside" it's hard to say anything more at present.

Descartes would be proud if he were still playing.

Well, it's all theatre, mind.

POST: Does anybody know how to activate/ go into third person? (/r/outside/)

Supposedly the player's camera perspective and the avatar location are not necessarily bound together, and there's a glitch which can be used to invoke 3rd person view [<https://www.oniros.fr/A1417.pdf>]. Unfortunately, I don't think you can move your avatar when using this - only your perspective cam.

POST: Does magic exist in Outside? (/r/outside/)

Although there's a danger that you might encounter another wizard before you get there, one who's looking to play the "sacrifice" mini-game in order to get a power-up. So it's probably best to stay away from islands where there is a lot of wicker, for instance.

POST: My friend wants to quit playing outside. How do I convince him not to quit? (/r/outside/)

It's possible that we can never truly quit playing Outside or one of its variants completely, because we are not actually players at all; we are that-which-runs-games. This means that if someone is finding it difficult to endure their current game scenario, a couple of things may help. The first is simply having other players make it known that they are online and are supportive in full multiplayer mode - available to help them deal with the current content of their game whenever called upon. This is the right approach during a fellow player crisis, when a level has hit a difficulty spike. The second, perhaps best suited to a post-crisis moment, is to contemplate the underlying nature of games in general - in other words, the context of our gameplay rather than just the content. With a deeper understanding of what a game actually is and our relationship to it, we might be better equipped to deal with future challenging levels - and even customise our own missions eventually to some extent. Most important, though, is for you to realise that you cannot play another player's game for them. You can only offer assistance to the extent that your character and the larger game world permits, and no more. Whatever the final score is when your friend's current run-through does finally end, it was always their game to play, not yours.

POST: Why did the devs implement dreams? (/r/outside/)

These aren't features, they are the mechanics of how Outside operates!

You are not actually the character you play in Outside, rather you are an open "game-space" which connects to Outside and adopts a particular perspective in the Outside game environment. In periods of reduced activity, your "game-space" disconnects and either connects to another pre-existing game-world, or constructs one on its own, seeded by random data fluctuations. You can see this happening in the case of hypnogogia and fragmentary imagery.

Generally these worlds are more flexible than Outside, because to save on processor and memory power, all games function on a co-creation, procedural expectation/recall-based engine - so the more players there are, the more stable a game world becomes.

Because Outside is the main, default subscription for all current players there (part of the terms and conditions), you always reconnect to Outside whenever other connections collapse. You can prove this to yourself by trying to observe the disconnection/reconnection in progress, or illustrate it via a thought experiment:

- Sit comfortably. Now imagine turning off your senses one by one:
- Turn off vision. Are you still there?
- Turn off sound. Still there?
- Turn off bodily sensations, such as the feeling of the chair beneath you. Uh-huh?
- Turn off thoughts. Where/what are you now?
- Some people are left with a fuzzy sense of being "located". This is just a residual thought. Turn that off too.

You're still there, you realise; you are a wide-open "aware space" in which those other experiences appeared. Outside is the generator of those experiences, including the body and many of the spontaneous thoughts and actions. Only a subset of change: intentional change, is actually your influence. The rest is just part of the game experience. There are rumours of players who have developed limited, dev-like "magickal" powers based on "intentional" procedures, but since these would also produce a revised game narrative to cover their tracks - 'narrative/experiential coherence' is enforced religiously by the game engine - this is hard to confirm.

When you eventually complete Outside, after the final montage sequence, the connection is terminated and the 'world' within you disappears - followed by your next adventure, should you choose to accept it!

So what happens when the game builds a world withing my "dream world"?

It doesn't. You're actually connecting to another server group completely, which is running a different instance of the game engine that Outside runs on, perhaps one with no players except for you.

Since the game engine works by reflecting your expectations/recall back at you, a "dream world" is then spontaneously built for you to experience. Since your default subscription is to Outside, though, when that dream world fails, you are generally reconnected to Outside with the "waking up" intro.

holy shit! you really understand this. very well done.

Just seeing it how it is! ;-)

POST: Randomly stumbled on this guy's posts... (/r/DimensionJumping/)

The point is really that no particular experience is special; all experiences are at the same "level" because there is only one "level". ("You-as-awareness which 'takes on the shape of' states of experience" is one way to describe it, but really that is too fussy and, as mentioned below, there's inherently no positive way to describe this situation. Which is why people do the whole "not this, not that" thing.)

Even an "enlightenment experience", then, is just more content - it's just that the content is not formatted in the same way as the usual "everyday world" content. But it's still just content. Good for noting that the larger situation is "not this, not that", but not much more than that.

Analogy: imagine having spent your whole life thinking about people in cars driving roads, and not having any other thoughts, then one day you have a thought about a man climbing a hill in a vast open landscape. The new thought undercuts the formatting of your habitual thought, opens you up - but it's still another thought. (Note, though, that in this analogy I'm not saying that such experiences are "just a thought about something". I mean to indicate that experiences themselves are essentially "unfolding thoughts" in type.)

So, you can watch whatever you like, and conceptualise things however you want, and read this or that, and listen to this person or that, but all that will be just more content, all with the same context.

The purpose, then, of doing a particular exercise or unpacking a certain way of thinking about things, is to notice via direct experience and experimentation that ultimately there is no fundamental formatting. It's not really an experience (no particular content), so much as a deduction and/with an insight about all experiences, impersonally.

This is why when the DJ subreddit was running, we'd often say that it was about exploring "the nature of experience" and also "the nature of descriptions about experience". Noting the the latter is just an example of the former, helps dodge a lot of needless seeking around (which can be fun, but it's nice to have the choice to do it or not without misunderstanding what such a "seeking experience" is).

POST: How to use the Law of Attraction on a day to day basis?

As another commenter highlighted, there's nothing special or separate about LOA - it's just a recognition of how your personal world operates anyway, and a particular way of thinking about this for deliberate use. Day-to-day use means to be active in what patterns you allow to become dominant in your ongoing experience. All self-help and LOA and magick type teachings are founded on the same insights, something along the lines of the extract below.

All Thoughts Are Facts

On using the world-as-thought perspective as a way to create deliberate synchronicity and therefore particular scenes:

- You are an "open conscious space" in which thoughts arise. The apparent world is basically a very bright, stable, full 3D multi-sensory, immersive strand of thought.
- The world evolves by the accumulation of observations or "facts".
- Every thought you have about the world is literally adding a new fact to the world.
- Thoughts which randomly arise simply reveal the current state of the world.
- If you deliberately think a thought, then you are deliberately adding a new fact to the world. (This is how to make changes.)
- The more intense the thought, the stronger the influence of that “fact” upon your experience.
- If you respond emotionally to a random thought, then you are in effect re-thinking it as a more intense thought, meaning it will contribute more. (Hence fearful thoughts tend to increase the prevalence of fear-related experiences; however this works just as well for nice-emotion thoughts.)
- If you “grasp” onto a thought then you are persisting it - you are maintaining it at its present level of intensity and not letting it fade and be “forgotten”.

Things such as detachment, surrender, abandoning yourself, and so on, are all about letting the current dominant thoughts or “facts” become softer and fade, letting the world shift freely, and allowing other thoughts to shift into prominence.

Q1: *How to use the Law of Attraction on a day to day basis?*

Segment *intending*

Abraham's concept of segment intending simply involves taking time, as we go through each day, to declare what we would like to have happen during the next "segment" of our experience. We may have, for example, the overall intention for clear communication, but that intention is not very useful for the life-segment of going somewhere in the car. For that, we might want to take time to specify that we enjoy our trip, that it is smooth and pleasurable, and that we arrive safely. When we call someone on the telephone, we can spend a moment first imagining what we want to have happen in the conversation. Here is where clear communication might be an appropriate intention. We should use segment intending for the different segments of our day, all day long. This, says Abraham, will "prepave" our future. Once we start mentally and emotionally "creating" a smooth journey everytime we go out in our car, for example, it is more likely to happen this time, and even more so the next time, and the next. By this prepaving, we can divert negative events that otherwise might have made their way to us through previous miscreating.

I hadn't heard of that before and it's a really nice framing concept. Like taking a pause between "scenes" to script-write what's going to happen in the next part of the "movie". And "pre-paving" is a great word!

A lot of this is about being slightly detached and staying aware, I guess, so that you do the amendments and directions in real-time - rather than having to periodically clean up messes and intend your way out of them again when it gets desperate.

POST: People attracting De*th (Paris Issue) Are they doing this to them selves? (/r/lawofattraction/)

I think this area highlights why the concept of "attraction" isn't actually very helpful. While it provides a simple picture of there being things "out there" that you want, and them "moving towards you" depending on what you think (or how you manage yourself), the "attraction" metaphor doesn't really extend very well to other situations. Among other things, it implies a level of choosing and control and "deserving" which isn't really there. An alternative might be to think of ourselves as being born with a pre-existing "landscape of events". You only experience a small piece of that landscape in your senses at a time as you travel across it, however the whole landscape is there in the background. "LoA" is the recognition that the landscape can be modified deliberately, even the parts you are not experiencing right now - in other words, that experiences are local but intentional change applies globally - plus a proposed method of doing so. However, this is all done "in the blind" because you can't experience something prior to experiencing it. The shape of the landscape is not your "fault", therefore. Although it might be in consciousness, it was not consciously created.

POST: Law of Attraction: The Science of Attracting More of What You Want and Less of What You Don't (/r/lawofattraction/)

what is the purpose of this thread? i was expecting something in the description lol

Perhaps it's an essay question. Here is a title for your essay, please write 1000 words before next session. Next Week: "Reddit is a source of frustratingly incomplete posts: true or false?"

:) Haha. Nice to meet you. Any thoughts that you have about LoA? Since the OP just put this up maybe we should chat... or perhaps we should not. Up to you.

Why not? There's a big empty space up there. Hmm. Maybe that's the clever plan of OP: By making the post he is acting as if there is a description and, sure enough, we are creating it for him! LOA in action! :-)

Yup. But the fact that the OP has a paid website for LoA training is what makes me ever so slightly suspicious.

Oh yeah, I just realised who/what OP was - they've been doing link posts all week. Those blog articles are actually okay, but I'm a bit suspicious of anyone who charges for LOA type stuff. Fine to write a book or give lectures (if you've got new things to say), but creating a subscription "club" and having charged phone support? Strongly disagree.

Exactly! But we can talk amongst ourself tho. So how did you find out about the LoA?

I was interested in "the nature of reality" and all that sort of thing (science and philosophy but also imagination), then read about "chaos magick" and that stuff (things like Alan Chapman and Ramsay Dukes). So I see LOA as one version or approach from that group: reality-shifting, you might call it. Always been looking for better ways to think about the world, and to use it.

You?

Q1: Hmm, that's very interesting. Well, seeing that I'm 22, the first exposure I had to this stuff was when The Secret came out. I've always been spiritual so it did sorta interest me but I didn't really invest myself in it. Fast forward to 2012, I was in a very dark time and had been reading the book by Norman Vincent Peale about positive thinking and mid way through that I watched The Secret again and then discovered Abraham Hicks. That's really how I got into it in a big way. Since then my life has changed dramatically - for the better. During my journey, I came into contact with other such methods such as chaos magick and other stuff very recently but can't say that I have read up on it in any way close to that of the way I have done with LoA. If I'm not mistaken, chaos magick is what includes sigils and stuff, right? That's some powerful stuff.

I was aware of The Secret but never really looked into it, because it sounded like a half-arsed version of something else, I figured. But then it seems to have got people interested in "this stuff" and that's a good thing. Chaos magick has sigils and stuff but really all of this, I'd say, is about recognising that the world is "made from imagery" that has become stable, and so intention and imagery are how you redirect it from its current path (my attempt at a metaphor: The Imagination Room). It's about deliberately, wilfully creating synchronicity. So it doesn't really matter what tool you use, I think, so long as you thoroughly think that doing "this" means "that" will happen. Because if everything is imagination made solid, then everything is a sort of idea or metaphor. (Alan Chapman makes that point in the opening of that book: decide that this means that, then do this, and you'll experience that.)

I guess it means: Follow the approach that you feel you can get behind most completely. The LOA is pretty good if you just get behind it with faith, but it doesn't have much of an explanation behind it for the details.

That's actually very interesting. I really find what you said in Paragraph 2 and 3 to be very interesting. You're obviously so much further ahead in this. I know this is silly, but would you mind telling me of any particular instance that really strikes you as "WOW!" that you created?

The first things I did were things like choosing which exam questions to study (exact results), and "undoing" things that happened (never mentioned again, Ctrl-Z magic!). More striking is just getting patterns to appear deliberately in your life, because it shows you that reality is far more straightforward in some ways than we assume.

I had a post...

Found it - actually, I posted about the synchronicity thing here before. The only decent attempt I've seen at writing up that side of things in a book is Kirby Surprise's (yeah great name) Synchronicity - there's a good interview with him here. Check that out, but his "fictional explanation" is more detailed than it needs to be.

Copy-pasted related post below, in case you want to experiment.

Fun With Owls

Anyway, so the fun thing to do is simply spend a few moments imagining (say) an owl in the space in front of you, as it would be there if you were seeing it (i.e. don't think about it but actually put "over there"), really feel it to be there, with the firm intention that more owls are going to fill your life. Decide that doing this imagining means that you will see more owls. And then see what happens. At first, people see more owl imagery in their life and they think: hey, those owls were always there, I'm just noticing them more. But then events start happening that bring owls too them: that night, their girlfriend, knowing nothing about this, sends them a funny youtube video about owls. Hmm! Finally, they notice owl-related items in their homes or at work, which they kinda hadn't noticed before, but do have a memory of having been there. They start to wonder: was it always true that I bought this stuff a while back? Or has it only become true now?

It starts to look like the exercise has updated all future experiences to incorporate owls where possible - even existing situations and their memories. You get the idea. So the simplicity of that and getting results gives an insight into how automatic and mechanical reality can be. You think there's a big world "out there" where stuff happens, but really it's just lots of patterns combining on a conscious screen that has no depth to it...

So not just "wow!" results but something which really breaks your idea of reality.

Owl & Screen Metaphor

You draw a picture of an owl on your TV screen. It is always there, but its visibility depends upon the rest of the imagery onscreen. When the dark scenes of the TV show switch to a bright white scene, suddenly the owl "appears" - it is "manifested". Now imagine an owl idea being dissolved "holographically" in the space around you, and replace the notion of dark/white scene with appropriate contexts. Having "drawn" the owl into the space, you go about your day. Mostly the owl isn't anywhere to be seen, but wherever an appropriate context arises then aspects of the owl idea shine through and are manifest: A man has an owl image on a t-shirt, the woman in the shop has massive eyes and eyebrows like feathers, a friend sends you an email about a lecture at the zoo highlighting the owl enclosure, a newspaper review of Blade Runner talks extensively about the mechanical owl in the interrogation scene, and so on.

Q1: That is so interesting. Very similar to a lot of LoA stuff really. The fact that you took out so much time to type all of that touches me deeply. I've spent some time going through your posts and seeing how beautifully deep your views are. The key comes across as one letting go of resistance to feel the full effect of these forces of the universe (don't know how else to phrase it) and I wonder if you have any opinions/advice on letting go.

Well, everything has to have the same basis, if you think about it. If there is a "how things are" then all the approaches that work must be come from the same insights, even if they have some extra layers on top which seem different!

Yeah, it's hard to phrase these things, isn't it? But if you keep it simple, all you ever have is an experience, and all you every desire is particular experiences. Intending (willing-deciding) shifts your experience, and detachment (letting-go-allowing) is what permits it to happen. On "letting go", well it's not something you can actually do. It's about something you don't do - you don't stand in the way of your current experience shifting into your desired experience. But still, how?

Think of it a little differently. Here's a couple of suggestions:

The Background Space and Not the Things

Whatever you are identified with, that's a bit of "ground of reality" that you are "standing on" and preventing it moving. So the real trick is to identify with parts of experience that don't move, so I suggest: Identify yourself with the background space in which your experience arises. Take a moment, and "feel out" into the room in all directions, and beyond. You'll find that you can actually feel out "forever". Now, imagine-decide that you are this background space, and all sensations, perceptions and thoughts are just bit of imagery floating in that space. By identifying with the background space, you are implicitly allowing the content of the space to shift more easily because you aren't "standing on it" by essentially thinking in terms of it.

Out of the Way and By Itself

If you think about something, you are essentially re-triggering or re-imagining it into your experience. This includes even the most simple things, and you can experiment with this easily. Sit down on a simple chair. Now, decide to get up but don't do anything about it. Wait until your body moves by itself. This may take a while...

Here's the trick: If you think of your body at all during this, you will re-assert it's current position. When people get up normally, they first think of their body sitting (re-triggering sitting) and then try to overcome sitting by "doing", to get to standing. Instead, either switch your attention to the background space (delocalisation from your body) or focus on your forehead (withdrawing from the rest of your body). Try again: "imagine-decide" that your body will stand up. And wait. Until it moves by itself. This is how it all works.

The Form of the Decision

So it's worth talking about what is meant by "deciding" in detail:

- A decision is the summoning of a sensory image that corresponds to the desired state.[1]
- Since your experience is an "imagination space" anyway, by doing this you are basically deforming your space into that new shape. Provided you don't get in the way, your state will naturally shift to the new configuration.

Metaphor: It's like a sheet of material which has been pulled taut and a steel ball placed on it. The ball sinks in and the sheet takes on a shape accordingly. (The position of the ball is your holding a state; the sheet is your imagination space.) How to make a change?

Well, if you push your hand down in another location, the sheet will deform and the ball will roll towards it, settling into the new position and fixing the new state of your imagination space: the desired experience. However, if you push your hand down in the new location while also pushing down at the old one, then the ball won't transfer, you won't get a change of state, and it will merely have been a temporary fantasy...

Conclusion: Imagine & Imagine-That

Anyway, those are some ideas. As you can tell, I think one the most important things is to see everything as imagined. The world around you is just something that has been thought-about for so long that it's become a stable idea and your experience pop up in alignment with that. However, you are perfectly free to imagine new things and define them just by "deciding" their properties. The two sides to this are: "imagining" (create an object) and "imagining-that" (assign properties or facts to an object). For instance, if you were to take some time to imagine a glowing sphere and you imagine-that the sphere is a super-helpful robot who scans the city for people you'd be good friends with and then brings them into your life, then you have literally created such a thing and it will behave accordingly. Where LOA maybe falls down a bit is that it's model is quite vague because it has the "imagine" aspect - with detachment/allowing - but it does have the concept of "imagine-that".

[1] In general this would be a 3D sensory image filling the space you are occupying, from a subjective point of view. For instance, if you want to be in the Galapagos Islands, you would temporarily "overwrite" your experience of this room with a shadow-sensory experience of that. However, as I mention in the final section, you can do this other ways too.

Q2: WOW!!!!!!!!!! This is some deep stuff happening here. I'm really enjoying this conversation. I'm always looking forward to seeing the orange inbox icon. I'm so happy our energies connected. I agree, there is a foundation upon which all philosophies find their footing so of course there will be that common focal point. Thanks for those excellent tips, they seem slightly similar to mindfulness in the sense that you allow the situation to simply 'be' and no clawing at what 'is'. Since I am very much at ELI5 level in this enhanced understanding of "reality", could you give an example on how to use this on, say, a somewhat tangible topic, such as relationships or money. I hope I don't come across as a silly one, but its easier at times to understand with context to a particular type of situation. Might I ask what books do you recommend. I would seriously love to get to know more about this.

Well, it's a fun topic and... useful! Everyone starts each day somewhat in ELI5 mode though; that's what a spontaneous world is all about.

Mindfulness

...they seem slightly similar to mindfulness in the sense that you allow the situation to simply 'be' and no clawing at what 'is'.

Yes, mindfulness is definitely related. Unfortunately, I think that "self-help" mindfulness is poorly presented sometimes as a shifting of attention onto different parts of the body and so on - implicitly viewing attention a bit like a "torch". In fact, attention is more like a "filter" and your aim should be to release it so that your "imagination space" is unconstrained. After that, attending to something would be viewed as the content itself "brightening and expanding" in the space, rather than you trying to contract your space down to it. (If that makes sense.)

I think that sort of thing is getting better presented now though.

Examples

Could you give an example on how to use this on, say, a somewhat tangible topic, such as relationships or money.

Well, now that you know you can treat your world as a big imagination space filled with imagined stuff, there are lots of ways. So for a good relationship, then. In both cases, just relax and release control of yourself. Do not make the imagery come and you do not even need to imagine vividly. You stay relax and just ask and let whatever sensory stuff comes up, come up as you do this. (This means you are accessing the actual situation rather than imposing thought.)

- **Indirect Fun:* Like we did before, you can imagine an amazing robot that you send out to find the best partner and bring them to you. Or perhaps imagine that just behind the scenes of the world is an infinite grid that connects everyone, like strings, and you imagine that one of the strings lights up because on the other end is your perfect person. You tug on the string and it starts reeling towards you... you know that person is coming into your life.
- **Direct Fun:** This is more like we discussed earlier. Here, you simply imagine an immersive scene in which you are with a particular person who is fantastic, fully feeling and enjoying the situation, knowing that it means you've got what you want.
- **Super-Simple:** Simply issue a command, with full power and expansion felt behind it: I will meet a perfect person and have a great time.

In each case, what matters is that you imagine-that performing the action means-that your desired thing will happen. And knowing-that it is done, you can enjoy anticipating with confidence, or leave it be, or whatever. The only thing to avoid is second-guessing or half-redoing, because then you are doing the same thing again, with a different intention.

Books

Might I ask what books do you recommend. I would seriously love to get to know more about this.

Well, this is a mix of stuff to be honest!

Neville Goddard's books are worth a read because they are a no-fuss version of using imagination and free. The only caveat is his framing device is that the Bible's parables are misinterpreted and were instructions for doing this sort of thing (he might be right) but the books only reference that a little. Summary article and this book and other materials. The couple of links I gave above - Kirby Surprise, Alan Chapman, Ramsay Dukes - are worth a read. For more, the partial reading list over at /r/Oneirosophy is worth a look. Robert Waggoner's book on lucid dreaming in that list is worth your time too. (Hmm, a lot of "worth" there; I need to get me some new words!)

But really, you should just experiment with your imaginary world and see what happens!

Just by you saying this, it shows you're the real deal.

Why thanks! Personal experimentation is always the way, and that's how you discover what works for you. It encourages you to operate through direct-experiencing rather than thinking-about. (If someone selling something suggests otherwise, run a mile.)

I have found that my issue is very much with letting go

The whole "letting go" thing is hard to grasp conceptually, definitely; it's something you understand through direct experience. If a person can't "manifest" standing up effortlessly, then they're going to struggle to understand how other changes can happen. (And think how much better daily life can be if your body is "flowing" rather than being dragged around?)

It takes a while to learn not to "do" not doing though. We tend to assume that the opposite of a clenched fist is to hold the hand open (say), but actually that's the same error in the other direction. The answer is to cease clenching and intend being open.

Seeing how brilliant your understanding is, would I be correct in saying that you can pretty much manifest stuff consistently?

The ideas I've ended up with come from a great mix of getting what I want and also completely screwing up! :-)

But I do seem to have become remarkably lucky over the years...

Actually, I was quite a tense person for a long time and didn't realise I was always getting what I wanted; I was very much about "doing" and had a habit of not noticing the opportunities. Another reason to detach: it improves awareness! :-) It can actually take courage to walk through the doors you create; having trust in yourself-as-the-world is an important development. My big lesson, certainly. What I was really always interested in was "the nature of reality", what metaphors are, and things like what the "sharing model" of the world is - kinda independent of getting results, so in a funny way this stuff was a sort of side-show. Finding fun worldviews that people can use ("active metaphors"), and researching "discontinuities", is what I'm about at the moment. The stuff about "doing" reminds me of this great essay which you might find interesting.

POST: I Did Not Climb The Ladder. (/r/lawofattraction/)

As another commenter said, the purpose of the exercise is to show you that if you summon an image into your mind and an act, it will be reflected in your life subsequently. When you say "I will not climb the ladder" that implies the image of a ladder, the existence of a ladder in your future - triggering of a "ladder scenario" into experience without you challenging it - which you then don't climb. It's a clever way of preventing you questioning whether the ladder scenario itself will appear - because your focus is on the climbing-or-not. Creation by implication!

Next up: "I will not be frightened of the escapee lions..."

Aside: Before NLP became pop-psychology, in the 1970s Bandler & Grinder did a lot of work on modelling language and experience. See the Milton Model in Patterns of the Hypnotic Techniques of Milton H. Erickson and later on the Meta Model in The Structure of Magic Vol I. These are very much about using language to imply something so that it's not questioned by the conscious mind.

Before I discovered LOA I thought I was haunted by owls...

You'd be surprised at how many people's lives are rather, um, "owl-rich" these days! ;-)

Ah, The Owls Of Eternity™

Regardless of everything, you should do a daily "playing dead" exercise for ten minutes:

- **Daily Releasing Exercise** - Every day spend ten minutes lying down on the floor and "playing dead", giving up control, surrendering completely to gravity, releasing your mind and body and especially attentional focus, letting them move however they want - to get used to what detaching is like. (It feels nice to do this anyway. Nothing to achieve, no aim other than allowing things to shift about as they please. The most relaxing thing you can ever do.)

Then maybe read Imagination Creates Reality to give you an idea of the general idea. You might like to read about The Infinite Grid of All Possible Moments and adopt that as your background metaphor for how you can shift from one experience to another, just to give you a feeling that everything is possible. Then you're going to choose a scene that means that your ex is back in your life. You are going to avoid incorporating into that scene any path for how and why this happens. The idea is that by doing this you are literally inserting a scene into your world - just like inserting a frame into a movie-reel so that it will later be projected onto the screen. You don't need to worry about how the frame appears in the movie; the projection system is automatic and takes care of itself.

Get all relaxed somewhere and:

Suggested Scene - You are in a coffee shop, relaxing on a stool with a warm drink in your hand, your [name of person] is beside you and you are beaming with happiness. You are talking about how great it is to be back in each other's lives. The scene is like a fully-immersive 3D multi-sensory thought. You don't need to "draw" it, you simply let it fill out naturally and let all the details come to you. Just by looking for a good scene it will appear in your mind.

You might want to read about The Imagination Room to give you some inspiration.

Owls - I often use them as an example when encouraging people to try and cause synchronicity, there's no meaning other than that. Looking it up now, I see they are traditionally associated with intuition and transition, which is good eh? Of course, your experiences of owls may be because I am using them as synchronistic patterns. ;-)

(I used to use other things, but I read a thought experiment using an owl and figured they are the perfect balance between not being super-strange, but still unusual.)

On the right track - Hmm. Being "on the right track" assumes there is some external path to follow, perhaps? Maybe best to just focus on what you actually want to experience, rather than attempting to create "signs" for yourself which you then reinterpret, because that's just adding another layer that you don't really need.

"I will not gain £100 unexpected income"

I feel that this probably won't work, at least not in such a basic form, although it depends on the actual detail you are ending up imagining. To expand:

- When you say "I will not climb the ladder" the focus is on the "not-climbing" and the ladder is created by implication. The phrase presupposes an encounter with a ladder. So you get a ladder but you don't get the climbing. The negative did not actually generate a positive in this example.
- You actually got exactly what you asked for: the experience of "not climbing a ladder".
- When you say "I will not gain £100 unexpected income" then the focus is on the "not getting" of £100, but you are not necessarily implying that an unexpected income will come into existence. The phrase doesn't presuppose an unexpected income in the way the previous phrase presupposes a ladder.
- If the first phrase had been "I will not encounter a ladder", you just wouldn't have encountered a ladder.

However, having said that, your actual intention matters here - the "feeling-knowing-meaning" attached to the affirmation. In other words, if you are saying the phrase with the definite intention that it means you will get £100, then that intention dictates the form of the pattern you are triggering. The implicit declaration that "doing this means that will happen" is the what will actually shape the form of the resulting pattern.

Q1: It's not manifesting it directly, it's more about manifesting the opportunity. I was presented with the opportunity, and I recognised it for what it was, I just chose not to. I could have easily climbed the ladder as much as I didn't. With that logic, I'd be presented with the opportunity, but I would take it this time. LoA is about manifesting opportunities, if you extrapolate the thinking. You're opening paths of least resistance, each path is taken to get to the desire, but the genesis of the path is generally an opportunity.

Well, you'll have to experiment for yourself of course and see how it is for you - but this stuff (in my experience) works in a far more basic and literal manner than that. Very like hypnosis, like you are hypnotising the world. (If you delve into that Milton Erickson book, you'll see what I mean.)

It's all about what appears in your mind when you say the statement or make the decision. You get exactly what appears in your mind. If you simply make a statement, it will become true in a no-frills way. If you create a mental scene, exactly that scene will appear in some form. It's basically kinda stupid. Like you are literally drawing patterns onto the world and then encountering them later. And that's why it's good to let go of it once you've made the statement - because you tinker with the idea or rethink it, you end up overwriting it with the new thought. On the ladder thing, then, you might ponder:

- Did you really choose to not climb the ladder? Did you do the deciding?
- Or did you "have the experience of deciding not to" - thereby exactly fulfilling the actual request you made, which was to have the experience "not climb a ladder". And just post-rationalised it.

One thing that comes up in hypnosis is that the subject comes up with all sorts of reasons and excuses about how they could have opted to disobey the instruction, but they chose to follow the instruction anyway. Random snippet from elsewhere:

"Yet another similarity between dreaming and hypnosis is the odd phenomenon known as ‘trance logic’. This has long been recognised as an important characteristic of the hypnotic state. It is typically defined as “an extreme tendency of subjects to rationalise any occurrence they experience, no matter how improbable or absurd it may be”. In one example a subject in trance, who was told to close the window in a room that was uncomfortably warm, did so whilst explaining that the room was cold and draughty."

That's why it's (maybe) better to think of the LOA as being an indirect request to have a particular experience. When you intend to lift your arm and your arm moves, that is an indirect request to "have the experience of lifting your arm". You do not "do" the arm movement; you experience it. This stuff is the maximised, generalised version of that very same idea. And that's why you have to be careful what you wish for - and if you change your mind, do it ahead of time because once the experience arises, it'll follow through by itself as it happens to you.

On the books, if I were you as regards Goddard I'd browse Imagination Creates Reality and then The Pruning Shears of Revision and be done with it. That gives you what you need.

On the climbing or not climbing thing, you can get yourself in an awful tangle with that sort of self-guessing! :-) You might right now be able to imagine that different things could have happened, but only one thing did happen.

As I say, the actual thing that was in mind produces the final experience when you "get there". So, if there is was a little box named "Thursday" then you could keep editing the thought-content of that box right up until that moment arrived, at which point whatever thought was in that box would become your 3D-immersive experience and would happen to you. Unless you specifically asserted the new fact of "I will climb the ladder" then it wouldn't happen. Different people respond to negation in different ways. The appearance of the ladder was certain, the climbing-or-not would depend on (for example) which of these two images you'd generate to represent that idea:

- "Not climbing a ladder" = An image from the perspective of the bottom of the ladder, looking up and not moving.
- "Not climbing a ladder" = An image from the perspective of climbing up a ladder, with a red cross over the image and the word "no".

You can probably guess what the result of each of those would be. (Hint: in the second example you might find yourself climbing up a ladder which has some red paint on the steps, round at your ex's house, while she's telling you she won't help you carry the boxes down from the attic.)

Anyway, so I think you are right to say you don't have choices as such. You don't operate directly. What you do is, you edit the facts-of-the-world with your thinking - and encounter those facts as an experience when your "world-thought" gets to that location. Don't think of "the universe" bringing things your way. Just think of it as directly editing the facts of the world - "this fact is true", "this will happen", and so on - and from that point all your observations of the world being consistent with those updated facts. Yeah, it's great to have stimulating conversations about this stuff!

TriumphantGeorge Compendium - Part 32

POST: I wrote this article which through logical reasoning explains WHY Law of Attraction works (what do you think?) (/r/lawofattraction/)

A good read!

One thing sticks out - that it assumes that our accumulation of "previous observations" persists. Just the use of the "path metaphor" implies that obviously. Makes me think - Is there room in your description for events which arise counter to previous observations? Isn't the "narrowing fan" of possibilities a function of the metaphor, rather than reality? Is "plausibility" an attribute of the world, or is it a condition of the mind?

If we can imagine anything, and what we can imagine can become experience, then what is it that limits our ability to "step into" what we have conceived of and can it be overcome?

Q1: Thanks - glad you liked it and thank for you interesting questions. Well that is true - previous observations (or impact on you by your context) do persist, but it also fades over time. Just as your overall impact on the world fades over time. So those with a big impact on the world (like Leonardo Da Vince) has not faded completely yet although his impact is fading (slowly over time. The same effect goes for your "previous obsrevations" impact on you. The most significant stay longer than the less significant. I am not quite sure what you me by "counter to"? Can you elaborate with an example? The "narrowing fan" of possibilities/choices/opportunities is only something that we experience in the mind, when we THINK that we have less opportunities, however, we almost always have an infinite number of opportunities. So "plausibility" (if you mean the chances for something to happen?) becomes a condition of the mind. When you realise that you can conceive it and you have an infinite number of choices/opportunities there will also be an infinite number of ways to get there. Some things are just "further away" than others on a time scale. When we dream big things are often further away in the future, but that does however not mean that there is a lesser "chance" for you to reach your dream. In terms of your last question I think that this is often a mix of "fear of failure" and conditioning of the mind from our context (i.e. society telling you that: "you can't have everything in life", "the trees don't grow into heaven" and "making money is hard work"). We have heard these "sayings" so many times that it takes effort and time to get truly rid of them and before we shed these limiting beliefs we hesitate to "step into" what we have conceived.

Okay, let's have a go at being clearer...

In terms of "counter to", what I'm playing with is the notion that our previous observations suggest to us what is plausible for future observations, and that this is what limits us - limits what we will make happen - rather than the world itself. (I'm using the word "observations" here to try and keep things as general as possible: both external events, passing thoughts and deliberate imaginings would all be "observations".)

What is plausible to us limits the set of experiences that we will allow ourselves to have - in terms of what we will choose to intend, and also in terms of what we will let happen. So if I wanted to lose weight, I wouldn't intend to lose it in one week, and nor would I allow that to happen, because I "know" it doesn't. But more interestingly: if my brother had always hated alcohol and was allergic to it, I wouldn't intend or allow myself experiencing him showing up at my yacht party sharing out the champagne. Also, I wouldn't intend or allow his eyes to suddenly change from brown to green. These things (his allergy, his eye colour) have become "facts" to me, even though those "facts" only belong to my thoughts and conclusions from observations, not to the world itself. So "plausibility" and the "narrowing fan" arise from what amounts to self-imposed limits for future experiences. We can't ever know what the limits of the world are (if indeed there are any), all we ever know is our personal limits which we've essentially made up. When such things do happen, we call them "coincidences" or "glitches" or "miracles", depending on the extent that they break our previous ideas about the world. This means that even the idea that we are on a path is a limiting notion, that the world unfolds by a sequence of choices in a probability space, and that things can be "far away". The path concept is itself a conditioning of society and our own thinking. Now, that's not to say that anything can happen - but it does say that prior observations are no indication of what could happen. Prior observations are evidence of our own state of mind, rather than the state of the world.

Q1: Hmm.. very interesting point (I see what you mean now). I like how you question the underlying notion of the article. So, are you arguing that the way of looking at life as a series of choices is in fact wrong? I think that this (path notion) is a product of the time moving forward. In terms of not "intending" to lose weight or changing your brothers eye colour: Isn't this why we should always visualise all our goals as already achieved and feel gratitude towards that we have already achieved it? Doing this would leave out the "in a week part" which of course wont happen. The "facts" (learned from our observations) such as your brothers eye colour or how fast it is possible to lose weight is a product of your context. Some of this has already been formed (in your DNA or similar) and the time in point in which this was a possibility has thus already passed which is why it cannot be "changed back". Same thing goes for people with disability, my height etc. It was a choice and possibility at an earlier point in time, on path was chosen and because time moves forward it is not possible to go back and choose another path.

I think that the notion of a life as a series of choices is not necessarily wrong, but may be optional. I think this view arises from a particular notion of time as something that passes, something that happens to us, rather than (say) something we do. Perhaps instead time doesn't move forward through us; rather, we move our attention across a landscape of experiences. It's the difference between the "stream of consciousness" model and the "associative traversal" model of experience. And associative traversal operates by logical connection rather than causal sequencing. This is how we can think ourselves into the next moment. When it comes to intending by visualising as "already achieved", what we are really doing is leaving the timescale up to our accumulated observational debris. We are deliberately omitting detail in our intention such that this aspect "autocompletes". We are deliberately choosing not to challenge prior observations, and this is why accumulated "implied facts" persist and limit us. Although we are doomed now to get into philosophy if we go to far on the next bit, it's inherent with the LOA that we are living in a somewhat "private view" of the world. The more you push it, the more obvious this becomes. What it eventually amounts to is:

- The only thing that is definitely true is that your experience arises as senses, perceptions, thoughts.

There is nothing solid behind it that you will ever experience or encounter - e.g. "sequencing your DNA" is just another thing you can experience, it doesn't cause anything as such. It itself is another result. If you ask for (admittedly this is an extreme example but let's go with it) a change in your brother's eye colour, you are not really asking for DNA to change and history the be reformed. What you are asking for is: that from this point onwards you will have experiences (senses, perceptions, thoughts) that are consistent with your brother having green eyes. All requests are really of this form. What you are calling "context" would correspond to my idea of accumulated observations. But whereas (as I understand it) you view context as a fixed foundation that is added to (like sedimentary layers, or a journey along a one-way path), something which has a level of "solidity" - a collection of observations has no such solidity. It can be revised or overcome because previous observations are not "buried" by later ones. I think of this as a collection of superimposed patterns - like moire fringes. The current - apparently moving - experience is a summation of all contributing patterns, equivalent to all previous observations. Meanwhile, LOA intention and indeed everyday choices correspond to the inclusion/activation of an additional pattern. However, we can see that all prior patterns are still accessible. Meaning we can perhaps do more than simply add - we can revise or remove.

Q1: Very interesting! I definitely have to look into te associative traversal model. In saying the the "solid" notion of our center as something fixed is an optinal viewpoint of the "collective observations" you implying that the latter is closer to "the truth"? I see where you are getting at - a very platonic view of the world where the only true thing that we can in fact know is the input from our surroundings through our senses. We only see the "shadows on the wall" and not the world it self? I am very interested in hearing how you interpret/explain LOA from your model? And also: is the any limitations imposed upon us by our observations (since everything is only what we perceive)?

Yeah, it's a view I'm pretty keen on at the moment. Eventually it involves flipping round the orientation of experience, but it's much more truthful to actual experience and it leads to some useful approaches I think.

To continue...

Well, associative traversal is just a way of saying you "recall into existence" your experiences - as if there was a vast memory-block of all possibilities and you "think your way through it". It changes the perspective view from that of an external world, to one of an activity of mind. (Which of course makes sense for LOA.)

It's slightly Platonic but we have to be careful what we mean by "the world" now. In this conception, the world is not a "spatially-extended place unfolding in time". Instead of being a shared environment it is more like a shared resource of possible patterns which we can draw upon for our personal experiencing. Rather than being a body and walking around in a world, what's happening is that we are a conscious perspective which is having a being-a-person-in-a-world experience. Observations of the world are no more inherently restrictive and limiting for subsequent experiences than, say, a sequence of thought limits what you are able to think in the future. In fact, I'm going to make a suggestion here: the only difference between a world-experience (sensory) and a thought (shadow-sensory) is that the former is 3D-immersive and stable, whereas the latter is not. This leads us to a useful formulation:

- The world is just a line of thought, albeit a bright and stable and immersive one.
- The world has no depth.
- Dissolved into the background space are all possible forms and relationships. It’s like a toy box filled with pre-made shapes and layouts, objects and containers.
- To bring them into worldly existence, we merely have to recall them.
- To recall them is to superimpose those patterns upon current experience. They are incorporated and “manifest” wherever context permits.
- The more specific we are with our recall, the more narrowly defined the context. (For instance, we might incorporate a timeframe or location or circumstance, and manifestation would be constrained appropriately.)
- An ‘intention’ is simply the name for a pattern which we want to see incorporated into our life. The thought of the intention is that pattern and is its activation.
- We "recall things into existence", in effect.

So we might take this and use extreme examples to ponder it...

Okay, let's assume you are experiencing being sat in a room looking at a screen right now, reading this. Take a moment to recognise something important: although you tend to assume that you are a body in a situation, your direct experience is more like you are a "perceptual space" in which your experience of vision, sound, texture arises. If you are this space then the room around you is like a three-dimensional thought or imagining that you are "filled up" with. Now, I want you to think about the room next door. For the sake of the example, let's assume this appears as a small mental image floating in front of you. Ask yourself:

- What's the difference between being in this room and being in the next room? In what sense is the next room actually "next door", if at all?
- If the thought of the other room were to become brighter, more stable, and "fill up" your perceptual space, surrounding and enveloping the region where your body sensations are, then how (if at all) would this differ from actually being there?
- If the next-door-thought persisted, would that mean you had teleported? Instant manifestation of "being next door"?
- Why exactly do we tend to have an experience of "walking from this room to the next room" rather than simply teleporting? Why do we have a passage-of-time experience before our desires manifest?

So hopefully the relationship to LOA type stuff is clear.

Q1: Its clear thanks, but I clearly do not have as in depth an understanding of this as you do (and its implications). How did you learn about this viewpoint, what is your profession and would you be interested in discussing it more on Skype?

It just developed over time - via philosophical musings plus direct experimentation. Don't let my take on things distract you though: all descriptions should be viewed as "active metaphors". They shape experience, sure, but experiential content itself should be seen as arbitrary. So find ones that appeal and use them. You've already got an interesting worldview going on; I wouldn't want to derail it. Having said that, you might find some posts elsewhere worth a look, even though they are framed in terms of a particular perspective. Check out the top posts and wiki for related reading.

POST: My Problem And Questions About LoA (/r/lawofattraction/)

Some random passing thoughts:

Intention and Direction

You could put all the work in and never get better at golf or stand-up - if you didn't actually have the intention to get better. And that intention is basically a thought, a thought of being good at it, with that thought one day appearing as a stable experience. "Undirected" work does nothing unless it arises as part of such an intention-thought; and any work we do which doesn't arise from that, is just busy-ness. You'd be better thinking of it as LOA (or whatever) increasing the contribution of that particular pattern into your life. It works in a "dumb" way. Your body and thoughts and the environment are all part of "the world", and movements in "the world" result from intention-thought. Whatever you imagine, the world (or rather your experience of the world) shifts in that direction. There's no intelligence behind it.

Arms and End-States

For example, if you pay attention to how you deliberately lift your arm, you'll find you do it by a feeling-thought. If you type a comment, you do similarly. In all cases, you intend the end state and allow the world to flow towards it. You don't (hopefully, although people do tend to try) control the intermediate states. So, LOA is simply the same deal: specifying end-states (via imagination directly or indirectly) and allowing the world to shift towards them (hence detachment and letting go). The key insight is that there's no difference between the event of your arm moving and other apparently separate events. Given that you have to specify the end-state, that should give you an idea of its limits. You can't specify creative discovery in advance, for instance; that can only take place as part of the shift. So, you could specify a state where everyone congratulates you for an amazing round of gold, and then allow your play to arise spontaneously from then on, but you can't specify the actual route in advance. That's what practice becomes about: getting better at defining end-states (the hole, say) and detaching and allowing the world to shift to it by creative exploration (finding the natural path of your swing), and establishing efficient routes. The more you try to consciously control that part ("work it out"), or if you aren't focused on the end state, the harder that is.

Literal Change of State

A thought experiment: Sitting in the room you are in now, look around. Recognise this as being like a 3D-immersive multi-sensory thought which you have taken on the shape of. Now imagine that this room and your body fade away and are replaced by another scene, on a lovely island, and your body is feeling particularly healthy. You become that new experience instead. If there were no other patterns in your world, no structure, then that would be that: you would now literally be on that island, feeling great. However, you have accumulated all sorts of structural habits, not least the belief in an external world where things "happen" before they get to you. So instead of your experience shifting directly to this island end-state, it unfolds towards it in time, which will have been your implicit intention anyway. You will have plausible-seeming intermediate experiences about how you "get there" (although some of them may still be rather miraculous). Which leads to a problem: because there is a time gap, there's lots of time for you to imagine other things that are counter to that end-state, and derail it. We start to believe that it won't happen and believe other things that are arising in our experience, and so on. We deviate from thinking that it is a dumb, mechanical process that must be persisted in and maintained, or at least not countered.

To wrap up, we might suggest:

- **There is no difference between experiencing something in the senses and experiencing something in thought ("shadow-senses"), apart from the intensity.** They are both observations of fact as far as "the world" is concerned, and vary only in their level of contribution.

(You may or may not find the post The Patterning of Experience and its links useful.)

Q: Thank you for taking so much time out of your day to write that. I must say it seems as if you are a VERY smart person. I enjoyed every comment you made and read through them thoroughly. A quick question on "the end state." I love your example of an arm, but is that translatable into other assets of life. So for example if my end state for my comedy career would be selling out a 10,000 seat arena is that what I should be thinking about as my end state?

Very kind words - it's all a trick of formatting, I'm sure! Well, it gets all this stuff out of my head at least. :-)

Yes, the arm is translatable. One way to think about this is that you never "do" anything, all that happens is you "insert experiences into your future", allow your world to unfold, and later on they appear in your sensory world. Allow me to ramble on this theme...

Timeline Thinking with Movie Frames

A useful approach is to think of a "timeline" consisting of individual "movie-frames" of experience, individual moments: Imagine the timeline runs from behind you (the past) to directly in front of you (the present) and beyond (the future). As time passes, a new "frame" becomes the present moment, it expands into a full 3D experience that surrounds you, falls behind you into the past, and then the next frame hits, and so on. The important thing is that all the future and past frames are present right now; it's just that you can't see them because they are obscured by the closeness and brightness of the current moment. Currently, the frames ahead of you are filled in according the implications of your previous experiences and thoughts.

So, how does the "end state" approach apply here? Well, there are three general ways that your intention-imagination could operate on your future frames. I'm going to stick to my favourite example of "owls". You want to see more owls, how can you go about it?

1. You imagine an owl as vividly as you can. If you do this, then the pattern "seeing an owl" is applied over all future frames, and owls will appear whenever there is an appropriate context for them. You will find yourself glancing in a direction at the very moment an owl image there, etc.
2. You imagine an owl in a particular situation. If you do this, then you will experience a more specific event, slotted into a particular moment. You will find yourself being led through circumstances which lead you to that particular situation containing an owl. (=a "fixed frame" that can appear in any moment)
3. You imagine an owl at a very specific time and place. Here, you have completely specified the frame in which the owl will appear. Again, the rest of the frames will be automatically adjusted accordingly. (=a "fixed frame" that is located at a particular moment)

In each case, doing the imaginative exercise immediately redefines the future. In other words, just as with your arm motion, where you insert a frame of your arm being in a new position, you assert an end-state and then surrender and have "faith" - to let your world unfold towards it without interference.

Applications to Comedy Gold

So, hopefully this suggests a strategy for Superior Comedy Achievement. Obviously in stand-up we don't want to control our act, we want to to come over spontaneous and we want to adjust and react to the audience.. We want creative discovery to occur, so no matter what, we probably don't want to create a fixed frame in depicting the gig itself.

General Gig Improvement - We do want to define the overall outcome, though: a successful gig, or at least a valuable gig which improves our act. So you want to come up with a state which represents that - and then completely let go during the gig itself, allowing the performance to "happen" to you. One suggestion could be just fully create a "frame" where you are at the bar afterwards, feeling great about the gig and what you've learned from it, having people come up and say "thanks man, that was great, really original", and so on. Do this enough in advance, and then in the interim period allow synchronicity to help you write the material, following whatever intuitive clues and thoughts appear, even if they seem logically unlikely. (A friend asks to you help look after his brother's owls for the weekend while he's away, man how tedious, but I feel the tug of intuition, could it be owl-based comedy FTW? I'll go! etc)

Hitting the Big Time - Any scene at the start or end of a gig, look out over a massive audience while thinking "this is it!", or perhaps seeing yourself listed in an advert for a particular venue that would mean achievement to you or - any other particular "fixed frame" of experience that would mean to you that you had already succeeded.

Book Recommendation

Since you're doing physical and performance-related things, I'm gonna recommend my favourite book on such things. Although it seems to be another book on the Alexander Technique (bodywork for actors and musicians), the author in fact experimented a little and pushed into "this stuff" without realising. It covers her discovery of what I call "Just Deciding" in a very accessible way.

Q: Thank you again. You have managed to bring more questions to me, but in a very positive way. You have made me believe in LoA much more than I did before I wrote this post. To the question: it seems a lot like LoA is focused on the future a lot. I am a firm believer, after reading The Power Of Now, in being grounded in the present moment. Can you still be grounded in the present moment but continue to create "frames" to help you manifest positive things in the future? Also, are you/have you tried stand up comedy? Your comment on it blew me away and I only think somebody who is experienced in that craft could have presented so elegantly.

Yes, you can always stay grounded in the present moment. Being in the "now" isn't about only seeing what is around you in the senses (passing thoughts are just as much a part of "now" as anything else, just lower intensity) ; it's about deliberate action in the now and not being distracted. So, all your "frames" past and future are actually present now. It is just that the content of "now" shifts - i.e. which frame is "brightest" changes. Inserting or updating a frame is an action now on frame which exists now - it's just that it's current contribution to your sensory experience is relatively small. I think of it as a "world-pattern" - a static shape containing all the facts and experiences (all timeline frames) of your private copy of the world. The pattern is always here, now; one part is brighter; all of the facts and frames are available for update.

- Short answer: The Power of Now is more about not drifting into unproductive thought and worry, rather than avoiding accessing past and future deliberately.
- On the stand-up front: I've always been a big fan, and done some writing, but never partaken! One of the most under-appreciated arts I think, although it's getting more respect lately. I've done a lot of work on investigating acting, performance, spontaneity, movement, etc - so that's contributed to my take on things.

Q: I've always been a big fan, and done some writing, but never partaken! One of the most under-appreciated arts I think, although it's getting more respect lately. I've done a lot of work on investigating acting, performance, spontaneity, movement, etc - so that's contributed to my take on things. You should definitely try it if you have any ambitions to do it. Thanks again for your time. You've shined light on a lot of topics I have not considered and answered a lot of my question in such a delightful and educational way.

Well, I've recently returned to screenwriting so who knows - I might get into Performance Mode again!

No problem! Always a pleasure to chat; glad it was of use to you.

POST: Editing your personal narrative leads to happiness and success (/r/lawofattraction/)

Q: [https://www.youtube.com/watch?v=ioiYwpsL44M] I don't really know who this guy is, other than he rights comic books. But this is a video of him telling how he would write a story and the events would be reflected in his day to day life.

Grant Morrison, graphic novelist (he wrote The Invisibles) and self-proclaimed magician (he wrote The Invisibles as a "hypersigil"). He was a big proponent of chaos magick and the use of sigils (see a primer here). Sort of LOA x 10. Possible idea: The background "format" of your mind (current patterns you've absorbed) seems dictate what you perceive in the world around you (both thoughts which arise and external events which appear). Engaging in creative endeavours tends to alter that format particularly. Whatever the mechanism of that is, is hard to say. Probably it's about meaning and symbolism; the dream-like nature of everyday life. His story reminds me a bit of Philip K Dick's essay How to Build a Universe....

I think of magic as using your intent to change reality. To me, that's the same as consciously using the law of attraction.

Right. And the same as moving your arm! It's the same mechanism underlying it all, from the mundane to the magnificent.

POST: A counterintuitive loa strategy (/r/lawofattraction/)

You're basically interrogating all the bad scenarios and exhausting them, dissipating their influence - which then let's you be okay with them (because they have no emotional hit). You could just decide to be okay with everything anyway (which really means "do not react to those thoughts" and thereby re-think and strengthen them) and it would have the same effect. If you think of your thoughts and imagination as a direct revealing of interaction with the world, then this makes sense:

- **[The World-Pattern]** There are a million different possibilities that could happen, all at different "intensities" and hence levels of contribution.
- **[LOA]** By imagining one of them and responding to that imagining, what you are doing is strengthening that one = increased contribution.
- **[Being Okay]** If random bad thoughts appear and you just let them pass, that's equivalent to just letting them rise and then dissolve = no contribution.
- **[Messing Up]** If random bad thoughts appear and you react to them, that's equivalent to re-thinking them and strengthening them = increased contribution.
- **[Unmessing Up]** If you actively seek out the bad thoughts and sit with them until your reaction is passive = no contribution.

So in this view: Every experience you have (a sensory experience or a shadow-sensory thought) contributes to your future experience. Passing thoughts are just fluctuations showing you the current level of a contribution. Things that have "happened" contribute most of all (since they are "bright"), then strong imagination, then reactions to thoughts. Your new strategy:

- Strongly imagine your desired outcome, react to that imagining = increased contribution.
- See passing thoughts as just fluctuations, don't react to them = unaffected contribution.
- Persistent worries, sit with them until they become empty of emotion = nullified contribution.

POST: How to manifest easily (/r/lawofattraction/)

I agree it's all about the intention. Actually, it doesn't matter what exact act you perform except for it's ability to help specify things in more detail - e.g. shouting a command "I will win a prize", imagining holding a particular prize, or physically pouring water from a glass labeled "loser" to one labeled "winner". What matters is:

- You make the decision that "doing this act means that this fact is true".
- You view this as a direct interaction with the world; you are updating the world instantly.

Re-performing the act is fine so long as we don't implicitly reset the fact when you do it. For instance, if we worded the fact as "my new car is coming" then every time we do the act, we are making the car return to the state of "being in progress". But we shouldn't use that wording anyway.

POST: If more than one person visualizes the same thing will it manifest faster,better,stronger? (/r/lawofattraction/)

What if you visualised your friend talking about doing visualisation about the perfect night? In other words, if you used LOA to get your friend to visualise the perfect night, would that help the perfect night happen?

Wouldn't that just be pretending that someone else was doing something, when really it was your own intention doing it?

This get into the whole "how is the world shared? issue. Really, the only perspective you can access is your own "private view". Everything else is just you imagining things. If you feel that having the experience of other people apparently visualise will help, then go for it. But it's just another experience like any other. If you stick with the idea that you have power over your own experience, you won't go too far wrong.

POST: Premonition, or LOA? (/r/lawofattraction/)

What matters here, surely, **is intention**. If a thought simply appears unbidden, I'd be inclined to say it arises from your current state (world-pattern) and is a part of that state. You might call this thought precognitive if it depicts a "future" event, but the coming of that event is more like your 3D-attentional focus eventually getting to to that part of the pattern, rather than it coming to pass. In other words, it is already true now that this happens then. Meanwhile, if a thought is intentional, then that is a deliberate change of state. It becomes true, from that moment of change, that the thought-of event will happen then, and eventually your 3D-attentional focus will reach it and you will have that experience. (Your intrusive thoughts are not intentional; they are informational about the world or your personhood.)

So -

- Passing thoughts just show you the current state of the world as it is; these thoughts can be about events.
- **Intentional or deliberate thoughts are the only ones that cause a change of state**; so choose them wisely.

TL;DR: You don't need to worry about spontaneous thoughts "causing" anything. You might choose to take action or create intentional thoughts as a result of the information they provide, however.

POST: What I've learned since becoming aware that I create my reality (/r/lawofattraction/)

I wrestled with a perception that I later learned was solipsism. I felt trapped in a bubble of personal reality that people had the freedom to come into from outside of my awareness, and then leave.

Fascinating post! And that was an interesting statement. I know that it's pretty common to wrestle with identity when we realise that (apparently) mental patterns -> physical patterns. Question:

Do you still view yourself as a "person"?

Alternatively, do you instead view yourself as a "conscious space" in which experiences arise, including those of "other people" and of "you-as-person"? What do you feel to be true? Are you a person in a world, or are you consciousness having a being-a-world-from-the-perspective-of-a-person experience?

It's that thing of: how to confront the fact that your intentions seems to affect everything around you, including other people, while not descending into personal solipsism. "Co-creation" is one route, but it can seem more like a comforter that explains away the issue, so we don't have to deal with it, rather than something that is actually experienced.

...

Ah, you can't beat a bit of xkcd! Nice. I agree with the general thrust of what you say. I think (ahem) that having a thought about the structure of experience tends to impose that structure upon it - e.g. solipsism, personhood, co-creation even - and when you let go of it, you find "it's not like that". The truth of the matter is literally unthinkable, because thinking about something requires things to be divided into parts and related in space and time, but the nature of things is "before" division and space and time. As you say: "we are one, but not at the same time" (or in the same space). I'd suggest that the way in which we "create" is not in the sense of making something from nothing. Rather, all possible patterns exist already, and we "activate" them and thereby bring them into awareness. It's like exploring a "memory block" that already contains all possible experiences. Creation is already done; we are just exploring it, traversing it by triggering associative connections. This of course makes it more obvious that the way in which we share the world isn't as a common time and space - we are not in the same "place" - but rather as shared resource of possible patterns. We are all generating our experiences from the same toy box, thereby assembling our own copy of the world. I agree with the "keep it simple" attitude. You know it by doing it, really. You have to

switch from thinking about it to thinking from it. However, I do think having a basic model of some sort can help avoid getting bogged down with certain questions, particularly when it involves how exactly you should go about creation, and how to handle changes which involve other people. It gives you a low-level "logic" to follow which I think can be very helpful - and that logic can itself become a stable pattern which is "overlaid" upon experiencing. In the end though, if we are not living as this, then such things are pointless.

Q: *I'm here expressing in, as, or through this body, but the expansion of self has no limits. Creative potential is unlimited. Happy to hear that as I also thought of it as the same. Thanks. :)*

Although it's good to have our own interpretations, just for future reference, explainxkcd is worth a look. (Oh: and did you actually click and drag on the larger panel?)

POST: non-spiritual, practical LOA (/r/lawofattraction/)

It depends on what you are willing to allow in, right?

By which I mean, you are not going to be able to produce a practical description of synchronicity/LOA while sticking to a "we are bodies walking about in a spatially-extended place unfolding in time" description of the world. You'll have to adopt some sort of view where perception - or "selection of experiences" - is entangled with intention. All those people who believe in gurus and Atlantis and guides and all that - many of them have experiences which correspond to those beliefs. Meanwhile, you have experiences corresponding to whatever worldview you are entertaining at the time - but because it's how you think the world works anyway, it doesn't stick out. So, since all worldviews are to some extent fictitious and self-reenforcing, perhaps the best approach is actually a more abstract view:

- Our experiences are patterned by the metaphors we adopt.
- Our intentions are funnelled through those metaphors.

Meaning we must view the process from a subjective point of view; any "objective" conceptual framework we use is simply a "useful connective fiction" to link our intentions and observations. It is not "how it works really". Whatever so-called practical view you come to favour, it is just as much a myth as Atlantis or the Norse gods.

POST: PART 2 - Stay on Target (/r/lawofattraction/)

So anytime I feel off, I try to remind myself to stay on target. And let go and be relaxed and keep myself in good reception.

I think you are already coming up with the best advice by yourself, frankly: whenever you notice you've drifted, you bring yourself back on target. You're already doing the right thing. I suggest: just stay with that. Don't get too distracted with what everyone says (well meaning though it is). We've all got different interpretations of these things, different ways of talking about it and practicing it. But if you keep bringing yourself back to your centre, the lower breathe, whatever works best for you, and operate from there, things will get better, and you can worry about all these concepts and bits of advice later.

TL;DR: If the Empire strikes back, take a deep breath and return to the Jedi.

POST: Anyone want to share their actual process for attracting a person (specific or not)? (/r/lawofattraction/)

HelloBloodTooth: This is kinda quarky...but true- I took a pic from a magazine my Mom had found on a plane trip, she thought I'd find the advertisement for a Mens line of cloths cool and fun to shop for...I based my attraction list off the appearance of the models sporting the shirts I'm looking for...funny. Well..they all seem to nice lookn, so no judgment. Lol. I put the magazine page on my refrigerator door.

Plot twist - /u/HelloBloodTooth is now happily married to a refrigerator door repair specialist who makes all their fashion choices based on in-flight magazine advertising.

POST: What does this mean?! (/r/lawofattraction/)

I think it's much more basic than that: it's just a partial fragment of the pattern you focused on. You wrote a letter with aspects of "him, team, romantic and artistic" - and they are now appearing as "overlaid" over your experience. Out of curiosity: when you 'became" the reality, did you view it from your first person perspective (through your own eyes), or did you see a picture of the two of you? Something to consider. In any case, it's a sign that what you did, did work in some way. See how it plays out. Don't try and interpret things as "signs", you'll just get stuck in a loop where on the one hand you are asserting your desire, and on the other hand second-guessing it. Meanwhile, I'd be wary of the whole "universe has lessons" type deal. I tend to think of it as far more straightforward and mechanical: we end up creating a path for ourselves, and that continues until we make a change, by using intention to set a target, or until we are changed (by ourselves or by circumstances). There's no "benevolent intelligence" behind it as such, although it can seem that way because we are the intelligence. However, it's worth checking whether you really actually want to get back with this person, or whether want you really want is a relationship with a particular set of characteristics with a better guy. If this is what you want though, then I'd say: persist in imagining doing those things together, as if it were happening right at that moment.

Why would "imagining doing those things together" work?

Because that's how all of this works. You are basically triggering certain patterns into prominence, and those become "overlaid" over your subsequent experience. There is no "universe out there" doing stuff for you; it's much simpler than that. Your ongoing experience is like an "imagination space". This is easy to test. My go-to example with owls:

The Owls Of Eternity™

In this example, we really want to experience more owls in our life, apparently without regard to the constraints of time and space and causality. First, imagine that the world you see around you is a programme being shown on a TV screen. So we want to see more own in our TV programme. For this, you draw a picture of an owl on your TV screen. From that point, the owl picture always there, but its visibility depends upon the rest of the imagery onscreen. When the dark scenes of the TV show switch to a bright white scene, suddenly the owl "appears" - it is "manifested". Now we adapt this to daily life. Imagine an owl idea being dissolved "holographically" in the space around you, and replace the notion of dark/white scene with appropriate contexts. Having "drawn" the owl into the space, you go about your day. Mostly the owl isn't anywhere to be seen, but wherever an appropriate context arises then aspects of the owl idea shine through and are manifest: A man has an owl image on a t-shirt, the woman in the shop has massive eyes and eyebrows like feathers, a friend sends you an email about a lecture at the zoo highlighting the owl enclosure, a newspaper review of Blade Runner talks extensively about the mechanical owl in the interrogation scene, and so on.

Now, the more specific you get about what you intend, the more you shift from creating a general pattern, to a more focused experience - an scene which implies a new situation. So, imagining spending time with your ex-girlfriend again, implies that you have got back together, since this is required for the scene to take place.

[COMMENT]

*Q1: Hmm interesting. It seems to me when people are in a high vibration and want to get back with an ex-partner utilizing their knowledge of LOA(i.e. they are not doing this because they need to, but rather they want to), they are doing it for the following reasons:

1. To go on a quest for love (the fun is in the journey)
2. To actually have an IMPROVED relationship with the person and be validated by said person
3. Be validated by other people that you were able to get back your ex-partner (in my experience, most people seem to discount your ability to get back with an ex-partner; or when you do, they look down on you for going back with such a person)

4. To feel a special relationship with the universe (I.e. they are in control, that they know how to use LOA to their benefit)
- So it seems to me people want MORE than just to get back with an ex-partner. Just getting back with an ex-partner is easy. All you have to beg and grovel, and they might take you back all the while treating you like crap. But no one actually wants this.
- How would you go and manifest all of the above goals? It seems like a more complicated request, which is why so many people have trouble with it.

[END OF COMMENT]

Yeah, I agree that people don't necessarily want "getting back" - they want something else, and they target the "last known version" of that, which may in fact really be a strand of experience from much earlier in that relationship. I'm not sure it's more complicated; the same principle applies. So, let's stick with our owl example. What if instead of owls, what you really wanted was the feeling of excitement and companionship that being in the presence of owls gave you?

Well then, the same "pattern-triggering" principles apply. You would imagine (i.e. summon into awareness) the feeling your would have in situations which had those properties. By doing so, you are activating all associated patterns which have that feeling as part of them.

(This is the same reasoning behind having people go around saying "it's so amazing! life is so wonderful!" to trigger a feeling of happiness, and therefore all patterns which are associated with a happiness feeling.)

In our relationship situation, we'd pause and seek what the actual experience of what we want would be - and summon that into mind. Again, thereby triggering into prominence all experiences which would give you such a feeling.

What if I don't know enough about a specific person, but would like to get to know him well to see romantic potential, would imagining doing things together help in any way?

Yes, just imagine spending time together or an interaction which means that you are spending more time together. Choose a specific scene which means-that you would be more involved, and imagine that scene vividly with full feeling, knowing that this means you will be spending more time together.

I have exhausted all straightforward options. Expert consensus is that he might have Asperger's.

Well, that's something to take into consideration, if it is the case. In my view that pretty much corresponds to narrowed attention, which leads to a sort of "situational blindness". I've been through a period of this myself in the past, triggered by over-focusing, so I've spent some time pondering this, to avoid making the mistake again. Read a recent comment here [<https://shorturl.at/h5woq>] for an angle on it, if you're interested.

Off topic, but some further thoughts, in case they come in handy - The essence is, he is literally unaware of his "direct sense" of the underlying meaning of an interaction. Whereas you just "know" what's going on in a social situation or a conversation, he doesn't. And he is also probably unaware that there is such a thing and that he is unaware of it. You should assume he understands the world in terms of thoughts-about it and work from that - don't expect him to intuitively know anything. He'll appreciate it if you just say things straightforwardly in words. Say what you feel, say what you want. So if you want to spend time with this guy, literally tell him that. Say "I like you and I'd like to spend time with you. Let's do this thing.". You might need to persist, because by then nature of this he can't properly imagine in advance the good feeling that will come with it. More generally this means avoiding situations where you are expecting to him to take spontaneous "creative" action, or has to make a decision or anything that comes from he felt-sense that you operate from, because he has minor difficulty "feeling out" what to do quickly using that. You'll have to keep him on track a little! But once he's on track with you and feeling safe, if that's what you want, then he'll be narrowed on you and potentially the most loyal and maybe "dreamworld-exciting" person you could ask for. Or, you could teach him how to open out his attention and give him situational awareness. (See an article here [<https://shorturl.at/xhXik>], fun exercises here [missing], for instance.)

Do people with Asperger's feel emotions? Can they miss someone or fall in love?

I can only say from my interactions, and me rendering myself "focused" for that while, that - yes - of course they have emotions, but they often don't understand them, because they are attentional focused on their thoughts rather than that felt-sense I was referring to. As you can imagine, it's not very easy to work out how you feel using the intellect, just as they find it difficult to work out the gist of a situation. It's very slow, for once thing, and very "theoretical". They get "stuck", therefore, when there is tension to anticipation, which tends to make them focus in their head area more.

I assumed he would take the lead from then on, but he didn't.

So, yeah, that's pretty much what I was pointing to in that last message. For starters, he won't have known quite what to make of your email; he doesn't 'get' subtext and flirting. Or to be more specific: he might think that's what's happening, but he can't be sure, not in the way that you just "know" these things. He obviously likes you though, which makes it worse for him. As to the questions, he was feeling super-tense and stuck and pushing through it to connect with you. Imagine you and I were sitting opposite one another chatting away, and I asked you how your work was going. And nothing appeared in your head. Nothing. That "feeling" you have where responses automatically come from, it just stayed still. Your flow has stopped! So, you're forced to "manually" create something to say, by maybe mentally scanning your current "facts" about work, and construct a response. Then hopefully thinks start flowing again. For him, his flow keeps stopping whenever a novel situation comes up, and he has to restart it manually.

Do you have any ideas? I really like this guy.

Invite him to things, ask him about things directly, imagine that the words you say are the only information you are providing to him. All of that stuff of (sometimes unwittingly) trying to get a partner to do things you want by "hinting", so that they do it "by themselves" and you can feel they did it spontaneously for you - that won't work. If you want to continue, you're just going to have to accept that. If you do, stick to the "let's do this" approach for going on a date, and maybe set up something regular - like always going to lunch together on Thursdays, that kind of thing. And occasionally remind him that you really like him, and like spending time with him, because he'll doubt it occasionally.

Also, if he sees me behind him on the way to lab, he stops and walks back towards me so that I can catch up with him, I find that super sweet. :)

Yeah, see? There you go.

Does the "dreamworld-exciting" person mean anything more than it means in common parlance?

Y'know, some of these people have their own "reality bubble" going. Adventures follow. It depends on the imaginative momentum. So yes, overall you just have to bear in mind that he doesn't do "covert" or "subtext" in either direction, therefore the normal subtle games that people play don't work here. But then, it might be nice to live more directly for a while eh. However, if you do get together and become a longer-term thing, you might do him and yourself the favour of encouraging him to experiment with centring his attention in his lower abdomen, as a way of getting in touch with that "global summary feeling" you take for granted.

How do I increase my imaginative momentum?

Well, I mean more on his side. It's a side effect of being very focused, that you can end up (unwittingly) going on adventures and the world kind of lines up with the narrative you've adopted. Um, you could play with this yourself, if you like. Simply choose a theme for the world and focus on it, live from it. Look for signs of it, imagine that the world is based on it as you go about your day, and just decide that this is what's going on. (I strongly recommend that you do not choose "secret spies are monitoring my every move", however.)

Very quickly, you'll find it'll move from "I am just noticing things that match my theme" to "external events are occurring consistent with my theme" and then "it really looks like I have coincidentally stumbled upon something that's actually happening in the world". If you want to play it safe with a harmless version of this, you could spend five minutes right now, just imagining that there is an owl in front of you in this room - look at it there, doesn't need to be vivid, just mull it over and know it's there - with the knowledge that "imagining this owl means-that owls are everywhere, and my life will be filled with owls from now on".

Ah I see. So the owl exercise will make me see more owls?

It will trigger the extended pattern of the concept "owl", and overlay it over your experience from that point onwards. Just do it and you'll see - it's fun (although you'll understand why I urge you to choose your themes wisely). Typically, it will start with things you can dismiss as confirmation bias ("I'm just noticing owl imagery that was

there anyway") but will progress towards something else: Internal > External > Eternal.

Also, regarding the guy, do people with Asperger's prefer planning stuff over emails or in person?

How about: probably better over email initially - but, y'know, you can always ask him what he prefers! :-)

He is such a shy cat. I don't want to scare him off. :) I was thinking of asking in person because he didn't reply to my date mail. But he did reply "Yeah, definitely" when I mailed him about coffee the first time.

Haha! Well, if you've got something specific in mind just go say it I guess - that's not planning, that's telling! ;-)

Meanwhile, did you try doing this? [The Act is The Fact - Part One: An Exercise] I can't remember if someone linked it to you before.

I did that last night :) Once would do right?

Once would do, indeed!

Those labels are just fine. The point is that you know what they mean, or what you mean by them, and the situation is shifted towards that accordingly. So, you just follow the last instruction ("carry on with your life") and see what happens. Perhaps things will happen with this guy; perhaps things will happen with someone else; perhaps one will be the connection to another. The change is already made, so just relax and go with it now. (Note: there's no need to "force" things or make anything happen, in other words.)

Thanks! I still visualize spending time with him though, mainly because it is fun :) I will stop doing this when it becomes a desperation.

Oh yeah, no harm in that, I just mean you don't need to work things out, it's no problem to enjoy imagining the nice things.

I saw a girl wearing a striking owl t-shirt today, a large golden owl in black background. Pretty cool, right?

Ha, that's good! Yeah, the owls thing is indeed fun. :-) The next stage is: seeing owls which come to you via events, rather than just apparently already being there in the environment. My recent owl spotting: went on a cycle yesterday and stopped a little cafe. Coffee, cakes and, for no reason at all, a whole table of stuffed owls for sale, made by a local craft person.

I have one more question about Asperger's. I just got back to my city after 2.5 weeks of travel. I saw him this morning, he looked nervous and waved without looking at me and then walked up. I am so puzzled. Is this aspie behavior?

Well, I'd say they're both aspects of the same thing? Narrow attentional focus inside = super-shy-awkward. Narrow attentional focus outside = super-babble-sharing. I mean, if someone was just a very nervous person, would it be so different? The more comfortable he becomes, the more that would settle out I'd guess.

If only he would state things clearly. So this morning's act is not necessarily an indication of dis-interest then?

Not at all. He obviously likes you. So from now on don't bother looking for signs, just assume that's true. I know it's not the usual way, but that's how to do it.

Do you say this specifically because he has Asperger's? What concerns me is that the indications of interest/dis-interest that I(as a normal person) decipher does not apply here

Hmm. Well, it'd be wrong of me to come over as being some general expert here, since my angle on this is based strictly on how a constrained attentional focus affects perception and behaviour. If you stick to the "often doesn't pick up situational signals" and "is shy-awkward and doesn't have confidence in his judgement sometimes because of that", that's probably as far as I'd confidently assess the situation. But to me, his wave-not-looking awkwardness and focused-over-sharing sounds like he likes you and is a bit nervous.

I am not used to being very literal in romance, but it looks like that is the only way to move this forward.

Ooh, what a great title for a movie: A Literal Romance. It's got that A Beautiful Mind vibe and everything. Anyway...

The "something" he sudden becomes aware of his probably: himself! And he's maybe a bit of a loner because just random interaction is probably a bit tiring if you're quite self-controlled (until he gets going!), and he's crap at chit-chat so making middle-ground friends doesn't happen so easily (ones between acquaintances and close friends). But y'know, let's not overanalyse the poor guy. Put aside you're inferences, deal with "just the facts, ma'am", and you'll do okay. If it doesn't work out, oh well, it'll have been an interesting experience.

POST: Attachment (/r/lawofattraction/)

Passing thoughts are not a problem, any more than a passing itch or a muscle twitch. It is willed imagination that is problematic. The tricky bit is dealing with creation by implication. So, if you squirm away from a bad image, you are implying that there exists something to squirm away from. You are effectively wilfully imagining being in a situation where you squirm away from a bad thing. This will seem off-topic, but the method described in this post about lucid dreaming 'realms' kinda gets to the truth of it, I have thought. The approach he uses is to imply something is the case, and then the dream 'autocompletes' the creation. This is why our everyday life is full of situations which we might say: "Hey, if I'm the creator, I wouldn't create that!"

Q1: I find that Meditation does help, But I also find letting go and living your life to the fullest every day helps as well. To me that is the Key, the more you live each day to the fullest and let go, the more the things you desire come into your life. Things you want and desire happen in the most unexpected ways, and you cant plan on how it will happen. Example in College I had the dream of traveling and filming the world. But having no money I didn't know how to do that. I put it aside and just decided to live life. Life has brought me to my career working in an airlines giving me the benefits of flying, So I am able to live the dream I had a few years back. I would have never thought of this career would be the way it would have happened.

This is pretty good. Where things like meditation and other more forceful techniques help is when you want to "bend the rules" a little. Most things will shuffle in your direction, in some form, eventually. But if you want them next week, you might need to deconstruct yourself a little.

Infact my wantings have almost subsided or have somewhat died.

I think we end up discovering that our "needy" desires are often about something else? And when we open out a little, the urgency of those subsidies. Ironically, the position that lets you generate what you want most easily, is the position where you're not that fussed! :-)

The feeling of being detached and allowing the experiences of life to arise automatically is so relaxing and blissful.

Right, the relaxation into being the "open aware space in which experiences arise". When in that state, you can let things unfold quite effortlessly and spontaneously, just occasionally "deciding" a change. Although if you are totally in it, the arising of the thought of the decision is the deciding. In case it's useful, the 'passive' version of Overwriting Yourself is one approach I've taken. Basically it amounts to letting yourself 'unwind' without interference. I might as well throw in the Patterning of Experience thing too, even just for the Imagination Room metaphor (linked) which I've found useful as a reminder.

...Ah, interesting you posted these things together. See if this fits with your experiences: When people use the "Neville" technique, or imagination in general, they often narrow their focus to do it. This has the side effect that your self tries to cram itself into that little space, resulting in tension. Really, you are meant to be open and "let the world come to you". You aren't meant to "do" the imagining; you are meant to trigger it and allow it. So the meditation you describe is similar to what I do - nice! Although I conceive of it as "switching to the background". If I'm ever "stuck" then I more directly "expand" into the space my body occupies and then "expand" into the room around me and beyond. So long as you don't do this effortfully, it's great. Maybe "feeling out" is a better phrase. The longer you do the 'passive' thing though, the less you'll need to do it I think - your default will be more open.

(I'll check out Mr Kinslow - thanks!)

And then we realise an important thing: We might notice we've developed a bad habit of concentrating or narrowing our attention when we do something. But you don't need to do that. Your attention shouldn't be controlled by you at all. You might will things but you don't "do" them; and holding onto your attention is a subtle way of trying to "do". Btw, that little insight is a great way to get your eyesight (or should I say: visual perception) back if you've had some loss there. Leave "seeing" completely alone, release your attention and let the world appear within you.

Your examples are instructive!

My personal experience has been that I have in the past...

I think overnight shifting is fine but if you continue to view the outcome as special or dreamlike or temporary, then it doesn't stick because we never really fully committed to it. When things happen indirectly - we don't imagine them fully - then we are more inclined to think of them as real and stable. Even though there is no difference other than the detailing.

The 1st technique gives me a great sense of power and control over the process while the 2nd sometimes makes me feel helpless...

The halfway house, perhaps: To imagine but let the detail of your imagining "come to you". That way you can view it as triggering a pattern with the pattern already existing. You are simply selecting it into experience rather than creating it. (Creation by implication.)

You actually see this trick used in lots of approaches: usually it's phrased in some variation of "your desire is already there". It's a fake but it's the same fake we use in everyday life to live in an ongoing, continuous, apparent world.

I now feel that letting things happens on their own...

So we can integrate both approaches and realise they are a single approach, maybe? And the integrating concept is "imagining that": Relax as the open space and let the world come to you. If you want to make a change from the way things are spontaneously going, use willed imagination but do so by imagining-that rather than imagining in detail. By which I mean, if you wanted to encounter owls you wouldn't "draw" an owl using your imagination. Instead, you would imagine that there was an owl in front of you. You'd let the actual imagination-object form itself as result of "imagining the fact of its presence". Alternative description: you are "asserting a fact" and letting your sensory experience spontaneously fall in line with that.

...Depends how you are thinking about time. Regardless, you should consider all facts as being true now, independently of 'when' they might be experienced in the senses: Examples (you don't actually say the words, it's just what you are willing):

- It is true now that I am imagining this (for just creating a visualisation)
- It is true now that this will happen then (for creating a fact, which will imply a visual as a side-effect)
- It is true now that I am imagining this which will happen then (for creating an visual which will imply the fact).

What matters is what you are willing (and we might call that the "meaning" of the imagining). The broader point is that our sensory experience - anything in awareness either thoughts or perceptions - should be viewed as a transparent floating 'mirage' over the sand dunes of the facts-of-the-world. What we imagine doesn't matter so much as the will that something is true. Not sure that was very clear I'm afraid. Note that by "imagining" I don't necessarily mean an image. The "feeling of being true" is an imagining. (You can see I haven't quite worked out a consistent language for this!)

Would I 'will' by simply feeling the emotion of what I desire as if I had it now?

EDIT: This is a tangled area linguistically, because you don't actually experience "willing", you only ever experience content and results. But you know you do this.

No, I'd say the emotion would just be the imaginative content. In general, by "willing", I basically mean "the force of yourself" given to an intention. Otherwise you are just playing around with your imagination. Which does have an effect via synchronicity, but you're not really harnessing it. If you imagine an owl (my favourite) for a few minutes, that alone will produce a few owl appearances just because you are focusing a little on the image, but it's undirected. If you imagine an owl with the intention that you will experience lots of owls then that's a directed image.

- Using imagination does produce effects via synchronicity (you have triggered a pattern in imagination and it then appears in experience), and the more detailed you are the more specific the result.
- The willing is the actual "magick". You can actually do willing without imagination at all because simply having the idea, an intention, is to have activated a pattern. It is this pattern activation that makes things happen. The imagination is just putting more detail into the intention, and giving yourself an experience of "doing".

As to emotion, well in the example above you are generating owl experiences without regard to them being good or bad. If you include an uplifted, excited emotion into image, than that further narrows the experience your have requested, the pattern you have activated. Check out this multi-quote from Carlos Castaneda [POST: Some insights from lucid dreams] for a nice take on "the will". (Think of him what you will, he did have a good turn of phrase.)

'Will' is not Willpower.

It might be fun to try and pin this down. **Will is basically creation itself**, it is the changing of the shape of yourself into a new pattern. So if you will something to happen tomorrow, you are directly "changing the shape of tomorrow, as it is exists within yourself right now, such that this event has-does occur". As a result you can't feel willing or experience it, because it is not separate from you and there is no viewpoint from which it can be observed. You might choose to apparently create indirectly - to create two experiences, one you call "cause" and the other "effect" - but in that case you have simply taken on the shape of a larger pattern. Your will always operates in the "right now", creating that pattern across time right now.

It's hard to describe. I mean, how do you see or hear? You just do it. But it's the difference between having a 'technique' and it working or not working. It's sort of a commitment to something being a fact. Here's a little experiment which can give you the experience: Get a friend and challenge them to an arm-wrestle. Do this twice.

- On the first attempt, use all your muscle power to attempt to win the arm wrestle, as you normally would.
- On the second attempt, withdraw your 'presence' from your arm and simply "strongly decide" that you are going to win the arm-wrestle. Now, resist the urge to interfere - leave your arm alone and simply let your arm do the winning for you.

That "strongly deciding" is the willing. It is that which brings about the result. In this example, you can will muscular movement or will the result. When doing LOA-type things we want to use the second sort.

POST: Living in the Present...hard/help!! (/r/lawofattraction/)

Lightly centre your attention in your lower abdomen rather than in your head area - or at least include it in your attention - and "move from there" when you move your body about. Meanwhile, treat intentions as "fire and forget". Spend a bit of time each day attending to what you want to have happen, imagining it as if you already have it, enjoying that feeling, with the intention that doing so means-that it is true - and other than that, just carry on with life normally, letting it happen as it wants, letting things come to you.

POST: Addicted to being right? (/r/lawofattraction/)

"I'd far rather be happy than right any day." [https://www.youtube.com/watch?v=cPWnitDyIOw]

I mean, basically you are getting what you want, right? Eventually you'll get fed up of that, and want something else. You might want to want something else, but right now you don't really want it. Logic doesn't really come into this. So, let it play out. When you do finally want to be different, however, then it's easy:

- You let passing thoughts that don't line up with what you want go past.
- You only deliberately think thoughts that corresponds to what you want.

POST: kind of hate my degree. help please! (/r/lawofattraction/)

Perhaps treat this as a challenge - you aren't enthused about your degree but despite that you are going to use it as a project for practicing your focus and intention. Do it just for the win, and revel in your ability to make it happen. Then, once done, you can start thinking about other things you might want to do.

POST: What are the "limits" to the LOA? (/r/lawofattraction/)

The restriction on asserting another person's experience doesn't necessarily restrict what you can have as your own experience of them; our experiences aren't necessarily happening "at the same time". The underlying assumption to the argument is that "we are individual people in a shared, spatially-extended place unfolding in time" may well be false. This assumption arises, I suggest, from the idea that the world-as-it-is has the same "formatting" as our ongoing sensory experience. However, experiences with the "law of attraction" or other "intentions that disregard the usual worldview" tend to indicate this should not be taken for granted. Experimenting with directly updating other people can bring results - but you need to view it in terms of updating your experience of them, rather than their (hypothetical) experience of themselves. "Free will" is a 1st-person concept; extending it to 3rd-person perspectives might be an error.

So, one approach would be to say that the world as it truly is, is structured in such a way that everyone can experience what they want as if they had their own "private copy" of the world. In other words, the world is not "simply-shared" like a place, it is "abstractly-shared" like a sort of shared toolbox of potential patterns. Then, the sense in which "when someone enters your life, they are a lesson or a blessing" is that if you intend a particular outcome, then the path between "now" and "then" becomes defined at that moment, and inevitably contains events and encounters along the way which lead you from "here" to "there" - including people-based events. For example, if you intended to be successful in a particular career, events and encounters might include: meeting a person at a party who knows about the industry (blessing: make contacts and learn facts about that business), meeting another person in a particular office who is nasty to you (lesson: how to handle the unpleasant side of that business environment in future), being involved in a car accident (blessing: made you contemplate life, stop procrastinating and get on with switching career), and so on.

Note: the "blessings" and "lessons" that arise are not of the form of "messages from the universe"; they happen simply because you've put a stake in the sand saying "this will happen", and the pattern of the world shifts at that moment to accommodate that fact. It's like having two poles in the sand representing two facts - the fact of how things are now, and the fact of this future situation - and there being a string between them, which winds its way around the dunes and any pre-existing poles. It is a "dumb patterning system" based around a landscape which can be sculpted by intention.

POST: Crossover - Dimensional Jumping + LOA (/r/lawofattraction/)

Now LOA is a source of perspectives on jumping that isn't as...scifi or esoteric.

Ha, I have to say, I've always thought it was kinda the other way around!

Although, I admit, superficially the concept of "dimensional jumping" seems science fiction, but in the context of that specific subreddit that's not quite how it is presented. (It's more like a model or pattern one can adopt, rather than an actual "how it works". There is no fundamental "how it works", it is suggested.)

dimensional jumping is trying to re-invent the wheel, ignoring that the principles have been part of spiritual practices...

Although, I'd suggest that the subreddit isn't doing that, as such. The subreddit is about encouraging an examination of one's assumptions, by triggering experiences and contemplation, so that nothing is taken for granted. Even the concepts of "the world" and "reality" and "me" are suspect. The "dimensional jumping" part, then, is just a way into that, really - as the sidebar indicates, it's just one model amongst many. (Although this exploration - deliberately - takes the form of an ongoing conversations in the comments, rather than in the submissions and the subreddit setup.)

The "principles... of spiritual practices" are something to be explored, not accepted, I'd suggest. They all come from a particular culture, speak to a particular environment, the perspective of their time. There's nothing inherently special about them, in terms of their content. It's more about the "gap" they point to, the context of their descriptions, that's ultimately important. In a way, the wheel has to be continually reinvented, in order to keep it wheel-shaped!

Jumping isn't as developed as the LOA practices.

That is to some extent deliberate, really, although I'd say the "patterning" model that underlies the suggested exercises is quite fully-developed. But of course, the models are intended to be adjacent descriptions ("parallel constructions in thought") and structures used for intentional shaping of experience, rather things which capture "how it is". It's about building a bridge between what can be conceived of, and what can be adopted as experience. Because, "what is really real does not matter", as you say, if it is only temporary and can be imprinted upon, or shape-shifted by adopting a particular fact or pattern. Rather, having recognised the only thing that is fundamentally true (that is, the fact of the property of being-aware), all other facts are seen as relatively true only.

POST: How do you know your beliefs are true? (/r/lawofattraction/)

I suppose all "facts" could be said to be inferred from moment-by-moment experience plus the conceptual frameworks you have adopted. The only thing that is directly or fundamentally true, is that you are having this experience right now. Anything about that experience is parallel construction in thought: a connective fiction. It is only relatively true, as part of the "castle in the sky" knowledge structure of which it is a part. Strictly speaking then, we never experience the past, we only experience The Now. We occasionally have experiences "about" the past, but those also arise in The Now. Really, there is no past other than as an ongoing story we've created, which we use as a reference concept. We might say that the planet isn't actually any particular age at all and was never created, outside of our conceiving of such things - at least, it isn't those things in the format that we can conceive of it. Coming back to down to earth (ahem), really there are different "pasts", and they are achieved by sleight of hand. For some groups of people "past" = "carbon dating + isotope model + structured timeline concept", whereas for others "past" = "residual patterns + unstructured event model". It's meaningless to ask which one is "right" or what to believe, because they are all wrong in a fundamental way - what matters is whether they are useful and in what contexts they are useful. Alan Watts has a nice metaphor for this: the ship and its wake. Consider: Does the wake cause the ship, or does the ship cause the wake? What does the water represent in this metaphor?

POST: Spellcasting Magik and LOA? (/r/lawofattraction/)

Q: It's a good way to allow your imagination to be free from the usual resistance if it's fun and interesting to you. It's a "faster" way because by taking the trouble, you can step out of the old mindset of restriction or your perceived "reality". That's the value of rituals because by doing things you normally wouldn't do, you can switch your mindset for a while. At the same time, you can just ditch your resistance and let your imagination do the work, too.

"Ditch your resistance" is a very good way to describe it. We should print t-shirts...

All these approaches pretty much amount to:

- Be okay with shifts arising in the state of yourself and of the world.
- Assign a meaning to an act: "this act means that will happen" or "that this is true".

- Perform the act.

The act you perform can be mental or physical. It makes no difference, because there's no difference in nature between the two: all acts are just an experience in the mind (your "perceptual space") anyway.

Sounds very much like Wicca I love it

It's also how you move your arms and legs every day! :-)

The oddity of that statement is somedays I can't really move my legs due to neuropathy :(

Hmm, coincidence in action there, with my choice of example. :-(Out of curiosity, have you tried doing anything "of this sort" to help with that?

Q: Yes indeed. I did a ritual healing bath with sea salt the other night, I cast a spell in the circle to start healing my neurons and removing the autoimmunity. But I would love to know "better" spells/ritual that I can cast during the Full Moon to help speed up healing the "incurable" . I'm sure something as simple as "I am cured, healthy, and can walk freely, so mote it be!" is more than suffice. But perhaps there are certain herbs, crystals, etc. that can make that intention even more powerful? Maybe burning a sigil? I don't know.

I think that, really, spells are just a cover for intention + allowing shifting. No spell is "better" than any other. Although some are definitely more fun than others! :-)

The problem that comes up is, a lot of people don't know how to intend, or even know what that is. Instead, they just do physical actions. But those alone don't really have causal power, other than the usual very localised habits, so this is kind of pointless. The only purpose of the actions is to be a "handle" by which an intentional pattern is triggered. The stripped-down essence I've had people doing is the Two Glasses Exercise. It smuggles intention and allowing into an activity via misdirection. Really though - if one could just let go and be okay with any shift whatsoever taking place, you could pretty much "just decide" on a change. Have you tried lying down, relaxing, and then mentally "sitting with" the problem area and seeing what comes up? As in (language will fail me here), placing your awareness or "presence" in "the volume of space where the problem body parts are" and, pausing, seeing what comes up? Maybe then, after that - "asking" them to get better or imagining an appropriate "mental machine" that might do that job, depending on preference.

(Just throwing out ideas that occurred to me as I was reading your comment.)

POST: Purpose in Life?...(i dont know) (/r/lawofattraction/)

Go with the flow, because you can't know [things in advance]. Just do course corrections whenever you find yourself desiring something in particular.

Q: Alright, so im working at this job, and i belive that when im always focusing on the aspects of what i love, the Universe will present more Jobs with the aspects i love and ect, is that alright to do? and what do you mean by
do course corrections whenever you find yourself desiring something in particular
Thanks.

Sounds good to me. On course-corrections: I mean that if you do find yourself is a spot you don't want to be in, then that's a good time to deliberately change course via some form of intentional act (LOA or similar). It sometimes happens that we might have a situation which isn't resolving itself, and so we specifically target that. As I say, you can't know everything in advance, because you can't know all the patterns that are contributing to your experience, so you have to deal with undesirable things when they appear, as they will occasionally do. Think of it like "debugging" yourself: it's only when an error appears visibly that we realise there's a tweak to be made.

Q: Cool!
if you do find yourself is a spot you don't want to be in, then that's a good time to deliberately change course via some form of intentional act.
So kind of like gaining clarity right, to focus on what i do want!

Right. So in a way, it's like gradually coming to a better and better understanding of yourself. You notice the 'world behaviour' (which is really an extension of you) and go, um, that's not how I want to be, and then make the change.

POST: My biggest success and biggest problem with LOA... (/r/lawofattraction/)

Let's just say up front that there's not much point in talking about what things were prior to your birth, and that it's meaningless to talk about someone "intending" something when they don't know what intention is (e.g. a child). So nothing is deserved and nothing is your fault, the good or the bad. The universe (or whatever you want to call it) is "stupid" in that sense. It is you who are the intelligence, and you can only apply that intelligence once you realise what's going on. So, maybe imagine that at the point of birth there is a landscape, and our life is like our attention flowing across that landscape from one end to the other. We cannot know why the landscape starts off with the shape that it does - it happens "before" reason and logic. It just is, and our ongoing experience arises from it. Any ideas about us deserving this initial shape are just us trying to create a story to fill an explanatory gap that can never actually be filled. What the "Law of Attraction" says, though, is that once you're aware of your situation, it is possible via "intention" to deliberately modify the shape of that landscape - and thereby change the content of our ongoing experience from what it would otherwise be. Responsibility starts at that point, and even then only for your active intentions. You cannot be responsible for every future as-yet-unseen contour. I think the word "attraction" in LOA is often problematic, since it conjures up an image of objects and circumstances moving towards you across a space, like we're dealing with magnets and must maintain a particular orientation, and it implicitly suggests a notion of "deserving" and detailed control. I think it's probably better to view each instance of it as a shifting of state, an adjustment of one section of that landscape, with the rest of the surface being moved accordingly. That way, we can remain comfortable with the inherent mystery involved in this. We have inserted one experience into the landscape, sure, but that does not mean we have deliberately sculpted the rest of it. It is still the case that we won't know the contours until we get to them, because we cannot have the experience of something before experiencing it. It also emphasises that it's not about maintenance after the intention, it's about having the confidence to not interfere (or "re-intend").

POST: You need to actually read or listen to Neville (/r/NevilleGoddard/)

It's not so much about "talking down" the Law of Attraction, though? It's more about highlighting that LoA employs a different set of metaphors as compared with Neville's writing, and how mixing those metaphors leads to confusion - or empty pronouncements that, while "inspirational", are essentially meaningless because they have no grounding beyond some sort of general optimism.

For sure, the truth of things is always the same - that's why it's "true"! - but that goes without saying, and is not the issue. There are different descriptive frameworks as a way into "the truth and how to use it", and talking about one (Neville) in terms of the other (LoA) tends to create an unhelpful muddle. Hence lots of questions that people are asking here essentially resolve into having Neville translated into LoA-speak, unhelpfully. Or worse: a question isn't asked, the LoA perspective is just assumed and then the contradictions argued about.

It's like walking into an impressionistic art class and asking everyone to explain their paintings purely in terms of optical physics (or vice versa), or assuming that they will. Ultimately they're still talking about "painting in practice and outcome", but there's a definite choice being made in how to approach it conceptually - “brush strokes” versus “light rays” - even if the desired result is similar. The experience of the final painting is the same, but we wouldn't say that the two perspectives are identical, nor that one perspective was "based on" the other.

Personally, I do think that LoA is a much more vague set of concepts, and that "attraction" is not a good metaphor for the basic fact of experience, since it implies a spatial and temporal aspect, a separation between "you" and "experience" and the notion of something "happening" in between.

In contrast, Neville's approach to this - that creation is already done, that what you are is the context of that creation, and that to change experience you change your (impersonal) state to make some facts more prominent than others - manages to avoid that, while providing a tighter framework less prone to "inspirational" thinking. The different way the two frameworks handle the nature and operation of "visualisation", for example, highlights how much more complete, and therefore useful, Neville's approach to description is.

Hence, maintaining the distinction between LoA and Neville as parallel ways of conceptualising the nature of experience (and the nature of descriptions about experience), is surely valid.

Do you decide? In your own best interests? (r/ADHD)

Do people find that life, and your impulses and thoughts, buffet you about randomly - to the extent where you realise you don't even decide what you'd like to happen never mind make actual plans for your personal self?

Using hyper focus seems to be about getting locked onto, say, a particular piece of work, which may or may not be in your actual best interests personally, for instance. Do people find they don't actually stop to decide, **is this the best thing for me?**

TriumphantGeorge Compendium - Part 33

/r/Oneirosophy Highlights

SIDEBAR: OVERVIEW

Oneirosophy means "dream wisdom"

This is a place for idealists to further their lucidity by discussing techniques and anything else related to idealism. Techniques may include but are not limited to: contemplation of skillful ideas, meditation, magick, yoga, and lucid dreaming. Sympathetic individuals are encouraged to post their own ideas and practices to prompt discussion.

The foundations of Oneirosophy are:

- **Lucidity** - A state similar to gnosis or satori where one regains consciousness of the illusory nature of waking reality, just as one becomes lucid in a dream.
- **Idealism** - All of waking reality is a mental structure, a dreamed reality.

Matter is an idea in the mind.

POST: Oneirosophy is not "the secret"

7Kek7: Its not a magic genie lamp that will grant you all of your material desires

I disagree, when I want it to be, **it has literally been a genie lamp.** Changing one's perspective on experience and letting go of materialism is great. But the real power is in then shaping that experience to one's desires.

Giello: Oneirosophy provides a model through which one might understand how or why the Law of Attraction/"The Secret" works. At least, that's how I see it.

POST: Some quotes from Tibetan Buddhist masters (By **dharmadhatu**)

When you start to dream, the dream begins as a thought, like one you would have in the daytime. But you're asleep, so the thought intensifies and becomes something like talk or gossip, and then the gossip intensifies or solidifies into images, and then you really think that you're seeing people, seeing places, going places, and so on. And that is how it works with conventional appearances as well.

-- Thrangu Rinpoche

At first when you pass into the dream state and images arise, you may not remember where they came from. Your awareness, however, will naturally develop until you will be able to see that you are dreaming. When you watch very carefully, you will be able to see the whole creation and evolution of the dream. Through this practice, we can see another dimension of experience, and have access to another way of knowing how experience arises. This is important, for when we know this, we can shape our lives. The images which emerge from dream awareness will intensify our waking awareness, allowing us to see more of the nature of existence. With continuing practice, we see less and less difference between the waking and the dream state. Our experiences in waking life become more vivid and varied, the result of a lighter and more refined awareness. We are no longer bound by conventional conceptions of time, space, [force], and energy. Within this vaster perspective we may also find that the so-called supernatural feats and legends of the great yogis and masters are not myths or miracles. When the consciousness unites the various poles of experience and moves beyond the limits of conventional thought, psychic powers or abilities are actually natural.

-- Tarthang Tulku

POST: Life not feeling real.

A1: Please try cloudbursting. Look at the sky for a few small clouds in a group. Do not tell anyone. Then pick a cloud that you want to disappear. It will. This and other reality-bending experiments will prove to you that your mind is connected to, or maybe the same as, reality itself.

can you make clouds grow darker? Well over time

dreameraxelos: You can do whatever you want! Everything is part of your dream, so you alone have control. However, some things may seem from your perspective to be more difficult, at least at first. That's why I suggest beginning with making clouds disappear first. It's easier for your mind to accept. Once you have experience with making clouds disappear, you can move on to making them grow, move, appear, darken, lighten, etc.

POST: Why materialism is ultimately rooted in faith. (By **cosmicprankster420**)

This took me awhile to realize fully, but it was only when I probed into areas which I was hesitant to touch that it made sense. It is a common trope to label the materialistic scientistic types as following a religion, where as the skeptic rebuttal is its not a religion because it is based on evidence rather than faith. Lets really probe into the idea of evidence based reasoning. Now this is something that has been mentioned before on this subreddit, but I think it bears repeating as when investigated it seems to totally follow circular reasoning. Often times non physical anomalies/beings are denied because there is no physical evidence for them. The assumption is that non physical things cannot exist because the world is only physical. Think about this for a second, the skeptic is asking for PHYSICAL evidence for NON PHYSICAL things. This would be akin to someone being skeptical of the existence of solid crystal ice because there is a lack of evidence for it and only accepting evidence of said ice in liquid form. Have you ever wondered why debating with materialists seems like talking to a brick wall? they set up their game so its impossible for them to lose. If there is no evidence for a non physical phenomenon it is deemed unreal. If there is evidence for a non physical phenomenon it is deemed unreal because the evidence for the phenomenon is physical and not non physical. Materialism is ultimately rooted in faith because what lies underneath all of the logical loop holes and parlor tricks is no more then a gut intuition that the world is physical, and the circular logic of only physical evidence based reasoning as valid, further reinforces the faith in materialism. In fact I realize that my inability to question this assumption was based in faith based reasoning left over from consensus thought patterns and the fear of looking crazy.

POST: Contemplation upon the Gospel of Thomas (By **aconfusedseeker**)

Hello, friends. This sub needs more discussion to get the wheels of contemplation going. Only through contemplation can we progress in the ideas presented to us by oneirosophy. As it would happen, I've stumlbled once again upon Gnosticism during the uneventful hours in work, and I got to re-read the Gospel of Thomas in multiple translations. However, this time I tried to apply the idea of oneirosophy and subjective idealism upon the riddle of words that Jesus left us in this amazing Gospel. Particularly, I'll nitpick a few passages that struck me as possibly resonant with the dream reality. For this, I'll use the Lambdin translation

(2) Jesus said, "Let him who seeks continue seeking until he finds. When he finds, he will become troubled. When he becomes troubled, he will be astonished, and he will rule over the All."

This really struck a chord with me. When I first delved into non-dualism and oneirosophy, I was grasping at straws when it came to shattering the illusion of this reality. The materialist in me wept as the dogma of Christianity I have lived my not-so-long life and materialism based thinking slowly unraveled to the nature of our dream reality. I was a confused seeker that sought (as my name implies) and as I read more and more I became troubled. Now I am not so much, as I slowly lose fear of death, hell, and nothingness after death. I am astonished. The last words imply that just like subjective idealism proposes, we - every single one of us - could indeed rule over all (mayhap through Solipsism?) in the current reality. What do you think?

(3) Jesus said, "If those who lead you say to you, 'See, the kingdom is in the sky,' then the birds of the sky will precede you. If they say to you, 'It is in the sea,' then the fish will precede you. Rather, the kingdom is inside of you, and it is outside of you. When you come to know yourselves, then you will become known, and you will realize that it is you who are the sons of the living father. But if you will not know yourselves, you dwell in poverty and it is you who are that poverty."

The idea that indeed when you outsource the you that you have forgotten you are to somewhere else, you lose control of the dream. The kingdom of the father (Awareness, One) is within you, for you are the aspect of that Awareness that dreams all of realities in all of the time. As within, so without. Non-dualism. If you will not know yourself (as the awareness rather than the dream character), you will be trapped in the idea of materialism and self-inflict upon yourself misery as something that can't be changed, something that is outside of your control (poverty), but once you have known, you will stop being trapped in that (stop being the poverty and as such the source of it).

(4) Jesus said, "The man old in days will not hesitate to ask a small child seven days old about the place of life, and he will live. For many who are first will become last, and they will become one and the same."

This brings forth the idea that though we can see a seven old day child, the awareness behind that dream character is so much more than what is presented to us, and as such is presented also an idea of reconciliation into the One, for we come from the One.

(5) Jesus said "Recognize what is in your sight, and that which is hidden from you will become plain to you . For there is nothing hidden which will not become manifest."
(18) The disciples said to Jesus, "Tell us how our end will be." Jesus said, "Have you discovered, then, the beginning, that you look for the end? For where the beginning is, there will the end be. Blessed is he who will take his place in the beginning; he will know the end and will not experience death."
(36) Jesus said, "Do not be concerned from morning until evening and from evening until morning about what you will wear."

Recognize the dream for what it is - a dream, and nothing will be hidden from you, because you as awareness exist out side of time and space (you stand at the beginning and the end), and as such can mold the reality according to your will (manifest what you will). Thus, stop worrying.

(24) His disciples said to him, "Show us the place where you are, since it is necessary for us to seek it." He said to them, "Whoever has ears, let him hear. There is light within a man of light, and he lights up the whole world. If he does not shine, he is darkness."
(42) Jesus said, "Become passers-by."

Become passers-by. Detach yourself from the dream character you experience, even a bit, and observe the dream world for what it is.

(48) Jesus said, "If two make peace with each other in this one house, they will say to the mountain, 'Move Away,' and it will move away."

Perhaps this could be given the context of reconciliation between the dream character and the dreamer (awareness). When if you do, you will be able to change the dream (move mountains).

(77) Jesus said, "It is I who am the light which is above them all. It is I who am the all. From me did the all come forth, and unto me did the all extend. Split a piece of wood, and I am there. Lift up the stone, and you will find me there."

Maybe Jesus fancied himself a solipsist? :-)

Etc. There are many more passages that could be given the explanation of oneirosophy, while many seem incompatible with the ideas of it. I would love to hear your opinions. 'Tis but one perspective/way of experience of many, but perhaps we can glean something useful to us from it? Put your own spin on it, should you desire. We can learn much from each other.

...

What's the point of ruling over the All?

The better question I think is, "What's not the point?" Try to contemplate on this a bit more before reading on. In the end, you have to come to your own conclusions to any question you ever experience.

Truly, for everyone there will be many points as to why, but I want you to consider that once you achieve that state it is all the points. When you rule over the All, you in essence become the All (or rather, return to it), and every reason for becoming it. Unbound, limitless, like "(77) Jesus said, "It is I who am the light which is above them all. It is I who am the all. From me did the all come forth, and unto me did the all extend. Split a piece of wood, and I am there. Lift up the stone, and you will find me there." "

For example for you personally by your previous thread on this sub, I would say that it would mean liberation from the assumption of being created by the position of planets and instead becoming the creator of planets, so to speak. A flip in perspective and being. Reconciliation with your true self.

One could also assume that the whole proclamation Jesus made was an Ego trap. It is the Ego that drives you to power, which this phrase implies to promise. But when you strengthen the Ego, you solidify the dream character you play and thus solidify the dream instead of loosing it to achieve that state of true self.

POST: An Interesting Thought (By CriticalMission)

When we are awake, we know that we are due to internal and "external" factors. First off, our mind is at a heightened state of awareness, as we can logically reason about many complex ideas. Additionally, we "feel" that our environment is stable. Everything is as we remember it, in that we have an innate understanding that we are living in the world we've always know. On top of this, we have certain tests that we can conduct on our environment. These tests can be similar to those tests that lucid dreamers use, known as reality checks. For example, if we look at a clock, look away, and then look back we know that the time will either be the same or be different by one minute. Yet when we are dreaming, the clock will often show vastly different results each time that we look at it. But what if we have it all wrong? What if our dreams are a more true reality than the physical? Think about it. When we are awake we are very limited by the world around us. There are rules that we must follow. It's almost like we're trapped in a certain state of existence. Yet when we're dreaming we become free; anything is possible. And the more we dream lucidly, the more stable our dream environment becomes. Eventually one can lucid dream so much that one can begin to blur the boundaries between one's dreams and reality. The more powerful a dreamer becomes, the more "real" their dreams seem to be. Some can even experience dreams that "feel" more real than reality itself.

When we dream we have the power to control everything with our minds. Does this not seem like the most powerful state of awareness anyone can be in? The ancient stories of enlightened thinkers discuss beings who can manipulate physical reality with their thoughts. For example, Jesus of Nazareth was said to have brought someone back from the dead, cured the terminally ill, and gave a blind man the gift of sight. Whether you believe that these events actually occurred, or if they are possible is beyond the point. What matters here is the fact that someone capable of these acts would be considered to exist within a higher state of existence. When we dream, we exist within this higher state of existence. We are not bound by the laws of physics. We can fly, teleport, shape shift, manifest anything instantly, we're virtually limitless. We can still hear, taste, and touch. We can see and smell. We become untethered.

I once had a dream of myself just standing in the street. I was across from the home I grew up in. The crazy part is, everything was indistinguishable from my waking state. One moment I was lying in bed, eyes closed, everything black. The next, it felt as if my eyes were immediately opened. I could see the grass and the road. The mailboxes, the sky, the clouds; all from the point of view of ... myself. I looked down and saw my palms. I turned them up and down to acknowledge I was truly there. And then I woke up. Back into the darkness. Dreams are often not realized to be such until we awaken. But what if physical reality constitutes the real dream? We wouldn't know it until we wake up. Yet oftentimes when we sleep, we are not conscious. What if this is by design? We're not meant to be conscious when we dream because then we would wake up. We would realize that this physical reality is a construct build around us, not our true reality. We would realize that this world is more like a game than anything else. That the limitations around us are simply obstacles to be surpassed. That we play this game with ourselves because there's nothing else to do but to expand our consciousness, and this a means to that end. An organized, ordered world where we can think and interact in such a way that allows us to advance our understanding of the world around us.

May your dreams set you free.

Appendix: Relevant Terminology

Philosophy

Philosophy (from Ancient Greek philosophía lit. 'love of wisdom') is a systematic study of general and fundamental questions concerning topics like existence, knowledge, mind, reason, language, and value. It is a rational and critical inquiry that reflects on its methods and assumptions.

Ontology

Ontology is the philosophical study of being. It is traditionally understood as the subdiscipline of metaphysics focused on the most general features of reality. As one of the most fundamental concepts, being encompasses all of reality and every entity within it.

Epistemology

Epistemology is the branch of philosophy that examines the nature, origin, and limits of knowledge. Also called the theory of knowledge, it explores different types of knowledge, such as propositional knowledge about facts, practical knowledge in the form of skills, and knowledge by acquaintance as a familiarity through experience. Epistemologists study the concepts of belief, truth, and justification to understand the nature of knowledge. To discover how knowledge arises, they investigate sources of justification, such as perception, introspection, memory, reason, and testimony.

Metaphysics

Metaphysics is the branch of philosophy that examines the basic structure of reality. It is traditionally seen as the study of mind-independent features of the world, but some theorists view it as an inquiry into the conceptual framework of human understanding. Some philosophers, including Aristotle, designate metaphysics as first philosophy to suggest that it is more fundamental than other forms of philosophical inquiry. Metaphysics encompasses a wide range of general and abstract topics. It investigates the nature of existence, the features all entities have in common, and their division into categories of being. An influential division is between particulars and universals. Particulars are individual unique entities, like a specific apple. Universals are general features that different particulars have in common, like the color red. Modal metaphysics examines what it means for something to be possible or necessary. Metaphysicians also explore the concepts of space, time, and change, and their connection to causality and the laws of nature. Other topics include how mind and matter are related, whether everything in the world is predetermined, and whether there is free will. Metaphysicians use various methods to conduct their inquiry. Traditionally, they rely on rational intuitions and abstract reasoning but have recently included empirical approaches associated with scientific theories. Due to the abstract nature of its topic, metaphysics has received criticisms questioning the reliability of its methods and the meaningfulness of its theories. Metaphysics is relevant to many fields of inquiry that often implicitly rely on metaphysical concepts and assumptions.

The beginning of Aristotle's Metaphysics, one of the foundational texts of the discipline

Nondualism

Nondualism, also called nonduality and sometimes monism, is a polyvalent term originating in Indian philosophy and religion, where it is used in various, related contemplative philosophies which aim to negate dualistic thinking or conceptual proliferation (prapanca) and thereby realize nondual awareness, 'that which is beyond discursive thinking', a state of consciousness described in contemplative traditions as a background field of unified, immutable awareness that exists prior to conceptual thought. The English term "nonduality" is derived from the Sanskrit Hindu term "advaita" (अद्वैत), "not-two" or "one without a second," meaning that only Brahman, 'the one', is ultimately real while 'the world', or the multiplicity of thought-constructs, 'the second', is not fully real; and from the Buddhist term advaya, which is also literally translated as "not two" and has various applications, including the Madhyamaka negation of thinking in opposites such as ordinary, conventional truth versus ultimate truth, and in Yogachara the deconstruction of the "apprehension of sensory objects as separate from the perceiving consciousness." A perennialist view posits that nondual awareness, despite fundamental differences in the explanatory frameworks, is a common essence in various religious traditions. According to this view, nondual awareness is not only paradigmatic for Hindu advaita-traditions including Advaita Vedanta and Kashmir Shaivism, and Buddhist advaya-traditions including Yogachara, Madhyamaka, Zen and Dzogchen, but can also be found in Taoist philosophy, and in Western philosophy, Christian mysticism, and Sufism. Nondualism is also used to refer to the satsang movement, also called neo-advaita, for which nonduality is a central tenet, emphasizing sudden awakening or insight. The term may also refer to monism and nonplurality, the idea of a unitive essence behind the multiplicity of distinct entities. Related definitions include interconnectedness

interdependence, and holism or 'wholism', the idea that "all the things "in" the world are not really distinct from each other but together constitute some integral whole." Further definitions are the rejection of thinking in binary opposites such as the mind-body dualism, while "nondualism" is also used as a synonym for mysticism, mystical experience, and spirituality.

Gnosticism

Gnosticism (from Ancient Greek γνωστικός (gnōstikós) 'having knowledge'; Koine Greek: [ɣnosti'kos]) is a collection of religious and philosophical ideas and systems that coalesced in the late first century AD among early Christian sects and the sects of other religions. These diverse groups emphasized personal spiritual knowledge (gnosis) above the authority, traditions, and proto-orthodox teachings of organized religious institutions. The Gnostic worldview generally distinguished between a hidden, uncorrupted supreme being and a flawed demiurge responsible for creating material reality. Gnostics held this material existence to be evil and believed the principal element of salvation to be direct knowledge of the supreme divinity, attained via mystical or esoteric insight. Many Gnostic texts deal not in concepts of sin and repentance, but with illusion and enlightenment.

Gnosis is a feminine Greek noun which means "knowledge" or "awareness". It and the associated verb are often used for personal knowledge, as compared with intellectual knowledge (Greek verb εἶδεν εἶδειν). A related term is the adjective gnostikos, "of or for knowledge", a reasonably common adjective in Classical Greek. Jesus is identified by some Gnostics as an embodiment of the supreme being who became incarnate to bring gnōsis to the earth, while others adamantly denied that the supreme being came in the flesh, claiming Jesus to be merely a human who attained enlightenment through gnosis and taught his disciples to do the same. Others believed that Jesus was divine but did not have a physical body, reflected in the later Docetist movement. Among the Mandaeans, Jesus was considered a mšiha kdaba or "false messiah" who perverted the teachings entrusted to him by John the Baptist. Still other traditions identify Mani, the founder of Manichaeism, and Seth, third son of Adam and Eve, as salvific figures.

Gnosis

Gnosis is the common Greek noun for knowledge (γνώσις, gnōsis).The term was used among various Hellenistic religions and philosophies in the Greco-Roman world. It is best known for its implication within Gnosticism, where it signifies a spiritual knowledge or insight into humanity's real nature as divine, leading to the deliverance of the divine spark within humanity from the constraints of earthly existence. Gnosis is a feminine Greek noun which means "knowledge" or "awareness." It is often used for personal knowledge as opposed to intellectual knowledge (εἶδεν εἶδειν), as with the French connaître compared with savoir, the Portuguese conhecer compared with saber, the Spanish conocer compared with saber, the Italian conoscere compared with sapere, the German kennen rather than wissen, or the Modern Greek γνωρίζω compared with ξέρω. A related term is the adjective gnostikos, "cognitive", a reasonably common adjective in Classical Greek. The terms do not appear to indicate any mystic, esoteric or hidden meaning in the works of Plato, but instead expressed a sort of higher intelligence and ability analogous to talent.

Monism

Monism attributes oneness or singleness (Greek: μόνος) to a concept, such as to existence. Various kinds of monism can be distinguished:

- Priority monism states that all existing things go back to a source that is distinct from them; e.g., in Neoplatonism everything is derived from The One. In this view only the One is ontologically fundamental or prior to everything else.
 - Existence monism posits that, strictly speaking, there exists only a single thing, the universe, which can only be artificially and arbitrarily divided into many things.
 - Substance monism asserts that a variety of existing things can be explained in terms of a single reality or substance. Substance monism posits that only one kind of substance exists, although many things may be made up of this substance, e.g., matter or mind.
 - Dual-aspect monism is the view that the mental and the physical are two aspects of, or perspectives on, the same substance.
 - Neutral monism believes the fundamental nature of reality to be neither mental nor physical; in other words it is "neutral".
 - Political monism is sometimes used to describe political concepts, such as unitarianism, based on certain principles like ethnicity or identity. There are two sorts of definitions for monism:
 - The wide definition: a philosophy is monistic if it postulates unity of the origin of all things; all existing things return to a source that is distinct from them.
 - The restricted definition: this requires not only unity of origin but also unity of substance and essence.
- Although the term monism is derived from Western philosophy to typify positions in the mind-body problem, it has also been used to typify religious traditions. In

modern Hinduism, the term "absolute monism" has been applied to Advaita Vedanta, though Philip Renard points out that this may be a Western interpretation, bypassing the intuitive understanding of a nondual reality. It is more generally categorized by scholars as a form of absolute nondualism.

The circled dot was used by the Pythagoreans and later Greeks to represent the first metaphysical being, the Monad or The Absolute.

Neoplatonism

Neoplatonism is a version of Platonic philosophy that emerged in the 3rd century AD against the background of Hellenistic philosophy and religion. The term does not encapsulate a set of ideas as much as a series of thinkers. Among the common ideas it maintains is monism, the doctrine that all of reality can be derived from a single principle, "the One". The Enneads of Plotinus are the primary and classical document of neoplatonism. As a form of mysticism, it contains theoretical and practical parts. The theoretical parts deal with the high origin of the human soul, showing how it has departed from its first estate. The practical parts show the way by which the soul may again return to the Eternal and Supreme. The system can be divided between the invisible world and the phenomenal world, the former containing the transcendent, absolute One from which emanates an eternal, perfect, essence (nous, or intellect), which, in turn, produces the world-soul.

Mysticism

Mysticism encompasses religious traditions of human transformation aided by various practices and religious experiences. Popularly, mysticism is used synonymously with mystical experience, a neologism which refers to an ecstatic unitive experience of becoming one with God, the Absolute, or all that exists. Broadly defined, mysticism as a way of personal transformation can be found in a number of religious traditions, including Western mysticism and Western esotericism, Sufism, Buddhism, and Hinduism.

Magic

Magic, sometimes spelled magick,is the application of beliefs, rituals or actions employed in the belief that they can manipulate natural or supernatural beings and forces. It is a category into which have been placed various beliefs and practices sometimes considered separate from both religion and science.

Magick

Ceremonial magic (also known as magick, ritual magic, high magic or learned magic) encompasses a wide variety of rituals of magic. The synonym magick is an archaic spelling of 'magic' used during the Renaissance, which was revived by Aleister Crowley to differentiate occult magic from stage magic. He defined it as "the Science and Art of causing Change to occur in conformity with Will", including ordinary acts of will as well as ritual magic. Crowley wrote that "it is theoretically possible to cause in any object any change of which that object is capable by nature". Crowley saw magic as the essential method for a person to reach true understanding of the self and to act according to one's true will, which he saw as the reconciliation "between freewill and destiny."

Thelema

Thelema is a Western esoteric and occult social or spiritual philosophy and a new religious movement founded in the early 1900s by Aleister Crowley (1875–1947), an English writer, mystic, occultist, and ceremonial magician. Central to Thelema is the concept of discovering and following one's True Will, a divine and individual purpose that transcends ordinary desires. Crowley's system begins with The Book of the Law, a text he maintained was dictated to him by a non-corporeal entity named Aiwass. This work outlines key principles, including the axioms "Do what thou wilt shall be the whole of the Law" and "love is the law, love under will", emphasizing personal freedom and the pursuit of one's true path. Magick is a central practice in Thelema, involving various physical, mental, and spiritual exercises aimed at uncovering one's True Will and enacting change in alignment with it. Practices such as rituals, yoga, and meditation are used to explore consciousness and achieve self-mastery.

Idealism

Idealism in philosophy, also known as philosophical idealism or metaphysical idealism, is the set of metaphysical perspectives asserting that, most fundamentally, reality is equivalent to mind, spirit, or consciousness; that reality or truth is entirely a mental construct; or that ideas are the highest type of reality or have the greatest claim to being considered "real". Because there are different types of idealism, it is difficult to define the term uniformly. Indian philosophy contains some of the first defenses of idealism, such as in Vedanta and in Shaiva Pratyabhijñā thought. These systems of thought argue for an all-pervading consciousness as the true nature and ground of reality. Idealism is also found in some streams of Mahayana Buddhism, such as in the Yogācāra school, which argued for a "mind-only" (cittamatra) philosophy on an analysis of subjective experience. In the West, idealism traces its roots back to Plato in ancient Greece, who proposed that absolute, unchanging, timeless ideas constitute the highest form of reality: Platonic idealism. This was revived and transformed in the early modern period by Immanuel Kant's arguments that our knowledge of reality is completely based on mental structures: transcendental idealism. Epistemologically, idealism is accompanied by a rejection of the possibility of knowing the existence of any thing independent of mind. Ontologically, idealism asserts that the existence of all things depends upon the mind; thus, ontological idealism rejects the perspectives of physicalism and dualism. In contrast to materialism, idealism asserts the primacy of consciousness as the origin and prerequisite of all phenomena.

Transcendental Idealism

Transcendental idealism is a philosophical system founded by German philosopher Immanuel Kant in the 18th century. Kant's epistemological program is found throughout his Critique of Pure Reason (1781). By transcendental (a term that deserves special clarification) Kant means that his philosophical approach to knowledge transcends mere consideration of sensory evidence and requires an understanding of the mind's innate modes of processing that sensory evidence. In the "Transcendental Aesthetic" section of the Critique of Pure Reason, Kant outlines how space and time are pure forms of human intuition contributed by our own faculty of sensibility. Space and time do not have an existence "outside" of us, but are the "subjective" forms of our sensibility and hence the necessary a priori conditions under which the objects we encounter in our experience can appear to us at all. Kant describes time and space not only as "empirically real" but transcendently ideal. Kant argues that the conscious subject recognizes the objects of experience not as they are in themselves, but only the way they appear to us under the conditions of our sensibility. This fits his model of perception outlined at the outset of the "Transcendental Aesthetic" by which he distinguishes the empirical reality of appearances studied by the empirical sciences from the noumenal reality of things as they are in themselves, independent of empirical observation. Thus Kant's doctrine restricts the scope of our cognition to appearances given to our sensibility and denies that we can possess cognition of things as they are in themselves, i.e. things as they are independently of how we experience them through our cognitive faculties.

Perennial philosophy

The perennial philosophy (Latin: philosophia perennis), also referred to as perennialism and perennial wisdom, is a school of thought in philosophy and spirituality that posits that the recurrence of common themes across world religions illuminates universal truths about the nature of reality, humanity, ethics, and consciousness. Some perennialists emphasize common themes in religious experiences and mystical traditions across time and cultures; others argue that religious traditions share a single metaphysical truth or origin from which all esoteric and exoteric knowledge and doctrine have developed. Developments in the 19th and 20th centuries integrated Eastern religions and universalism—the idea that all religions, underneath apparent differences, point to the same Truth. In the early 19th century, the Transcendentalists propagated the idea of a metaphysical Truth and universalism—this inspired the Unitarians, who proselytized among Indian elites. Toward the end of the 19th century, the Theosophical Society further popularized universalism in the Western world and Western colonies. In the 20th century, this form of universalist perennialism was further popularized by Aldous Huxley and his book *The Perennial Philosophy*, which was inspired by Neo-Vedanta. Huxley and some other perennialists grounded their point of view in the commonalities of mystical experience and generally accepted religious syncretism. Perennialists often ground their position in what they call a "common core" of religious wisdom which is found across traditions. They argue that since many of these themes developed independent of contact between the cultures concerned, they are likely to point to deeper truths from anthropological, phenomenological and/or metaphysical perspectives. Perennialists generally make a distinction between the exoteric and esoteric dimensions of the various religions, arguing that the exoteric doctrinal differences are cultural in nature, but that the mystical traditions of these religious use the language of these doctrines and cultural forms to express identical or similar things.

One of two known editions of the title page of William Blake's *All Religions are One*, published in 1795

Skepticism

Skepticism (US) or scepticism (UK) is a questioning attitude or doubt toward knowledge claims that are seen as mere belief or dogma. For example, if a person is skeptical about claims made by their government about an ongoing war then the person doubts that these claims are accurate. In such cases, skeptics normally recommend not disbelief but suspension of belief, i.e. maintaining a neutral attitude that neither affirms nor denies the claim. This attitude is often motivated by the impression that the available evidence is insufficient to support the claim. Formally, skepticism is a topic of interest in philosophy, particularly epistemology.

Solipsism

Solipsism (/ˈsɒlɪpsɪzəm/ SOLL-ip-siz-əm; from Latin solus 'alone' and ipse 'self') is the philosophical idea that only one's mind is sure to exist. As an epistemological position, solipsism holds that knowledge of anything outside one's own mind is unsure; the external world and other minds cannot be known and might not exist outside the mind. There are varying degrees of solipsism that parallel the varying degrees of skepticism:

- Metaphysical solipsism** is a variety of solipsism based on a philosophy of subjective idealism. Metaphysical solipsists maintain that the self is the only existing reality and that all other realities, including the external world and other persons, are representations of that self, having no independent existence. There are several versions of metaphysical solipsism, such as Caspar Hare's egocentric presentism (or perspectival realism), in which other people are conscious, but their experiences are simply not present.
- Epistemological solipsism** is the variety of idealism according to which only the directly accessible mental contents of the solipsistic philosopher can be known. The existence of an external world is regarded as an unresolvable question rather than actually false. Further, one cannot also be certain as to what extent the external world exists independently of one's mind. For instance, it may be that a God-like being controls the sensations received by the mind, making it appear as if there is an external world when most of it (excluding the God-like being and oneself) is false. However, the point remains that epistemological solipsists consider this an "unresolvable" question.
- Methodological solipsism** is an agnostic variant of solipsism. It exists in opposition to the strict epistemological requirements for "knowledge" (e.g. the requirement that knowledge must be certain). It still entertains the points that any induction is fallible. Methodological solipsism sometimes goes even further to say that even what we perceive as the brain is actually part of the external world, for it is only through our senses that we can see or feel the mind. Only the existence of thoughts is known for certain. Methodological solipsists do not intend to conclude that the stronger forms of solipsism are actually true. They simply emphasize that justifications of an external world must be founded on indisputable facts about their own consciousness. The methodological solipsist believes that subjective impressions (empiricism) or innate knowledge (rationalism) are the sole possible or proper starting point for philosophical construction. Often methodological solipsism is not held as a belief system, but rather used as a thought experiment to assist skepticism (e.g. René Descartes' Cartesian skepticism).

Pragmatism

Pragmatism is a philosophical tradition that views language and thought as tools for prediction, problem solving, and action, rather than describing, representing, or mirroring reality. Pragmatists contend that most philosophical topics—such as the nature of knowledge, language, concepts, meaning, belief, and science—are best viewed in terms of their practical uses and successes. Pragmatism began in the United States in the 1870s. Its origins are often attributed to philosophers Charles Sanders Peirce, William James and John Dewey. In 1878, Peirce described it in his pragmatic maxim: "Consider the practical effects of the objects of your conception. Then, your conception of those effects is the whole of your conception

of the object."

James and Dewey were empirical thinkers in the most straightforward fashion: experience is the ultimate test and experience is what needs to be explained. They were dissatisfied with ordinary empiricism because, in the tradition dating from Hume, empiricists had a tendency to think of experience as nothing more than individual sensations. To the pragmatists, this went against the spirit of empiricism: we should try to explain all that is given in experience including connections and meaning, instead of explaining them away and positing sense data as the ultimate reality. Radical empiricism, or Immediate Empiricism in Dewey's words, wants to give a place to meaning and value instead of explaining them away as subjective additions to a world of whizzing atoms.

Radical empiricism gives answers to questions about the limits of science, the nature of meaning and value and the workability of reductionism. These questions feature prominently in current debates about the relationship between religion and science, where it is often assumed—most pragmatists would disagree—that science degrades everything that is meaningful into "merely" physical phenomena.

Brazilian social thinker Roberto Unger advocates for a radical pragmatism, one that "de-naturalizes" society and culture, and thus insists that we can "transform the character of our relation to social and cultural worlds we inhabit rather than just to change, little by little, the content of the arrangements and beliefs that comprise them". Late Rorty and Jürgen Habermas are closer to Continental thought.

TriumphantGeorge Compendium - Part 34

POST: Is life necessary for consciousness? (r/TrueAskReddit)

[POST]

[https://www.nytimes.com/2007/11/18/magazine/18wwIn-lede-t.html?_r=2&] This article on panpsychism talks about how we don't really know what causes consciousness and that it could simply be an effect of universal forces on an object. Do you think intelligence, or even life, is necessary for consciousness?

[END OF POST]

Consciousness is primary, I'd say. It's not that things are conscious, it's that **everything is in consciousness**. That is different to self-consciousness, though, which is just a thought-about yourself.

Q: So you are saying that rocks, trees, stars, planets, etc. are all conscious? What definition are you using here for consciousness? The normal definition given in the dictionary for consciousness is: "The state of being aware of and responsive to one's surroundings."; How have you determined that everything is "in consciousness"?

No, they are not "conscious", they appear "in consciousness" and are made from it. (Reflective consciousness is one part of experience appearing within another.)

So, instead of treating matter as fundamental, we say that consciousness is fundamental: it is the 'space' in which everything arises, and everything is made from it. You can experience this yourself, directly. Your experiences are made from consciousness. Then you ask: Where is the "me" that is conscious of the experience I am having? And: How is it possible for something other than consciousness to appear/encroach on consciousness? Or rather: How can we talk about what is beyond our experience? Basically, you just switch round from saying that matter is fundamental ('stuff' in space) to saying that consciousness is fundamental ('patterns' rather than things). Philosophical idealism + non duality. Try this thought experiment [Outside: The Dreaming Game].

Q: "No, they are not "conscious", they appear "in consciousness" and are made from it. (Reflective consciousness is one part of experience appearing within another.); You have failed to answer what appears to be a fundamental question for conversation. I repeat: What definition are you using here for consciousness? The normal definition given in the dictionary for consciousness is: "The state of being aware of and responsive to one's surroundings."; How have you determined that everything is "in consciousness"?

Apologies. The wikipedia definition is better:

Consciousness is the quality or state of awareness, or, of being aware of an external object or something within oneself. It has been defined as: sentience, awareness, subjectivity, the ability to experience or to feel, wakefulness, having a sense of selfhood, and the executive control system of the mind. Despite the difficulty in definition, many philosophers believe that there is a broadly shared underlying intuition about what consciousness is. As Max Velmans and Susan Schneider wrote in The Blackwell Companion to Consciousness: "Anything that we are aware of at a given moment forms part of our consciousness, making conscious experience at once the most familiar and most mysterious aspect of our lives."

So, basically, the definition of "consciousness" is "awareness of something" or "that which is aware", or more simply: "awareness".

- **Direct Experience:** That everything (all experience) is in consciousness is something you can prove to yourself. If you try the experiment I pointed out, you find that - in your own direct experience - everything is within a space of awareness, and that you yourself seem to be that 'space'. Objects you experience turn out to be patterns within awareness. One supposes an external world made of matter, but one never experiences it, and one would have to invent a "conversion bridge" where the matter of objects was "converted" into the experience made of awareness.
- **Philosophical Basis:** The question of what is consciousness can equally be asked of matter. It's a case of which you choose to be fundamental. However, materialism has the problem of "how does consciousness arise from inert matter?" whereas idealism has no problem with answering "how does the experience of inert matter arise from consciousness". Consciousness is the "material" that things are made from. "Matter" are patterns/folds in consciousness.

The result is that, everything experiences "being itself". That does not mean it is self-aware - rocks do not "know" that they are rocks. However, rocks are a rock-like experience. Something like the brain, a much more complex pattern, has a more complex relationship within itself: parts of the brain can "experience" themselves relative to other parts of the brain (or rather, "experience patterns within themselves", such as seeing, hearing and so on). If the brain was "inert matter" we'd have to find the time/location at which consciousness appeared or emerged. If 'matter' is made from consciousness, then that problem is solved: consciousness experiences itself relative to itself, and objects and patterns within itself. Is life necessary for consciousness? No, consciousness is already present for life to appear within / arise from / be a pattern within.

TL;DR: Consciousness is not emergent, it is fundamental. Life is conscious because all forms are conscious. Increased complexity gives organisms the ability to have the experience of self-consciousness.

Q: Thank you for your response. Is this essentially the problem of hard solipsism? So a rock is not something that exists objectively but only subjectively? If all things are simply experiences of things with consciousness, then how do you explain the experiences being so similar for different things with consciousness? Why wouldn't they have completely different experiences?

It's a good point, and important. It's a bit "waves and the ocean". We are not talking about your personal consciousness - what you refer to as the content of your consciousness is really a pattern within the larger consciousness. Meanwhile, "everything is one", but waves don't necessarily get to see inside other waves, they only experience ripples that get into their own volume. I tried to formulate a metaphor further down, here.

[COMMENT]

Two major possibilities for this, i.e. assuming the least:

- **We are all one with the universe.** As Alan Watts said it perfectly, "As the ocean waves, the universe peoples." We are the universe experiencing itself. We are all extensions of the same thing. I actually lean towards this belief more, and even created a sub /r/UnitedWeStand around this idea. To quote Alan Watts again: We do not "come into" into this world; we come out of it, as leaves from a tree. We all come from the same conscious entity or universe, that has spread out into people.
- *We are just here by chance.* The universe is huge, and through several billion years, we were formed out of it. There is no meaning to anything. We are not really alive. Science has never defined life or consciousness. All points to the likely hood that we are no different than a machine, that has fooled itself into believing that it is "alive". Why? Because frankly the alternative belief sucks. No one likes to believe that they are not special, no one wants to accept the idea that there is no purpose to life, no one really wants to admit to the fact that there is no one out there or within - no God, just pure nothingness - if you actually were to sincerely believe that, it is a scary thought. You are a lifeless matter that is strictly just chemicals interacting with each other. You are what you were before you were born - which is nothing - you just didn't exist. I mean, there was no evidence that there is consciousness before life started on this planet, so what makes us believe that it is actually something real? If you base it completely on science, there is really no need for a consciousness because everything is explainable without it. And frankly, the more you study the human body, the more we realize how similar we are to robots, and how much of what we take for granted as "consciousness" or "you" is just a biological machine.

These are the two possibilities I have come to, and either one is a good belief to hold. However, I lean towards the more optimistic vision, because frankly mankind is an incredible species, and it is difficult to imagine that what we are now, is merely order out of chaos, and nothing more.

[END OF COMMENT]

Nice quote on Alan Watts. I agree with this. I think "consciousness" is fundamental, and that pattern and form (including us) emerges from it. The analogy of the blanket, where the blanket is "raw awareness" and ripples are "objects", is quite apt. How does the universe know itself? A blanket with no ripples could not experience itself, relative to itself. Only by 'taking on shapes' can consciousness experience itself. **We are such shapes.** And our "self-awareness" is actually consciousness experiencing the folds within our human perimeter - what we actually are is not any of the things we experience, we are 'the space within which experiences arise'. (Just as the brain cannot experience itself from outside its perimeter, but can experience the things which occur within it, including a conception of itself.)

Think of a vast open space. This is raw, impersonal, open, unbounded, unstructured consciousness/awareness. Now within that, we have 3d structured space as a light 'ripple' or pattern. And within that, we have numerous objects and people - all as patterns in consciousness. Our brains and nervous systems are such patterns. Our experience is of the content of our brains, the folded consciousness within the brain. The brain cannot experience itself, of course, because that would require being "outwith itself", but it can experience the patterns occurring within it. Our conception of ourself occurs within and as one of these patterns ("self" consciousness). Which, incidentally, is why your "self" is an illusion. In your direct experience right now, you can actually "feel out" in all directions and realise that there is a "space of awareness" in which all content appears, including your experience of your "self". What you 'really are' is the space (seen as 'a brain' in the 3rd person); the "self" you think you are is a thought/concept/pattern within that space. But that's how you join the two perspectives. Look around you right now: your experience is that of a 'dream space' in which objects appear as patterns in the space. (You might find my blog entry here of interest, and the links it points to, to emphasise this point.)

That fact that one person (localised pattern) can't 'see into' another person (localised pattern) doesn't mean that there is only "you" or that you aren't both arising from the same background material-that-is-consciousness. Furthermore, rocks aren't "in you" so much as they are "in consciousness" and their pattern creates a pattern within "you", which you experience.

TL;DR: It's not a personal consciousness, so solipsism isn't a problem. Furthermore, just because everything is consciousness, don't mean that one being should be able to directly experience that of another being.

Q: "Think of a vast open space. This is raw, impersonal, open, unbounded, unstructured consciousness/awareness."; I think that your use of words is losing me again. If everything is "made" from "awareness", what is the thing that is "aware"? From what I'm reading it sounds like you're saying that "awareness" (the material that everything is made from) is "aware" (experiences) itself. It seems like you've created a circular system where awareness creates itself. How is that not the case? Or if it is, doesn't that

Yes, awareness is self-aware. Awareness experiences itself. When it forms into a pattern, it is the pattern and it experiences the pattern.

- **Crude analogy:** The skin on your hand is "aware" but it can only experience itself by touching something. A hand held without contacting anything is "awareness" without content. A hand touching a table now has a sensation within awareness, it has content.

I try to indicate this with the "blanket" analogy in the other comment. Remember: We begin with this open awareness. Then it folds into patterns to form the content of awareness. Awareness experiences "itself" by forming into content and experiencing the content.

What reason do you have for thinking that this "awareness", that is self-creating/self-sustaining and produces the effects that we call the universe, actually exists? Or is this all simply a thought experiment?

To contrast: What makes you think "matter" exists? Have you ever experienced "matter"? I'll answer though: because you can directly experience it [awareness], right now. In fact, it's the only thing you can truly know exists. Everything else is inferred or thought-about. Again: it is the only thing you know, and that it is fundamental is the only way to explain it.

The Experiment

To be done from a 1st person perspective. In other words, don't think about it; imagine it actually happening to you, like imagining the feel of putting on a hat:

- Sit comfortably. Now imagine turning off your senses one by one:
- Turn off vision. Are you still there?
- Turn off sound. Still there?
- Turn off bodily sensations, such as the feeling of the chair beneath you. Uh-huh?
- Turn off thoughts. Where/what are you now?
- Some people are left with a fuzzy sense of being "located". This is just a residual thought. Turn that off too.

You're still there, you realise; you are a wide-open "aware space" in which those other experiences appeared. You know that you are, and what is within you, although you can never apprehend yourself.

Fair question. I think matter exists because I trust my senses to give a mostly accurate understanding of the world external to my body.

But you don't experience matter, do you? You experience sights, sounds, sensations, and so on. You might have a concept called "matter" and say that's what is "behind the scenes", but you don't experience it.

Either I asked my question poorly or you are sidestepping it.

I think I see where you are coming from there. Okay, I'll try again and maybe tell me which bits aren't making sense?

I say: All that you truly know exists, is awareness. Everything you experience, including your experience of a "little self", also appears to be made of awareness. The only thing you ever experience is awareness. Can you imagine ever experiencing something that is not made of awareness? What would that something be made of instead? This is why I say that it is the basis of all things, because it is all I or anyone else has every experienced. Itself, awareness is not an "object" and so isn't experienced as a "thing", but the patterns it forms are experienced as "things" that I experience. **Solipsism isn't a problem**, because having established that things are made of awareness, are patterns in awareness, I am not saying that one pattern (brain) has access to the internals of other patterns (brains), however I might reasonably infer from observed behaviour and how it corresponds with my own behaviour that others of similar form have a similar experience to my own - as partial patterns in the larger awareness.

So again, I have to ask. What makes you think that this "consciousness/awareness" which you are saying is the basis of all things actually exists?

Short answer: From my direct experience. I actually experience this background directly, right now. If I point 'my attention' in the direction opposite to the way my eyes are looking, I experience a big, non structured space that goes on forever (where my "head" would be). Anything else I can conceive of is also made of this; I can't conceive of something not-awareness. Strictly speaking, only the content of awareness "exists", because unstructured open awareness without pattern isn't an "object" or "thing", it just "is".

Thank you that was actually much clearer. So based on your response, are you a metaphysical solipsist? And if not, why not?

No. Solipsism would say "there is only me". I would say: There is not even me (as a separate individual as we would normally conceive of it). Solipsism would say "no reality exists other than one's own mind". I would say, "reality exists in a larger mind [so to speak], of which this localised perspective is but a part, a pattern within it". However, I admit the problem of intersubjectivity, that as a "wave" I don't experience the content of other waves, only the fundamental background going on forever and the patterns which appear within this localised "whirlpool" of "my" experience, some of which are the experience of the patterns of other waves.

EDIT: In other words, I am inferring that this is not a state of subjective idealism.

[QUOTE]

Subjective idealism

Subjective idealism, or empirical idealism or immaterialism, is a form of philosophical monism that holds that only minds and mental contents exist. It entails and is generally identified or associated with immaterialism, the doctrine that material things do not exist. Subjective idealism rejects dualism, neutral monism, and materialism; it is the contrary of eliminative materialism, the doctrine that all or some classes of mental phenomena (such as emotions, beliefs, or desires) do not exist, but are sheer illusions. This form of idealism is "subjective" not because it denies that there is an objective reality, but because it asserts that this reality is completely dependent upon the minds of the subjects that perceive it.

[END OF QUOTE]

Q: Solipsism would say "there is only me". I would say: There is not even me (as a separate individual as we would normally conceive of it). No, metaphysical solipsism would say that the only things that exist are the experiences in your mind, which you've already stated are the only things that you know to exist. I would say, "reality exists in a larger mind [so to speak], of which this localised perspective is but a part, a pattern within it". Ok, why do you think that more than your experiences exist?

See my edit - I admit this. Actually, it's currently the subject of some discussion. So my previous comment is my "where it's at, temporarily" position. Even access to other's thoughts, for instance, those thoughts or intuitions would appear within 'this open space of awareness'. Based on evidence alone, it is perfectly reasonable to say: "In this dream-space, everything is awareness, and everyone, including 'little me', is a 'dream character' - it just so happens experience takes the perspective of 'little me'."

EDIT: Perhaps that's an interesting area: The usual argument against solipsism is that people behave as if there are other people. In my view there are not even other people, because there is not even me. So you would still interact with other characters, because you are having fun 'playing the part of your character', whilst really being 'wide open space'. In fact, you are all the characters, fundamentally, on a sort of "time share" basis...

QUESTION: If you are the dream, then does solipsism go away as a problem?

So from my perspective you...

We are in agreement. One might say we make "assumption of convenience", simply because it's nicer to live life that way. I assume I am a "person" when I am not - the "person" I am is an idea that is experienced occasionally in awareness - and I assume there are "other people" because it's nicer than if there are not.

How do you go from, the only things that I know to exist are my experiences and I'm assuming that there are things that exist independently of those, to and those things made of awareness that is aware of itself?

I am on solid ground with the "all there is, is awareness", because supposing an "external reality" it would have to be made of the same thing. In other words, I know "my" own experience is made from awareness, so even if my experience is affected causally by patterns outwith my direct experience, they must also be made of awareness in order to have an effect. However, it is true that patterns could simply arise "uncaused" within this 'open space', or with myself as first cause. So whether there are such outwith-patterns is like the case with other persons. The basic provable position is that of **subjective idealism + non dualism**:

- There is an open space of unstructured awareness.
- **What I "really am" is awareness.**
- Content that appears within that space (the "world") is patterns in and of awareness.
- This includes the concept of being a "person", which is simply patterning thought on top.

The rest are niceties, overlaid. So non-personal solipsism is the fundamental starting point: There might be nobody else, but there's no me either. From there, we infer. But our inferences are experienced directly - if they are accepted we do actually experience them directly as true rather than experiencing and thinking so. The thoughts are overlaid.

EDIT: "Aware of itself?" That's not quite right maybe. Nothing is aware of itself. A space of awareness could only be aware of patterns within itself. Perhaps "aware of being the pattern it as formed" is a better phrasing? There's no subject/object as such. Hmm: language!

Q: I know "my" own experience is made from awareness, so even if my experience is affected causally by patterns outwith my direct experience, they must also be made of awareness in order to have an effect. This is the part that interests me the most about your position. How have you satisfied yourself that other things than yourself, are made of consciousness? That they must by made of it?

Well, by exploring my direct experience. Not thinking-about but directly attending-to, I can confirm that my current experience is made directly of consciousness/awareness. All objects, all thoughts, all sensations. There is nothing else. So, what else could there be? Other than things I imagine. Which will then themselves be patterns in and of awareness. In other words, if there is something outwith my direct experience, affecting it, to do so it must also be made of awareness.

EDIT: In a way, the overall notion isn't much of a big deal. We are simply inserting "awareness/consciousness" as a fundamental level, such that stuff such as "matter" are patterns in consciousness. Much of the world-view remains identical, with some of the same philosophical problems (solipsism), reconfigured. But the mind-body problem goes away.

Adding to this with a little summary.

What I Know

From direct observation:

- What I am is an unbounded open 'dream-space' which is aware/awareness.
- That space takes on the shape of experiences. Experiences are made from awareness, are patterns in awareness.
- Those experiences tend to be in terms of a particular 'perspective'.
- One of those experiences is the concept of "TriumphantGeorge" which arises from time to time. Upon investigation, "TriumphantGeorge" is just an idea, an occasional thought. "TriumphantGeorge" is effectively a 'dream character' in the dream.
- **I am in fact the 'dream space' and the content of the 'dream'.**
- **Experience is impersonal.**

What I Conclude

It follows that:

- I never experience anything other than awareness. I cannot conceive of anything that is not awareness.
- I can never perceive anything outwith awareness. I cannot imagine how something that is not awareness could cause a change in awareness.
- I conclude that all that is, is awareness / patterns of awareness.
- I conclude that there is no "external solid world" beyond awareness.

What I Infer

For life convenience:

- That other 'dream characters' are similar in nature to "TriumphantGeorge".
- I treat "TriumphantGeorge" as a legitimate person and do the same for other people, because it's nicer that way. Also, according to what I know - that I am the 'dream space' and all that appears in it - they are a part of me anyway, just as "TriumphantGeorge" is.

Extra Stuff

This obviously impacts the notions and utility of:

- Intention, free will, cause and effect, etc...

...

Is life necessary for consciousness? Question over at TrueAskReddit. I've offered a couple of responses myself.

Without consciousness you could not be alive. Consciousness is life.

But, the question was the other way around. Can there be consciousness without life. As in, if there were no people and no animals and no plants, would there / could there still be consciousness? Fundamental to idealism.

The Solar System formed 4.6 billion years ago from the gravitational collapse of a giant molecular cloud. It is safe to say that 5 billion years ago there was no consciousness, unless you want to believe that molecular clouds are conscious. If molecular clouds are conscious, then water is also conscious. So next time you are thirsty, don't drink anything, unless you are a sadist. The brain is a complex collection of material molecules that produces the illusion of consciousness.

Were you there? ;-) You are confusing consciousness with self-consciousness.

Obviously there can. That's what Idealism is. During an NDE people still know that they exist though may not identify with their character. We confuse life with life forms.

Well, obvious to us, but not the person who asked the question in the TrueAskReddit. If you are an (unknowing) materialist, it's quite a perplexing notion.

Consciousness is creating reality in each instant. There is no 4.2 billion years in the past. There is only now. There is just the appaearence of billions of years of "the past". It's interesting how they consider Idealism to be perplexing but "brain creating consciousness" to be so obvious.

Yes, but it's pretty hard to accept "ideas as primary" just as a concept, when things are so obviously "solid" and "object-y".
